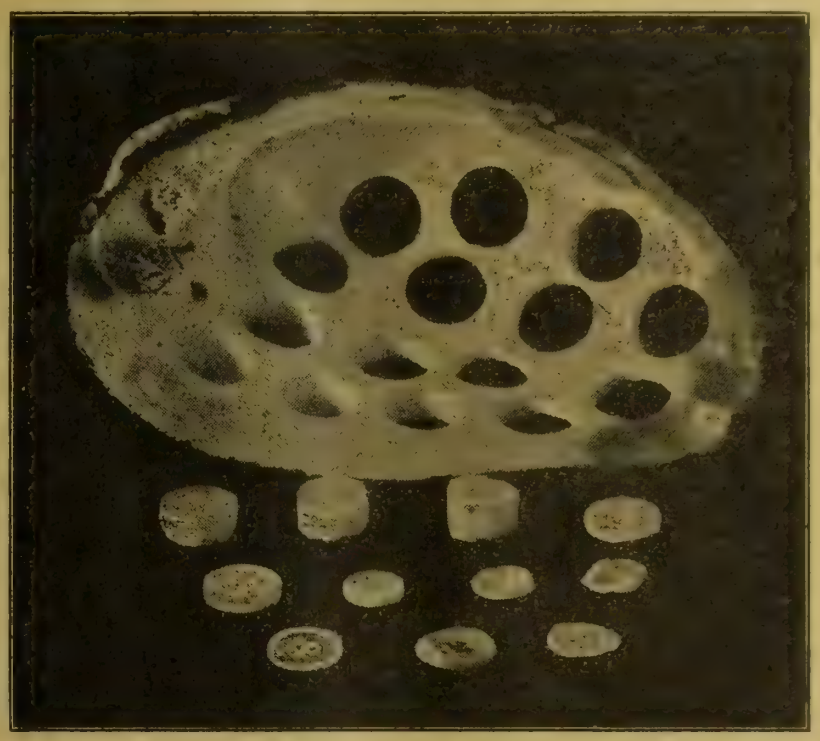
The motto selected for the short course was "Greater Efficiency on the Farms and in the Homes of Maritime Canada," and if one could judge anything from the earnest faces and the enthusiastic spirits of those who attended, one could not but feel hopeful that at least to some etxent the greater efficiency in 1916 will be realized.



CLAM SHELL, AFTER CUTTING; ALSO SHOWING SOME OF THE DISCS REMOVED; SHOWING THICKNESS

Feeding Stuffs Definitions.

Meal is the clean, sound, ground product of the entire grain, cereal or seed which it purports to represent: Provided, that the following meals, qualified by their descriptive names, are to be know as, viz.: Corn germ meal is a product of the manufacture of starch, glocuse and other corn products and is the germ layer from which a part of the corn oil has been extracted. Linseed meal is the ground residue after extraction of part of the oil from ground flaxseed.

Cottonseed meal is a product of the cotton seed only, composed principally of the kernel, with such portions of the hull as is necessary in the manufacture of oil, provided that nothing shall be recognized as cottonseed meal that does not conform to the foregoing definition, and that does not contain at least thirtysix (36) per cent of protein. Choice octtonseed meal must be finely ground, not necessarily bolted, perfectly sound and sweet in odor, yellow, free from excess of lint and must contain at least forty-one per cent of protein. Prime cottonseed meal must be finely ground, not necessarily bolted, of sweet odor, reasonably bright in color, yellow, not brown or reddish, free from excess of lint, and must contain at least thirty-eight and six-tenths (38.6) per cent of protein. Good cottonseed meal must be finely ground, not necessarily bolted, of sweet odor, reasonably bright in color and must contain at least thirty-six per cent of protein.

Cold pressed cottonseed is the product resulting from subjecting the whole undecoricated cottonseed to the cold pressure process for the extraction of oil, and includes the entire cottonseed less the oil extracted. When cold pressed cottonseed is ground it shall be designated as "Ground Cold Pressed Cotton Seed."

Cottonseed feed is a mixture of cottonseed meal and cottonseed hulls containing less than thirty-six per cent of protein.

Grits are the hard flinty portions of Indian corn without hulls and germ.

Hominy meal, hominy fed, or hominy chop is a mixture of the bran coating, the germ and a part of the starchy portion of the corn kernel obtained in the manufacture of hominy grits for human consumption.

Corn feed meal is the sifting obtained in the manufacture of cracked corn and table meal made from the whole grain.

Corn bran is the outer coating of the corn kernel.

Corn gluten feed is that portion of commercial shelled corn that remains after the separation of the larger part of the starch and the germ by the processes employed in the manufacture of corn starch and glocuse. It may or may not contain corn solubles.

Corn gluten meal is that part of commercial shelled corn that remains after the separation of the larger part of the starch, the germ and the bran by the processes employed in the manufacture of corn starch or glucose. It may or may not contain corn solubles.

Wheat bran is the coarse outer coatings of the wheat berry obtained in the usual commercial milling process from wheat that has been cleaned and scoured.

Wheat bran with mill run screenings is pure wheat bran plus the screenings which were separated from the wheat used in preparing said bran.

Wheat bran with screenings not exceeding mill run is either wheat bran with the whole mill run of screenings or wheat bran with a portion of the mill run of screenings, provided that such portion is not an inferior portion thereof.

Shorts, or standard middlings are the fine particles of the outer and the inner bran obtained from bran and white middlings.

Shipstuff, or wheat mixed feed is a mixture of the products other than the flour obtained from the milling of the wheat berry.

Wheat white middlings or white middlings is that part of the offal of wheat intermediate between shorts or standard middlings and red dog.

Red dog is a low grade wheat flour containing the finer particles of the bran.

Oat groats are the kernels of the oat berry with the hulls removed.

Oat shorts are the covering of the oat grain lying immediately inside the hull, being a fuzzy material carrying with it considerable portions of the fine floury part of the groat obtained in the milling of rolled oats.

Oat middlings are the floury portion of the groat obtained in the milling of rolled oats.

Oat hulls are the outer chaffy coverins of the oat grain.

Oat clippings are the hairs, oat dust, ends of oats and light oats separated from the oat kernel by the clipping process.

Clipped oat by-product is obtained in the manufacture of clipped oats. It may contain light chaffy material broken from the ends of the hulls, empty hulls, light immature oats and dust. It must not contain an excessive amount of oat hulls.

Rice hulls are the outer chaffy coverings of the rice grain.

Rice bran is the cuticle beneath the hull.

Rice polish is the finely powdered material obtained in polishing the kernel.

Flax plant by-product is that portion of the flax plant remaining after the separation of the seed, the best fibre and a portion of the shives, and consists of flax shives, flax pods, broken and immature flax seeds and the corticle tissue of the stem.

Buckwheat shorts, or buckwheat middlings is that portion of the buckwheat grain immediately inside the hull after separation from the flour. (Mixtures of buckwheat middlings and buckwheat hulls are often sold as buckwheat middlings or buckwheat shorts. Such materials are regarded as misnamed.)

Blood meal is ground dried blood.

Meat scrap and meat meal are the ground residues from animal tissue exclusive of hoof and bone. If they contain any considerable amount of bone they must be designated meat and bone scrap, or meat and bone meal. If they bear a name descriptive of their kind, composition or origin, they must correspond thereto.

Cracklings are the residue after partially extracting the fats and oils from the animal tissue. If they bear a name descriptive of their kind, composition or origin, they must correspond thereto.

Digester tankage is the residue from animal tissue exclusive of hoof and horn, specially prepared for feeding purposes by tanking under live steam, drying under high heat, and

HORTICULTURE.

Why we Should Prune and the Different Treatment for Old and Young Trees

(Address by M. B. Davis, Ottawa, before the N. S. F. G. A.)

Our talk on pruning this evening will divide itself into three main divisions, first the pruning and training of the young tree before it reaches bearing age, second the pruning treatment of the bearing tree and, third, the best treatment for many of the older, thick planted, high tree orchards that are so common in parts of the valley today.

Perhaps before plunging into our subject it would be well if we asked ourselves why we prune, for there are those who contend that pruning is an injury rather than a help and on the other hand there are those who go to the other extreme and think that butchering their trees is the only treatment worth while.

We prune primarily to obtain better fruit and in so far as our pruning practices help along that one point, just so far is our pruning a success. We do not, or at least should not, prune to obtain a beautiful or sightly tree. A tree possessing beauty alone does not add dollars to our pockets, so that look at it as you may we prune only to obtain better fruit. If left alone, with plenty of room in which to grow, a tree will, all other things being favorable, produce an abundant quantity of fruit, for nature will see to it that her pruning is sufficient to keep the tree in excellent bearing condition, but what of the quality. The quality will invariably be of a low grade, for nature, when it produced the apple, did not have man in mind, but merely produced the fruit as a means of enclosing the seeds in an attractive little parcel which would nurture and protect them until carried and scattered over the face of the earth by some fruit loving animal. Thus we come to the ultimate conclusion that we prune only to obtain better fruit from our trees.

Now, one word more, there is no operation in your orchard which requires greater care or greater thought and study; there is no operation which in the long run has as much to do with your orchard profits as pruning. I sometimes think that we fruit growers have gone clean mad over spraying and some other operations and in our madness have forgotten the first and fundamental road to success, proper pruning.

Some few years ago I had the privilege of being a partner in an orchard not far from here and had the pleasure of working the place for two seasons. While in that orchard I was unable in that short space of time to change things to my own liking, so can readily recall how, while attempting to spray those trees in an endeavor to get a crop of decent fruit, I cussed the man who planted them so closely, who grew them so high and who made them into such thick trees that spraying was a thing imposisble to properly accomplish. To avoid such trees it is necessary, from the very start, to have in mind our ideal tree and once having made up our minds on that point let us stick to it, for the subject should be given such thought at the start that our ideal, although differing from that of a neighbor in some slight degree, is practically correct and feasible for our own conditions.

The different types of trees that we may grow may be roughly divided into three classes. One is the pyramid form; another is the open centre, and the one that I recommend for your conditions, is a combination of the two. The first or pyramidal form,

(Continued on Page 254.)

Handling Fruit in the City.

The average fruit grower would have been greatly benefitted could he have seen and heard the illustrated address of J. C. Orcutt of the Boston chamber of commerce before the recent annual meeting of the Maine pomological society. He clearly outlined the complex course fruit takes after it reaches the city.

"You must remember apples are harvested in four weeks of the year, but only one-twelfth are consumed. There-

Everybody wants to bake—when the

REGAL FLOUR

barrel is opened.

DU PONT FABRIKOID

MOTOR QUALITY

The Standardized Automobile Upholstery

DU PONT Fabrikoid, Motor Quality, is used on more than half of all 1916 automobiles.

Several years' use on hundreds of thousands of cars has proved its superiority over coated splits, commonly called "genuine leather."

Popular motor car prices are low because every detail of their manufacture is of *standard guaranteed* quality and cost.

Coated splits, weak and irregular in quality, durability and price, cannot be standardized.

Motor Quality Fabrikoid, uniform in quality, price, durability and handling costs, *is* standardized.

Insist upon Fabrikoid upholstery. Buy a standardized car and get the most for your money.

Send for samples and booklet No.

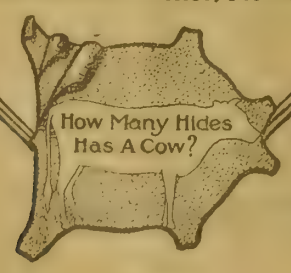
Canadian Sales Office, Toronto



Seeds with a Pedigree mean Money-making Crops

THE first step to intensive farming is to use only *tested seeds* of the best quality, and of varieties especially bred for Canadian climatic conditions. No amount of care in cultivation will produce big yields from inferior seeds. *It is now forty years since*

McDonald's TESTED SEEDS TRUE-VIGOROUS-RELIABLE

were first supplied to Canadian farmers and gardeners. For nearly half a century, season after season, they have been producing money-making crops for those who use them. They have an honest reputation for strong, vigorous germination, and for producing hardy, healthy plants. McDONALD'S Tested Seeds are of strong, pedigreed strains, especially selected for Canadian climatic conditions, and are subjected to rigid tests before being approved for sale.

Get bigger yields per acre by using McDONALD'S Tested Seeds

Hundreds of varieties of field, garden and flower seeds illustrated and described in McDONALD'S Seed Annual. 100 pages, full of valuable information for the farmer or gardner. Write now for your copy, it is free.

Potato Planter

The Eureka line of Potato Planters is the largest manufactured. This machine takes only *one* man to operate it. That means less trouble and expense for *you*.

Opens the furrow—drops the seed any distance or depth required—puts on fertilizer (if desired)—covers up—marks for next row. Always accurate and automatic.

It's an easy machine to operate. The steel and malleable iron construction mean lightest possible weight and increased life of machine. Your repair bill will be practically nothing. Plants uniform depth at *all* times because plow is directly under the axle. Dropping mechanism in plain view of driver. Does not injure seed.

We supply planters in three sizes, for one or two rows—with or without Fertilizer Attachment.

For 16 years the Eureka Potato Planter has been successfully used throughout the world.

We also make Eureka Potato Cutters and the Eureka Mulcher and Seeder—a mulcher, smoothing harrow, cultivator, weeder, seeder.

fore, they must be stored. The average fruit grower does not appreciate the changed conditions in city life. Consumers buy from day to day, and at most from week to week. You cannot sell them an article when they do not want it, any more than you can in a form they do not desire. Probably 80% of the fruit is retailed to working people who buy both cooking and eating apples. They will order a peck or so at a time for cooking and seldom more than a dozen for eating. This is a retail trade and the consumer is supplied at any time and with any quantity by the corner grocery store.

"In greater Boston alone there are upward of 700 chain stores, some of which have as many as 100 stores in a chain. These corner stores carry only a few barrels and are supplied regularly from headquarters by auto truck. They have no facilities for storage and this answers the question of many farmers why they cannot sell direct to the grocery store. City people are not so much interested in the food supply as the farmer thinks. The service is what counts with them and it is impossible for the farmer to begin to compete with the wholesaler in service.

"The fact remains that the bulk of the crop must be sold by a middleman, whether you call him a wholesaler or jobber. You must also remember these people are not doing business for their health. They are going to make their profit whether your produce brings 10 cents or $10. Too many farmers ship in a few barrels of apples and think the commisison man has nothing else to do but hustle around the city and place this consignment. The chances are there are 500 other shipments to be looked after, so it is impossible for any one grower to be singled out for extra profits. Matters are still worse when a grower ships in goods of uncertain quality. For example, if Farmer Jones sends in 25 barrels apples and they are sold by the commission man to Henry Smith's restaurant, there will be trouble if fruit is not what it appeared to be. The commission man must make good with Smith for the does not wish to lose his trade."

Mr. Orcutt made it clear that the average retailer does not wish to buy direct from the farmer. This is for three reasons: The farmer may send too few or too many, credit is not extended and the service does not begin to equal what the middlemen can supply. The illustrations backed by the address of Mr. Orcutt doubly emphasized how complex city distribution of so simple a product as fruit has become. Consumers and retailers have reached the acme of service, but farmers and city people alike pay a heavy toll.

Pruning Orchard Treee.

This work is in order now whenever there is time. Everybody who attempts to prune trees should know enough about them to do the work in a scientific manner. Do not permit them to be butchered or pruned with an axe; use a sharp saw or pruning shears ever time. Before starting to prune a tree, stand back and look the tree over to see what you wish to do with it. It is always best to cut out the dead wood before cutting anything else, because it is then out of the way, and one can better see what green wood should then be cut off. When pruning the orchard, where two limbs are found crossing each other so closely that they rub each other, the weakest or least desirable one ought to be removed. The top needs to be sufficiently open to let the sunlight in to the top; this is necessary so that the fruit may be properly colored up, and the flavor is also much improved by the sunlight.

BABY'S OWN SOAP

Price Need Not Stand in the Way

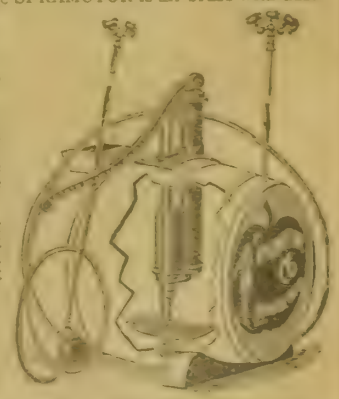
Don't let the question of price prevent you from owning a SPRAMOTOR and getting better crops. We make a SPRAMOTOR as low as $6, and from that all the way up to $400. Our $6 outfit is as good value in proportion as the $400 machine. There's a

Spramotor

It isn't a SPRAMOTOR unless we made it

for every need—the small farmer and the thousand-acre man. The knapsack outfit at the left is all high-grade and sprays at high pressure. We guarantee it to spray paint, whitewash and chemicals. The SPRAMOTOR is all brass with dashing agitator around screen, automatic plunger, brass ball valves and patent hand valve. In galvanized or brass 5 gal. tank.

Barrel outfit consists of all-brass No. 2 SPRAMOTOR with two 10-feet lines of hose, couplings attached, patent hand valves, two bamboo extension rods with brass cupped ends and patent drip guards, two double-nozzle clusters, complete, mounted on 50 gal. cask. Can be used for all kinds of work.



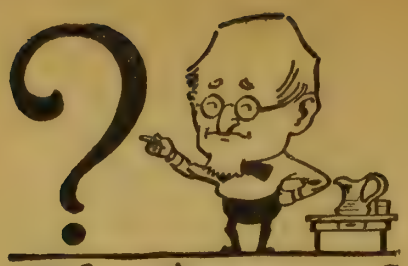
FREE Write us giving some idea of your spraying needs. In return we will mail you without charge a copy of our valuable illustrated treatise on Crop Diseases, also details of a SPRAMOTOR best suited to your requirements.

MADE IN CANADA. NO DUTY TO PAY.

THE LONDON SPRAMOTOR,
2811 King St. East, London, Canada.

In pruning and directing the growth of my earlier set orchard, I trained it low—too low, I now find. True, the wind does not blow off the apples so bad when the limbs are low, but the fruit does not color up so richly or have so nice a flavor as when grown higher up, in the sunshine.

I have a younger orchard, in which I do not intend to let the limbs grow quite so low down; however, I do not wish to be understood as advocating "high up" trees. There is a [illegible] be the most desirable system of training apple trees.—F. H. Dow.



DAIRYING.

Judging the Breeding Powers of an Animal.

In the October 1st issue of Hoard's Dairyman discussion was invited on the probability of a bull calf out of a high producing cow, and sired by a bull out of a high producer, being capable of siring high producing heifers, even though heifers out of his dam by bulls other than his sire were poor producers.

The question has been summed up well in a previous note wihch said that the "productive powers" of the bull in question depended largely on the nicking of his sire and dam. In addition his power of siring high producing heifers also depends on his nicking with the females to which he is bred.

This question of nicking is of great importance, especially amongst Jersey cattle. There are Jerseys of related blood lines which, when bred together, will give excellent results so far as the productive powers of their progeny are concerned, but when these blood lines are bred with certain others the results are, as a rule, disappointing. Blood lines which nick are said to be "warm" to each other and those that do not nick are called "cold."

The two poor half-sisters of the young bull in question do not give much indication as to what his productive powers will be, if, as we said before, his sire and da mnick, and the bull is mated with "warm" blood.

The following table from N. W. Harper shows the chances there are of having good producers as a result of mating good producers—by a good producing bull is meant one that has the inherent capacity of begetting daughters that will give high milk and butterfat yields.

This shows that a bull with either sire or dam in the A. R. O. is much more likely to beget A. R. O. daughters than is one with a sire and dam incapable of meeting A. R. O. requirements. Again, bulls with both sire and dam of A. R. O. calibre are, as a rule, better sires of producers than are bulls with only one parent of great producing ability.

To sum up it may be said that if producers nick they are more apt to beget producers than are nonproducers, but it is very difficult to say definitely that any two animals nick. The only way to tell if two animals will nick by by breeding them, though animals of similar breeding are, as a rule more liable to nick than those that are not.

The advice given in a former issue —to watch the development of the heifers sired by the bull—under discussion is good. Too much emphasis should not be placed upon a comparatively few heifers as they do not afford an absolute guide. It is only when the numbers approach a considerable sum that the evidence may be regarded as conclusive.—L. S. Gillette, in Hoard's Dairyman.

Pastevrizing Milk in Bottles.

In an effort to insure more somplete efficiency in pasteurizing milk, considerable agitation has recently been had with reference to heating the milk in the bottles rather than pasteurizing in bulk and filling bottles after cooling. Prof. Baer of the Wisconsin Experimental Station has made a series of observations, checking the cream line, cooked flavor, and germ content.

With the temperature of the water in the vat at 140 degrees to 150 degrees F. and held for 20 minutes, unsatisfactory bacterial counts were obtained. When, however, the temperature and time of holding of the milk was controlled by a thermometer inverted in a bottle, very satisfatcory bacterial reductions were obtained, even when holding only 20 minutes.

Temperatures of 155 degrees to 165 degrees (water vat) gave better reults bacterially, but the separation of the cream line was much affected at these temperatures, and a cooked flavor noted.

In the studies on bottle pasteurization it was found that unless precautions were taken there was danger of wtaer entering the bottles when they were cooled after pasteurization, due to the formation of a partial vaccuum in the bottle as the milk contracted on cooling. Results of such tests made on unselected bottles showed that leakage occurred with a very large percentage (44 per cent). The leakage will depend on the amount of force applied to the foot lever of the bottle capper, when this type of machine is used, and especially on the condition of the top of the bottle. Water will invariably be drawn into a bottle during the cooling process if it is chipped at the head.—Wisconsin Bulletin 250.

When Butter Won't Gather.

It is sometimes hard to say why butter does not gather properly. We doubt if the fact that the cream is a product of two different breeds of cows has anything to do with it. The trouble more likely lies in methods of handling cream.

Temperature is a big factor in the proper churning and gathering of butter. Generally speaking, the temperature at churning times should range from 58 to 62 degrees. It will pay to buy a dairy thermometer in order to know the temperature of the cream.

There are a good many other factors influencing this point, such as ripening of the cream, the temperature while it is being held and the proper stirring and mixing. Sometimes when there is a small quantity of whey and white particles at the bottom of the cream can, churning is not so satisfactory.

In Examining Udder Look for Length Rather Than Depth.

has been made in increasing the milk production of dual-purpose Shorthorns, the views of the breeders concerning the most desirable shape of udder seem to have undergone a decided change during the past few years. Previously, cows swinging large, pendulous udders somewhat after the Dutch breed frequently gained in favor with judges. Nowadays, however, an udder apparently smaller but more squarely built is first choice. Indeed the breeders in England have of late exhibited a preference for the udder that is designed most closely after the Ayrshire pattern. This is to say that now the udder best liked has length rather than depth, reaches well forward under the flank, and is at nearly level on the underline as it can be.

This shape of udder permits of the teats being placed well apart fore and aft as well as sideways, thus giving better capacity to each of the four

Heart Would Beat Violently.
Nerves Seemed to Be Out of Order.

The heart always works in sympathy with the nerves, and unless the heart is working properly the whole nerve system is liable to become unstrung, and the heart itself become affected.

Milburn's Heart and Nerve Pills will build up the unstrung nervous system, and strengthen the weak heart, so that the sufferer will enjoy the very best of health for years to come.

Mrs. John N. Hicks, Huntsville, Ont., writes: "I am sending you my testimony for the benefit I have received from using Milburn's Heart and Nerve Pills. As a nerve and heart builder they have done wonders for me. At times my heart would beat violently, and my nerves seemed to be all out of order, but after using a few boxes of Milburn's Heart and Nerve Pills I feel like recommending them to others that they might receive benefit as I did."

Milburn's Heart and Nerve Pills have been on the market for the past twenty-five years, and are universally considered to be unrivalled as a medicine for all disorders of the heart or nerves.

Milburn's Heart and Nerve Pills are 50c per box, 3 boxes for $1.25, at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

Maxwell's Limited, St. Marys, Ont.

ADVERTISE IN THE MARITIME FARMER TO GET RESULTS.

quarters into which it is divided by nature. The claim is also made that with an udder of this shape and character a cow can carry a larger yield of milk with greater comfort than if her milk-producing apparatus is bulky and hangs low to the ground.

All the photos of the more recent great young prize winning dual-purpose Shorthorns show them to be furnished with udders very distinctly of the Ayrshire stamp. It is a reasonable enough preference at that, from the standpoint of attractive appearance as well as productive ability.—American Shorthorn Breeders' Association.

Healthier Cows are Direct Results of Thorough Cleaning.

We never knew our cows to do better than after we began to use the curry comb and brush on them as soon as they came into the stable for winter. My father used to keep his cows as sleek as moles. We never had a horse on the farm when I was a boy, but no horse could have had better attention along this line than did the cows and oxen. Seems to me I can see them now, their backs, sides and limbs smooth and gistening from the grooming father had given them.

For a time I did not think so much of this after I had a farm of my own. I was busy fixing up the house and barns and did not have much time anyway to devote to the fine points of dairying, but the time came when I gave this more attention, and I know it pays to keep cattle clean. Every morning I began to give the cows a thorough combing. If we begin at the very outset of the stabling it is not very difficult to keep the cattle free from accumulations of filth which will otherwise cling fast to the sides and flanks. In memory I recall the appearance of my cows as they came from the barn in spring under the old custom. It is no exaggeration to say that some of the cows had loads of manure an inch deep on their flanks, dry, hard and uncomfortable, I have no doubt, to the animal thus encumbered. I am ashamed of it, and still, I was doing things just as my neighbors did, and as many still do.

Now, what does it do for stock to keep them clean? Just this: It makes them healthier and enables them to do better for themselves, which means better for their masters. And this is how: It keeps the pores of the skin open all over the body, and helps to carry away the waste which would otherwise have to be removed in some other way or be dammed up in the animal's carcass. The better the cow's bodily organs do their work the healthier the animal is and that increases the appetite and makes the assimilation better. Anything which makes the cow hearty and thrifty adds to her power to eat food and turn it into flesh, milk and butter fat.

It does not take much time to give the cows this attention if we have begun at the beginning of stabling and keep it up regularly. Only when we skip a few days does the matter become more laborious.

In doing this work I have learned that there is a difference in cows about the matter. Some cows will stop eating and act as if they greatly enjoyed the cleaning up. Others are very sensitive to the touch of the brush, so that we must be careful or they will feel nervous and distressed, perhaps getting more harm than good. A man soon learns about this and ought to be careful to adapt his vim and vigor to the peculiarities of the different cows.

Then, too, cows do not need as much feed if their bodily powers are in good working order. That may seem rather strange to one who has not looked into the subject, but it can easily be proven. In fact, it has been proven. I have done it myself to my decided satisfaction.—J. C. in O. V. Journal.

Results of Continuous Injections of Tuberculin upon Tubercular Cattle.

The veterinary department of the Pullman Agricultural Experiment Station, Washington, carried out a series of experiments to study the effects of subcutaneous injections of tuberculin into cattle in the conditions under which they are generally kept; that is: a fairly well-kept stable in the winter time, being out of doors a part of the day time; and a run to pasture during the summer months, being kept in the barnyard at night.

The first series of experiments were carried out during the year 1900, and the second during 1903-02.

The chief results obtained were the following:

1. The injection into tubercular cattle of large monthly or small weekly doses of tuberculin is apparently without any therapeutic value.

The monthly injections were given as follows: one cow received the first injection of 4 cc. January 14, 1904 and last of 8 cc. Fbruary 13; another cow received her first injection of 44 cc. on January 14, 1904. At each successive injection the dose was doubled till the last reached 2048 cc. on November 25, 1904.

2. The injection of continually increased daily or weekly doses of tuberculin apparently does have a therapeutic value.

The weekly doses began with a 2 cc. and increased every week by 1 cc. With one cow the last dose was 16 cc.; with another 150 cc.

The daily injections were preceded by a weekly injection 2 cc. The period between each succeeding injection was then curtailed by one day until it became daily. On every subsequent day the dose was then increased by 0.5 cc.

3. In tubercular cows the evening temperature is usually higher than the morning temperature.

4. The more often tuberculin injections are made into tubercular cattle, the sooner the temperature begins and the sooner the maximum is reached.

Averaged Sized Sows are the Best Breeders.

"It is not a day too early now to select the prospective brood sows for next season," says W. J. Carmichael of the University of Inninois. "Some day when you can take the time, get the gilts together, decide how many you will want for the breeding herd and sort them out, taking great care to get only those which have good quality, plenty of stretch, long, strong back, good feet that stand up well on the toes with the toes together and with as much uniformity as possible. In making these selections don't lose sight of the pigs from those sows which are regularly good producers, and on the other hand do not forget to discard the pigs of sows or strains which have shown themselves to be unprofitable. Of course succeeding generations do not always perform in a manner identical or even similar to the preceding, but as a general rule there is a tendency towards a resemblance of record performances.

"Another place where many make a mistake in the selection of breeding stock is in choosing those animals which possess the most size regardless of quality or conformation. It is frequently the case that the larger ones are the most profitable, but year in and year out they are not as profitable in the production of market hogs as are the average-sized sows. The average-size sows may not farrow quite as many pigs per litter as those above the average in weight, but they will save a larger per cent. of pigs farrowed, and the offspring will almost invariably be more uniform."

Work and Exercise for the Bull.

Bulls are powerfully built. Under natural conditions they used their great strength in the fields, grazing, fighting and defending the herd. If tihs great strength is not put to use, it is little wonder that bulls become sullen, or nervous, or phlegmatic, and fail to be sure breeders after two or three years' confinement in a bull pen, writes J. A. McLean in the "Breeders' Gazette."

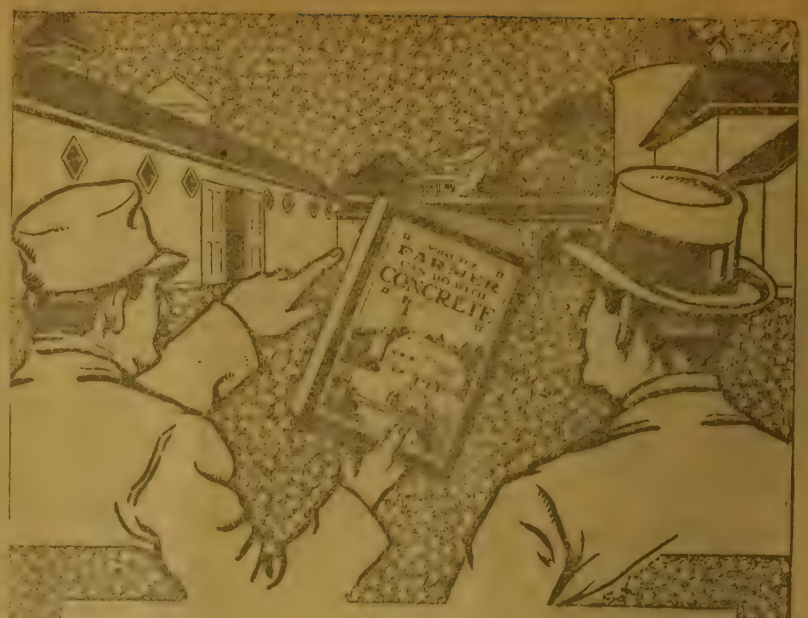
At the Massachusetts Agricultural College we have been working our bulls regularly during the last two years. We have worked a son of King of the May yoked with a son of Interested Prince to the advantage of both of those royal families. Yoked in front of a pair of oxen they have pulled the double-dics harrow, and plowed, and have done their turn at all phases of farm work. Our Holstein and Ayrshire bulls, which are older, have plowed from an acre to an acre and a half daily. They are excellent at hauling manure. We prefer them to horses for work on rough land. One man readily handles either two or four. They get plenty of exercise, which has kept them in fine condition. They have done useful work economically; they are all sure breeders; they are gentle and safe and easy to handle, and we have not yet had to construct large expensively fenced bull paddocks, which at their best are not entirely serviceable. These bulls were broken to the yoke before they were two years old, and gave very little trouble in schooling. If they are allowed a period of idleness they become rather restive and display a desire to be out and at work. Surely there is a merit in the earlier practice of working bulls in the yoke which is worth consideration and emulation.

It may be added that this practice is adopted in various parts of the European Continent. In Sweden the bull is housed in a box in the large shed in which the cattle are kept, and he is said to be much more tractable than the animal kept shut up alone; he is put to useful work, and at agricultural shows is ridden into the ring.

Tapeworm Seldom Cause of Lamb Losses.

The common tapeworm of lambs is one that has a habit of getting into the duct leading from the liver, and for this reason many who have examined sheep, dead of disease, have suspected the tapeworm of causing the death. It might be well to state that more than 60 per cent of all Western lambs have these tapeworms, as is evidenced by finding them on the killing floors at the large packing houses. While it must be admitted that in a few instances they may cause some trouble, yet it is not believed that they are responsible for many of our lamb losses.

During the siege of the Kansas horse disease, some man unfamiliar with the normal condition in horses, for the first time found Palisade worms in the abdominal arteries of dead horses. He at once jumped at



This Book Helped Me Improve My Farm

It is the most valuable book I own and it cost me nothing.

It has saved me time, labor and money and I've got better looking, more durable and more serviceable buildings than I ever had before.

The *first cost* of concrete farm improvements is also the *last cost.* There's no after expense for paint or repairs—no danger from fire, rot or rust—no trouble of any kind. Besides concrete lowers the insurance rate.

If you haven't a copy of "What the Farmer can do with Concrete", send for one to-day. There's more than 150 pages of valuable building information, 52 practical plans, illustrated by diagrams and photographs, and dozens of other interesting farm facts.

A copy will be sent to you free of charge, immediately upon receipt of coupon below.

the conclusion that these worms were responsible for the disease. Had he known that approximately ninety-five per cent of all horses have these same worms, his reputation might not have suffered.

It is rather common for veterinarians to diagnose tapeworms in dogs, and in about 95 per cent of these diagnoses are correct, but that the tapeworms in these animals are responsible for disease is not at all evident, except in a very small percentage of cases. So it is with these tapeworms in lambs. They can always be found in posting any large number of animals, but that they are responsible for any serious disease is evident only in a few cases.—I. E. Newsom, Colorado Agricultural College, Fort Collins, Colorado.

PILES CURED at HOME by NEW Absorption Method.

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money but tell others of this offer. Write today to Mrs. M. Summers, Box P. 309 Windsor, Ont.

Sterility in Cows.

Cystic degeneration of the ovaries is one of the commonest causes of sterility (failure to breed) in cattle. No cure for it has been discovered up to this time, except a form of surgical interference, which has been reported from Switzerland as successful in a percentage of cases when applied by a skilled veterinarian. This is, however, not a practical treatment for the ordinary farmer. According to the teachings of extensive statistics, cystic degeneration occurs most frequently in highly bred, early maturing, valuable breeding and milch cows of from five to eight years of age, and in well-kept heifers of one and a half to three years. However, ovarian cysts in young calves and in aged animals are not at all rare. In regions with very intensively forced cattle breeding and dairying, where large quantities of artificial foods are employed, and where pedigreed breeding animals are overfed, especially on rye, distillers' grains and malt, and in addition are constantly stabled, the disease is indiginous, while in animals more naturally and moderately fed and kept much at pasture, the disease is far more rare.

Cross-Breeding Dairy Cows.

Several years ago some milk producers, against advice from various quarters, started in to cross-breed dairy cows, say the "New York Farmer." With most of them the aim was to produce "cows able to give Holstein quantity with Jersey quality." Their idea of "quality" was confined to the butter-fat percentage in the milk. Reports of their work are coming in now. The results are exactly what any well-informed breeder would expect. The crosses are mongrels. The cows are larger than Jerseys but smaller than Holstein-Friesians. Some of them give a little more milk than the Jerseys in their ancestral lines, but none of them give so much milk as their Holstein-Friesian ancestors gave. Some of them put a little more butter-fat into their small yield of milk than their Holstein-Friesian ancestors put into their larger yield, and none of them equal their Jersey ancestors in butter-fat percentage. In short, these cases of cross-breeding pure-bred animals have resulted in the production of animals that are failures. They are worthless at the pail. They are dubious as breeders. They combine more of the defects and the weaknesses of their ancestors than they show of their merits and their best traits. The moral is that cross-breeding is a mistake for the farmer. No breed of cows is likely to be produced that will "combine all the merits of all the milk breeds." The crossing of breeds is the work of experts, of scientists, of students, not the work of average practical farmers on average farms. Each dairy breed is a distinct entity with peculiar merits. Crossing one breed with another simply breaks down a definite union and sets its elements free to form new combinations, and in the nature of things the new combinations cannot be superior to the old combinations. Farmers cannot hope to accomplish great or even good things by throwing pure-bred cattle, horses, sheep, swine and poultry over into mongrelism.

Don't use Broomstick if Animal Chokes.

Of all animals on the farm, cattle are perhaps the most liable to become choked. Choking is most liable to result from attempting to swallow without mastication, carrots, turnips, potatoes, apples or sugar beets. Cattle frequently choke from chewing leather, boot heels, old rags, and all sorts of unseemly things which could not be digested if swallowed, and indicates a depraved appetite.

In such cases if the services of a veterinarian can not be secured the owner will have to do the best he can alone and the things that are usually done first should not be done at all. Attempting to pour water down the throat usually results in most of it going into the lungs and the result is death of the animal, that might otherwise have been saved.

A case of turnip choke came under observation recently. A sharp pointed broomstick was thrust down into the throat in an effort to push the turnip downward and the animal died from the injury. Less heroic efforts will usually relieve the animal. Whatever is attempted to relieve the suffering animal do not try the drench or the broom-handle.—H. S. Eakins, Colorado Agricultural College, Fort Collins, Colorado.

Alpha Gas Engines
Do Any Work---Use All Oil Fuels

An engine that will do the work you want it to do; that will operate without being continually adjusted and tinkered with; that will burn any fuel you wish, is one of the greatest conveniences you can have on your farm.

Alpha Gasoline engines ure up to these requirements in every respect. You can always rely on them. They start and run on a simple, low-speed magneto. There are no troublesome batteries to watch or fuss with, or wear out and frequently require renewing. Simply turn on the fuel, give the flywheel a turn, and the engine is good for a steady all-day run at any kind of work.

trouble, you field work that your attention.

with the ba roughness o tation. Pre than cure. but Dr. Ch soft and smo you mention Bates & Co.,

THE HORSE

The Poorly-Fed Colt at the Shows.

One of the most important facts being brought out at the colt shows is that the majority of colts are not properly fed. In order to obtain the full hereditary possibilities of the colt it must be liberally fed and kept under suitable conditions. I have come to this conclusion after raising colts of my own, judging more than 1,000 horses and colts in the showrings of 1913 and 1914 and studying live stock conditions on several hundred farms in Iowa, Illinois and Indiana.

The horse show affords an excellent opoprtunity for study and comparison. The sucking foal classes are in most cases the largest in numbers, ranging all the way from 10 to 12 to more than 30 in a single class. These spring foals are lined up in the showring usually before they are weaned or at about weaning time. Nearly all of them are still in excellent growing condition and in large classes many of them look as nearly alike to the ringside observer as peas in a pod. One not acquainted with conditions would naturally believe that since the suckling foal classes contain such large numbers the yearling classes of the year following would be nearly as large. Such is seldom the case. Often only about one-third, or even less, of the foals shown in the suckling classes are in condition to show as yearlings. At shows where the entries run up to 150 horses and colts it is common to find only from 1 to 5 or 6 colts in the two-year-old draft classes. And in the three-year-old classes the well fed and well kept imported colt generally lands the money. Too many of the yearlings and two-year-old colts are not fully developed for their age because of underfeeding. Their owners know for that reason that they cannot compete in the showring with the colt that has been properly fed. Imported horses are liberally fed and well cared for and they have reached the greatest growth possible for their age. If that were not the case importers would not buy them.

Before weaning foals are usually well nourished by their mothers' milk and some grain and hay or pasture grass. Soon after weaning time fall work begins to crowd the owner and the foal is neglected. My experience in feeding colts for many years on the farm and at experiment stations has convinced me that they must receive grain while they are on pasture in order to develop best. Equal parts of corn and oats make an excellent feed for colts on pasture. Colts of the same size and age may be fed collectively in a long feedbunk such as has been used for feeding cattle during the winter. For winter feeding the following ration will keep them thrifty: 50 per cent corn, 40 per cent oats, 10 per cent bran and equal parts of corn silage, free from mold, and good clover hay or alfalfa hay.

The colts' feet should receive attention. This is important and can seldom be overlooked with impunity in the showring. The expert horse buyer who buys horses for the city market or for shipment to Europe loses no time in turning down one with crooked feet, although the animal may be acceptable in other respects. Colts should have their feet examined every six weeks. While the colt is on pasture the feet often do not wear off sufficiently; the horny portion of the hoof becomes too long, then finally breaks off on one side and throws the slope of the roof out of line with the natural slope of the pastern. A pair of sharp pincers, a rasp and a farrier's knife should be kept on hand to trim colt's feet whenever they need it.

With the same breeding, feeding and care, the American-bred colt will not always be out-classes by the imported colt. This fact is being demonstrated to our satisfaction more and more each year at the large horse shows and state fairs. Just at present the average horse has a very poor market. First-class horses that are of proper size and conformation with plenty of vigor and endurance are in demand. Such horses can be raised by careful attention to good breeding, feeding and care. It always pays to keep the colt growing, for as the colt is so the horse will be.—J. W. Schwab, Indiana Experiment Station.

Wintering Stallions.

Almost every veterinarian who practices in a horseraising region is called upon to assist in getting stallions in fit condition for service in the spring, and most of them know from experience what a difficult job it is. It is the first duty of a veterinarian to prevent disease in animals, and there is no one place where proper care and attention are more useful than in preventing conditions that seriously interfere with the usefulness of draft stallions. The average stallion is neglected through the winter. He forgets what a curry comb and brush look like. He is frequently kept in a shed or given the run of a small paddock that does not permit sufficient exercise. The manure is seldom removed, and as a result many stallions suffer from grease heel or scratches, deformed hoofs, thrush and other conditions that should be prevented. A stallion should have pletny of exercise, clean dry quarters, and, above all, his feet and legs should be given as frequent and careful attention during the winter as they receive in the busy season. During the winter, unless a stallion is working, the hoofs do not wear off as they should; they become too long and are easily broken on irregular, frozen ground, so that it is a practical impossibility to restore them to their proper shape until they grow out.

When stallions are neglected during the winter the owners do not as a rule begin to fit them for spring service soon enough, and in the majority of cases the stallions are not in proper condition to ebgin the season. Unless a stallion is in the best of physical condition to begin the season. Unless on, satisfactory results can not be expected. It is difficult and expensive to try to fit a stallion after the season has opened. The stallion should be in condition all the time, not too fat, his feet and legs should be given careful attention during the winter, when he will need little fitting for the breeding season.—N. S. Mayo, D.V.S., Cook Co., Ill.

The Sires of Winning Clydesdales.

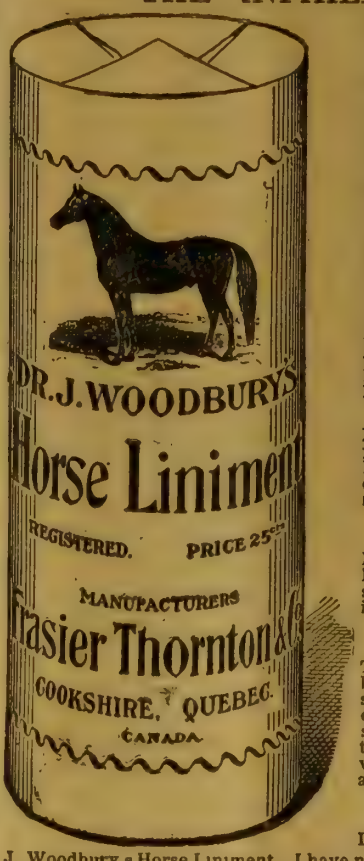
Archibald MacNeilage, secretary of the Clydesdale Horse Society of the United Kingdom of Great Britain and Ireland, has once more compiled his statement on the Clydesdale trade for the year in Scotland. It contains some remarkable facts. But it is only fair to state with as great emphasis as possible that if the Clydesdale has attained to a high rank among the draft horses of the world much of this success must be attributed to the marked attention given to the registration business. Mr. MacNeilage's is a master hand at work of the kind, and no society can excel the Clydesdale in accuracy of detail and immunity from error so far as the records are concerned.

Mr. MacNeilage in passing mentions that three well-known stallions have died during the year—Hiawatha, Sir Hugo and Silver Cup. It is observed that Hiawatha was the opposite of the old style of horse whose merits were summed up in the phrase, "He was a big ane lying doun." A greater contrast could hardly be imagined, according to Mr. MacNeilage, than between the type of Druid, the champion of the Royal Agricultural Society's show at Kilburn in 1879, and Hiawatha, the champion of the Highland and Agricultural Society at Edinburgh in 1899. Yet no one can deny that the Hiawatha type, when matured, is by far the best and most valuable. Animals of this class require time to mature, but when this is accomplished they can be depended upon to last a while.

The show tables are this year curtailed. Two of the most important shows were not held—those of the Giasgow Agricultural Society and of the Highland and Agricultural Society. This of necessity narrows the basis on which Mr. MacNeilage's figures rest, but he does not think that the features of the tables of winning sires would have been seriously altered had they taken place. This year for the first time the show of the Royal Northern Agricultural Society at Aber-

Dr. J. Woodbury's Horse Liniment

THE INFAILLIBLE REMEDY



For the removal of Splints, Bog Spavins, enlargements of any and every description it has no equal. Given internally, it will promptly relieve and remove any and every character of Cough Enlargements of the Glands, Affections of the Kidneys. For distemper, strangles, and colic it is infallibly the remedy All horses that are stabled should have an application of Dr. J. Woodbury's Horse Liniment to the hoofs of the forefeet to prevent their becoming feverish, dry, brittle, hard, contracted or otherwise injured. Insist on having Dr. J. Woodbury's Horse Liniment. We warrant it to effect that for which it is recommended when used according to directions. Its beneficial effects are so prompt and decided that it has excited the admiration of the leading horsemen of the Dominion and secured their highest confidence.

Bear River, N. S.
Dear Sirs:—We do not hesitate in recommending your Dr. Woodbury's Horse Liniment. We have used it in the woods for coughs, colds, distemper and cuts and would say that no lumberman should be without it.
Yours truly, Clarke Bros.

Hubbard's Cove, N. S.
Dear Sirs:—I have used Dr J. Woodbury's Horse Liniment in my stable for years and consider it the best liniment on the market for both internal and external use.
Yours truly, C. C. McLean.

Truro, N. S.
This is to certify that I have used Dr. J. Woodbury's Horse Liniment with the very best results for colds, coughs, distemper and all lung deseases. It is the best to give horses in the spring to keep them in condition. It purifies the blood, cleanses the lungs from impurities which may exist and gives the system healthy action.
Newton Lee, Owner "All Right" 5817.

Elmsdale. N. S.
Dear Sirs:—Kindly send me 6 dozen bottles Dr. J. Woodbury s Horse Liniment. I have not a bottle in the store and it is the only kind my customers will take. Yours truly, Elmsdale Mercantile Co.
Elmsdale, N. S. Dear Sirs:—I cured my horse with Dr. J. Woodbury's Horse Liniment. It was a bad case of distemper. I always recommend this liniment to my friends as the best for all diseases of the horse. Yours truly, H. R. Whitehead.
Dear Sirs:—One of my horses had a bad cough and I made a complete cure with three bottles of Dr. J. Woodbury's Horse Liniment. The cough was of twelve months standing. In my large experience with horses I consider this liniment to be the best made for all diseases in the horse. I recommend it to my friends. E. J. Anderson, Truro, N. S.

deen has been taken into account. The feature of the table undoubtedly is the surprising success of Dunure Footprint as a sire. The results in his case overshadow all the rest, and place him an easy first among Clydesdale sires of today.

In all there were exhibited at the leading shows 34 animals whose sire was Dunure Footprint, and they secured no less than 72 prizes, of which 18 were firsts, 16 seconds and 8 were thirds. Championships were gained by four of his get—the two-year-old colt Kismet, the two-year-old filly Rosalind, Balcairn Primrose and Black Print. All but the first were junior championships.

The sire of Dunure Footprint, the famous Baron o' Buchlyvie, comes second on the list with a very good record of 37 prizes won by 21 animals. Eleven of these prizes were firsts, 10 were seconds, and 7 were thirds. Two championships were also secured—by Dunure Kaleidoscope, a splendid two-year-old colt at the Royal, and by the mare Dunure Chosen, full-sister to Dunure Footprint at Kilmarnock.

Apukwa, owned by James Gray, Birkenwood, Gargunnock, comes third. He has the same total as Baron o' Buchlyvie, but his exhibits only numbered 11, and they had among them 7 firsts, 6 seconds, and 7 thirds. The phenomenal feature of Apukwa's record is his championships. The produce of this horse won all the greatest trophies. Drumcross Radient, a three-year-old colt, won both the Cawdor cup and the Brydon shield at the Scottish Stallion Show. Lady Betty, a great three-year-old filly by him, gained the Cawdor cup for females at the Edinburgh show, the female championship at the Royal, and the President's medal at Edinbugrh; the two-year-old colt Dunure Birkenwood won the male championship at Kilmarnock. This record for championships was probably never equaled.

Bonnie Buchlyvie, the horse for which James Kilpatrick, Craigie Mains, Kilmarnock, gave $26,250 at the Seaham Harbor sale, stands fourth with a total of 16 prizes won by 8 animals.

Baron's Pride is fifth with a record of 13 prizes won by 7 animals, 2 of them being champions. Next in order comes Everlasting with 8 prizes; Hiawatha, Revelanta, and Royal Favorite with 7 prizes each; Signet with 6 prizes; Perfect Motion with 5 prizes; Scotland Yet and Montrave Mac with 4 prizes each; Dunure Index with 3 prizes; Pride of Blacon, Prince Ossian, Boquhan Chief, Oyama, Sir Rudolph, Auchenflower, Sir Dighton, Baron's Fashion, Sir Hugo, and High Degree with 2 prizes each.

Mr. MacNeilage's tables serve an excellent purpose in arousing an interest in the doings of leading horses of the country. The greatest importance is attached to them wherever Clydesdals are bred.—Alexander Mowat, Scotland, in Breeders' Gazette.

Treating Wounds in Horses.

Some of the things to bear in mind when the horses are injured on barb wire are pointed out by Dr. A. S. Alexander of the university of Wisconsin. "After a barb wire accident, do not apply axle grease or any rancid ointment to the wound,' 'says Dr. Alexander. "Wash the wound thoroughly with warm water. Then clip the hair as closely as possible around it, and wash again to remove any hair or other foreign substance. When sand or hair has lodged in the depths of a deep cut, never use a wet sponge to clean it out. Use a piece of absorbent cotton or cotton batting. There will be much less risk of infection.

"It will be useless to put stitches in a wound that is very deep or ragged, or that is located in a place not in perfect rest when the animal is making natural movements. Dry dusting powder has a healing effect on barb cuts and abrasions. Such a powder may be prepared cheaply by mixing together equal parts of slaked lime, sulphur and charcoal.

"Prevent lockjaw danger in nail wounds of the hoof by opening them up freely, which provides drainage for serum and pus. Saturate with a solution of corrosive sublimate, and water in the proportion of 1 to 500. Cover with dusting powder, absorbent cotton and a bandage. This treatment should be repeated daily until the wound is healed."

McCormick

The Lily Bowl Gets the Cream

CREAM is worth too much to waste, yet it is being wasted by the ton every day by old-fashioned methods of skimming. Today there is no excuse for such waste. The Lily bowl gets all the cream it is possible to get, leaving only a drop or so to the gallon of skimmed milk.

Let's take a close look at this wonderful bowl. It is compact and convenient to handle. It lifts off the spindle, leaving the spindle in the separator where it belongs. It comes apart easily, but it can't leak. The disks provide a greater skimming surface than is found in other bowls. Combined with them are six cream gatherers—just twice the number other separators have. Separation begins the instant the milk enters the bowl, and there is always a clear passageway for the cream.

There is not even a cream regulating screw in the cream passageway. You make your cream thicker or thinner by regulating the amount of milk mixed with it, but thick or thin, you get all the cream when you use a Lily cream separator.

The bowl is not the only good Lily feature. The McCormick local agent, who sells Lily cream separators, will show you how every other feature is worked out just as carefully. See him or write us at the nearest branch house.

Whip May Spoil Colt.

Whipping a colt will not break him of rearing up and falling over backwards. It may so fix the habit that a good horse will be ruined. This habit generally begins on account of a sore mouth or rough handling and jerking.

Handle the colt carefully and kindly. Use an easy bit, a big, straight bar bit preferably, if the colt's mouth is tender, and perhaps the habit may gradually be iliminated.

If the colt pulls back on its halter when it is tied up or attempts to rear when tied, be sure to always have a good strong halter rope and tie the animal so securely that he can't get loose nor break the rope. Some horsemen like to hitch the halter rope to a ring two or three feet higher than the horse's head in the barn. It is pretty hard for him to pull back if his head is tied high.

"Metallic" Corrugated Iron Barns are Lightning, Fire, and Weather-Proof

Lumber and labor are too expensive to be used in farm buildings; besides, wood buildings are easily destroyed by fire and lightning. "Metallic" Corrugated Iron makes buildings that last a life-time; that are warm and dry; and proof against fire, lightning and weather.

Costs Less Than Lumber

You save money on labor and lumber when you use "Metallic" Corrugated Iron. Write for complete information before you buy any building material. We can save you money. Our corrugated iron is made in galvanized or painted sheets, straight or curved. 7

POULTRY

Feeds for Poultry.

The crushing or rolling process renders the oats more palatable and more easily digested. In this form they stand in a class by themselves as a grain for laying hens. Oat chop with the hulls sifted out forms the best fattening grain to be obtained. It should form at least two parts of any fattening ration. Pin head or granulated oatmeal is an excellent food for chicks. Oat feed, which is simply hulled oats ground up fine, should be used in any dry mash for chickens. Oats are a bone forming food for young stock. In England oats are the leading grain for poultry which accounts for the heavy bone in all breeds of poultry of English origin.

Barley, though of almost the same composition as oats, cannot be made as palatable nor as digestible by any process of crushing. As a single grain for laying stock it gives but poor results, but if fed in in combination with others it works out all right, although there is always more or less difficulty in getting hens to eat it if they are fed more appetizing grains along with it. Barley chip also works in well as part of a fattening ration. Corn is very rich in fat producing food, but if fed liberally with plenty of exercise it can be fed as a single grain to good advantage for a considerable time. With heavy [illegible] is always inclined to be too [illegible] but if fed [illegible] with wheat [illegible] and oats it helps to [illegible] American poultry producer corn forms the chief [illegible] laying and fattening grain. Cracked corn is excellent as a part of the grain ration for growing chicks. Corn chop works in well as a part of a fattening ration although the yellow varieties always have a tendency to produce a yellow [illegible] The commercial chick foods usually contain about 25 [illegible] Wheat is [illegible] still there are conditions where it would pay the farmer to feed some of it in preference to feeding wheat exclusively or any other grains. After all most of the grains' greatest feeding value lie not only in their own feeding properties, but in the way they mix in with others and their effects on these. Peas and buckwheat both have a tendency towards fattening fowl, [illegible] will work in well with any farm grain to make a laying ration.

Variety is Chief Aim

Variety should be the chief aim in feeding all these grains. The cost will, of course, determine largely what grains you will feed to your poultry. Under farm conditions the usual practice

Exhibition Winnipeg Poultry Halifax, Fredericton, Amherst, 1914. Wolfville Poultry Yards, Wolfville, N.S.

and use screenings for the hens. This practice is all right providing you do not attempt to feed the hens on weed [illegible] combining the various grains or alternating the [illegible] results will always be obtained. Under almost all conditions boiling grains will improve them. This is especially true of barley and to a certain extent of oats, but the time taken to do it is seldom repaid by increased returns. Alternating with boiled grain would probably be the most profitable method to follow.

A poultry ration can be divided into [illegible] the two most commonly fed and the [illegible]

not relished to the same extent as either mangels or cabbage. Lettuce and onions are chiefly used for young stock. Alfalfa and clover if stored for winter use can be fed either in the dry state or cut and scalded and mixed in a mash. For summer they form excellent pasture, but in winter they do not give any succulence. Sprouted oats are probably in a class by themselves as a green food, but under farm conditions it is quite difficult to secure them. A frame set alongside of a furnace would make a good sprouter. The oats should be soaked twenty-four hours and then spread one half to three-quarters of an inch thick on frames having screen bottoms. Keep covered with bags [illegible] Sprinkle with warm water every morning. Sprouters of various sizes may be purchased at a nominal cost, but the history of nearly every sprouter is a few winters' use and then it is set away for good or until the sprouted oat idea strikes you again. The sprouted oats bring the feed as near to summer conditions as is possible with any feed. Rape, lawn clippings and so on might also be used as green food.

The Value of Buttermilk

In the line of animal or meat food we have buttermilk as the best. Its feeding value does not lie in its own food properties only, but in its effects on other food. For young stock it aids digestion, promotes growth, wards off disease and imparts vigor and vitality indirectly. It is worth anywhere from five to fifteen cents a gallon as a food for growing chicks. For laying hens it also has its place.

Edwardsburg
"Crown Brand"
Corn Syrup
POUR IT ON PORRIDGE
YOU can't imagine how delicious a dish of Oatmeal Porridge becomes when it is sweetened with "Crown Brand" Corn Syrup.
Have it for breakfast to-morrow — watch the kiddies' eyes sparkle with the first spoonful — see how they come for 'more'.
Much cheaper than cream and sugar — better for the children, too.
Spread the Bread with "Crown Brand" — serve it on Pancakes and Hot Biscuits, on Blanc Mange and Baked Apples — use it for Candy-Making.
"Crown Brand" Corn Syrup is more delicate in flavor than "Crown Brand". You may prefer it.

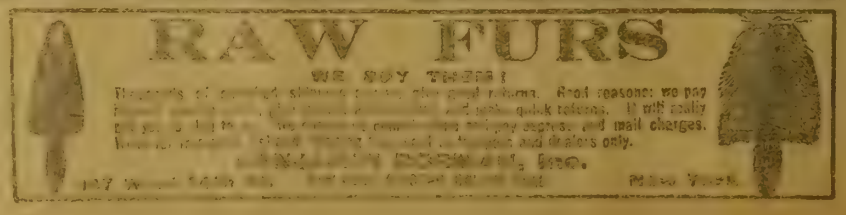
PLAYTIME

MADE IN CANADA



It stimulates egg production and wards off disease. In one experiment last winter it was worth $37.50 a ton as an egg producing food from November 15 to March 15. Skim milk is about the same in feeding value, especially after it has soured. Milk aids digestion. Cut green bone is a very good egg producing food, but it must be fed in limited quantities. Its cost compared with its real value is too high to use when buttermilk and other milk is available. The old idea which is prevalent to a certain extent yet was that in order to get winter eggs you must have a bone cutter to cut bones for your hens. "Increase your egg yield," "Double your profits," "Pay for a bone cutter" and various other "ads." led you to buy a bone cutter only to find that they were extremely hard to operate and you got but fed more eggs and in the end the bone cutter was stowed away as a poor paying investment with the rest of your discarded tools. Green bone costs about three cents a pound. It contains a large per cent of muscle and egg forming food and also quite a lot of lime in the bone. It is hard to keep it unless it is frozen and therefore it is necessary to cut it as you need it. Beef scrap is another of the commercial forms of meat food. It is the offal from slaughter houses, boiled, baked, dried, ground up fine with a preservative added. A large per cent. of this is dried blood. Hoof and horn have but little feeding value and therefore the freer of this the better the quality of the beef scrap. The price of it is usually about four cents a pound. It mixes well with dry mashes for growing and laying stock or can also be used in wet mashes. It is the most convenient form of meat food that can be purchased. It will keep indefinitely and is always ready for use. The offal from butchering is usually the only special meat food fed on the farm and is porbably the cheapest too, but usually the supply lasts only a short time and as a result it has but little effect on the egg production. It cannot be used at all in the summer when you need meat food the most for growing chicks. They absolutely must have some form of meat food if they are to develop and do their best.

In the way of mineral matter we have oyster shell and grit. The former furnishes the lime required to manufacture the egg shell and the latter furnishes grinding material to enable the hen to digest her food thoroughly. Old mortar or pounded crockery will take the place of the former, and coarse sand or fine gravel will answer for the latter. Grit only is necessary for young or growing stock, but both are necessary for laying stock. Mushy, mouldy or sour food of any kind should not be used. Digestive disorders usually follow the use of such foods.

Charcoal keeps the Laying Birds In good Condition.

No farmer should attempt to keep poultry without feeding charcoal regularly. Charcoal can be made on the place at the expense of very little time, and is as important for the welfare of poultry as are grit or oyster shell.

My method of burning charcoal is as follows: A pit about four feet square and about eight inches deep is dug. Of course, the pit can be made as large as one desires. In the bottom of the pit, light brush, cornstalks or anything that will make a quick fire, is placed and on top of this heavier brush or dry fire wood. The pile is topped with several layers of green wood, cut into lengths of two or three feet. When the pile is compactly and neatly arranged, pieces of old sheet iron roofing are placed on top and covered with dirt.

The brush at the bottom of the pit is then lighted in several places and allowed to burn freely until the mass seems to be well ablaze. When burning well, dirt should be gradually banked around the edges, shutting off most of the air. A few small openings should be left for the entrance of air and the escape of smoke. When the mass is throwing off dense clouds of smoke without any blaze showing the wood is charring properly, but where the smoke is light in color, it is an indication that the mass inside is blazing and more of the air should be shut off. Care should be exercised that too much of the air is not shut off for the fire will go out. The mass should be kept smoking freely.

Charcoal is a blood purifier and corrects the evil of overfeeding and injudicious feeding. It is a good remedy for bowel trouble. It is perfectly safe to keep charcoal before the fowls all the time. As charcoal has great absorbent powers for gases, it should be kept in covered vessels, and only sufficient for one day's feeding should be kept in the hoppers. If the hoppers are filled, the charcoal not immediately consumed will soon become impregnated with the foul odors of the poultry-house and will be unfit and unsafe for use. When charcoal is kept in open vessels, it should be heated before giving to the fowls. Heating drives off the impurities and makes it as good as when fresh.—A.

You Can't Make BEAVER FLOUR *Bread* with a western wheat Flour,

YOU can't get the delicious, nutty, homemade flavor, with western wheat flour, that you get with "Beaver" Flour.

You can't get the lightness—the snowy whiteness—the fine texture—the uniform, dependable quality and strength—with western wheat flour that you get with "Beaver" Flour.

The Agricultural Colleges have proved—by experiments — that a true blended flour like "Beaver" Flour, is the only one suitable for both Bread and Pastry.

The bakers, in the big cities like Toronto, have proved that it pays to use a blended flour like "Beaver", because all their customers want "that delicious Bread with the tasty, homemade flavor".

Try "Beaver" Flour yourself. Test it for Bread and for Pastry—and you'll see that it IS BEST for both. Your grocer has it.

One Man With A **Kirstin** Stump Puller

Saves the Expense of Two Men and Two Horses

Clear your land the Kirstin Way—the simple, easy, practical, *economical* way. You don't need a stump pulling crew. One man *alone* handles and operates the Kirstin with ease. Why buy a big, costly, cumbersome outfit that requires several men and a team or two, when you can clear your land at far lower cost with a Kirstin? Prove our claims for the Kirstin by a

10-DAY TRY-OUT ON YOUR FARM

At many land clearing contests the Kirstin has *proved* its superiority. After a competitive demonstration, the University of Minnesota bought a Kirstin for their own use. Facts speak louder than words. The U.S. Gov't. has purchased a number of Kirstins after hard and thorough try-outs. Why? Because the Kirstin is lower in first cost and lower in cost of operation. It can be used anywhere—hills, swamps, rough ground, thick timber—many places where no other puller could be used. The Kirstin is lighter in weight, stronger, has more power, greater speed than other stump pullers, yet is covered by a stronger guarantee.

Write Today for the Big, New Kirstin Catalog

which explains all about the *Improved Dennis Leverage Kirstin One-Man Stump Puller*, tells best way to clear land, describes Kirstin Service, Time Payments, etc. Get this book *before* you buy a stump puller. Write today—now. *Agents Wanted.*

Where the White Nun Walks.

(By E. Everett-Green.)

It was the tradition at Whiteladies that not only all the daughters but that all the granddaughters should be married from there.

It was a pretty family custom, which must have entailed a good deal of trouble and cost upon our delightful, picturesque, white-headed grandparents whom we all adored; but it was the tradition of the house, passed down from generation to generation, and the family gatherings, which became frequent as we girls of the rising generation grew up and were asked in marriage, were a source of gerat happiness to those who took part in them; and a family wedding was a more intimate and interesting event in our family, by consequence, than it generally is in these hurry-scurrying days of the twentieth century.

Somehow when you reached the long beech avenue which led up to Whiteladies, and passed through the wrought iron gates, set in the high stone wall which encircled the house and gardens and a portion of the park, you seemed to leave the twentieth century behind, and almost expected to see cavaliers with love-locks promenading the green glades and wide stone terraces, with graceful stately ladies on their arms—powder on their hair, patches on their faces, their hooped petticoats and trailing brocades making patches of vivid color against the old tsone walls.

The house was all mullioned windows, oriels and unexpected corners and angles. It was very big, covered much ground, yet never overwhelmed you by its size and grandeur. It was like the grandparents themselves—beautiful, stately, mellow, benignant. There was a hush about it which awoke to sweet sounds—the laughter of happy children, the gay calls of girlish voices, the beat of flying feet to the dances in the long ball-room, the lilt of music awakened not by hired professionals but by the skilled fingers of the daughters of the house or their children.

The blare of the motor horn was seldom heard here. The reek of its breath seemed desecration to the sweet fragrance which hung over Whiteladies.

"Isn't it delicious to be here again?" cried one to the other, as we danced up and down the long corridors and ran to grandmother with a hundred little confidences and a thousand trivial questions, always welcomed, always kindly considered. Grandmother was one of those beautiful persons who was never in a hurry, who always laid down her book or her pen to give you her full attention, who always listened to what you had to say. Her manners were as lovely as her beautiful white hair. Both seem going out of fashion now—replaced by transformations and "snap."

It was Esther who was to be married this time, and she had asked me to be one of the bridesmaids, and I had promised I would, though now I was getting well chaffed for it.

"Three times a bridesmaid, never a bride!" they chanted in my ears; but I did not care. Esther was my favorite cousin, and she was going away to a brilliant life led in foreign courts, and everybody said that her husband would be an ambasador in time. She was making a rather brillian marriage, and we were all proud of her and her prospective future. Eustace Barrington was very delightful to us all, and his proesents for the bridesmaids were lovely. It was going to be a charming wedding. There were to be eight of us girl cousins as bridesmaids, and six little pages in white satin—perfect little ducks they looked; and two tiny toddlers of girls, dressed as the mites were in the days of the Stuarts. You wanted to pick them up and kiss them, they were so bonny!

Then the dressmakers had all been true to time, and nobody was worried or flurried; and the only person yet to arrive was a certain "Tony Talbot," who was to be the best man to Eustace on the eventful day. He had some engagements to keep which would prevent his coming till just the eve of the day; and he was to bring with him a case of family jewels, which were being re-set for Esther, but which Eustace particularly wanted her to have to take away with her on departure.

When the weddings at Whiteladies took place, the dower-house in the park was allotted to the bridegroom and his immediate supporters. Practically they belonged to the house party, but the convention of their occupying a different abode was thus observed.

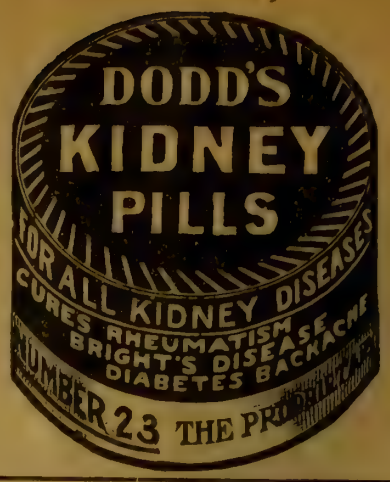
And now the eve of the wedding-day had come. We had decorated the church, we had made the bride's bouquet and our own with the help of the head gardener. Bought flowers were taboo at Whiteladies, and how much more fragrant and delicious were the graceful nosegays made and designed by loving hands, and interwoven, as it were, by fond wishes and bright hopes! The house was full from end to end, the echoes seemed all awake and astir. It had been hard to get the children to bed. Yet there was no confusion or undue hurry perceptible. Dinner was served with all the quiet, simple ceremony which belonged to the house, and at the long table only one empty place indicated the non-arrival of the to-morrow's best man.

"It is all right," Eustace told us. "He may be late; but he will be here. I had a wire at five o'clock. It is the jeweller who has run things a bit close. But Tony will be here some time tonight. You can always trust him when he says a thing. I'm sorry, though, that he could not come before to make your acquaintance. He is a nice fellow. You would have liked him."

It was a warm, still, autumn night when we girls—we bridesmaids—adjourned by common consent out upon one of the terraces, where the fitful moonlight made wavering lights and shadows, and squares of light from open windows lay yellow on the grey flags. We were laughing together over matters past, present and future, when somebody exclaimed:

"Anybody going to look for the White Nun tonight?"

Now there was a legend at Whiteladies concerning a certain long grass-grown walk about a quarter of a mile from the house, and near to the ruined chapel which marked the site of an old monastic foundation. Probably the present house had been built up out of the material of the ancient nunnery which had been swept away by Henry's Cromwell. And, of course, there were traditions of ghostly happenings in and about the place, though these were not very definite or well authenticated. But the traditions of a White Nun, who walked to and fro in the grass-grown avenue beneath the yew



A WOMAN'S MESSAGE TO WOMEN.

If you are troubled with weak, tired feelings, headache, backache, bearing down sensations, bladder weakness, constipation, catarrhal conditions, pain in the sides regularly or irregularly, bloating or unnatural enlargements, sense of falling or misplacement of internal organs, nervousness, desire to cry, palpation, hot flashes, dark rings under the eyes, or a loss of interest in life, I invite you to write and ask for my simple method of home treatment, with ten days' trial entirely free and postpaid, also references to Canadian ladies who gladly tell how they have regained health, strength, and happiness by this method. Write today. Address: Mrs. M. Summers, Box 309, Windsor, Ont.

How to avoid Operations

These Three Women Tell How They Escaped the Dreadful Ordeal of Surgical Operations.

Hospitals are great and necessary institutions, but they should be the last resort for women who suffer with ills peculiar to their sex. Many letters on file in the Pinkham Laboratory at Lynn, Mass., prove that a great number of women after they have been recommended to submit to an operation have been made well by Lydia E. Pinkham's Vegetable Compound. Here are three such letters. All sick women should read them.

Marinette, Wis.—"I went to the doctor and he told me I must have an operation for a female trouble, and I hated to have it done as I had been married only a short time. I would have terrible pains and my hands and feet were cold all the time. I took Lydia E. Pinkham's Vegetable Compound and was cured, and I feel better in every way. I give you permission to publish my name because I am so thankful that I feel well again." —Mrs. Fred Behnke, Marinette, Wis.

Detroit, Mich.—"When I first took Lydia E. Pinkham's Vegetable Compound I was so run down with female troubles that I could not do anything, and our doctor said I would have to undergo an operation. I could hardly walk without help so when I read about the Vegetable Compound and what it had done for others I thought I would try it. I got a bottle of Lydia E. Pinkham's Vegetable Compound and a package of Lydia E. Pinkham's Sanative Wash and used them according to directions. They helped me and today I am able to do all my work and I am well." —Mrs. Thos. Dwyer, 989 Milwaukee Ave., East, Detroit, Mich.

Bellevue, Pa.—"I suffered more than tongue can tell with terrible bearing down pains and inflammation. I tried several doctors and they all told me the same story, that I never could get well without an operation and I just dreaded the thought of that. I also tried a good many other medicines that were recommended to me and none of them helped me until a friend advised me to give Lydia E. Pinkham's Vegetable Compound a trial. The first bottle helped, I kept taking it and now I don't know what it is to be sick any more and I am picking up in weight. I am 20 years old and weigh 145 pounds. It will be the greatest pleasure to me if I can have the opportunity to recommend it to any other suffering woman."—Miss Irene Froelicher, 1923 Manhattan St., North Side, Bellevue, Pa.

If you would like special advice write to Lydia E. Pinkham Med. Co. (confidential), Lynn, Mass. Your letter will be opened, read and answered by a woman and held in strict confidence.

Was All Choked Up

Could Hardly Breathe.

BRONCHITIS

Was The Cause; The Cure Was

DR. WOOD'S Norway Pine Syrup.

Mrs. Garnet Burns, North Augusta, Ont., writes: "I caught a dreadful cold, going to town, and about a week after I became all choked up, and could hardly breathe, and could scarcely sleep at night for coughing. I went to the doctor, and he told me that I was getting bronchitis. My husband went to the druggists, and asked them if they had a cough medicine of any kind that they could recommend. The druggist brought out a bottle of Dr. Wood's Norway Pine Syrup. I started using it, and it completely cured me of my cold. I cannot tell you how thankful I was to get rid of that awful nasty cold. I shall always keep a bottle of Dr. Wood's Norway Pine Syrup on hand, and I shall only be too glad to recommend it to all others."

Dr. Wood's Norway Pine Syrup is a remedy that has been on the market for the past twenty-five years, and we can recommend it, without a doubt, as being the best cure for coughs and colds that you can possibly procure.

There are a lot of imitations on the market, so when you go to your druggist or dealer see that you get "Dr. Wood's;" put up in a yellow wrapper; three pine trees the trade mark; the price, 25c and 50c.

The genuine is manufactured by The T. Milburn Co., Limited, Toronto, Ont.

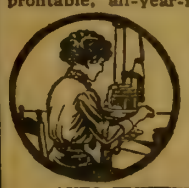
trees, was firmly believed through the country-side; and it was always whispered that the most likely time to see this ghostly visitor was upon the eve of some family "happening"—whether the occasion might be a birth or a death or a marriage.

So it had become amongst the girls of the house something o fa point of honor for one of their number (you must not go in couples—the Nun had never been seen except by a solitary watcher) to go forth alone in the dark to the place where the White Nun walked, and give her a chance of showing herself, and the watcher a chance to cover herself with glory by having seen her.

Truth to tell, these vigils had not been very successful. Once Ada had come tearing back as white as a ghost, declaring that the Nun was sitting on a stone and moaning. But alas!—inquiry and investigation proved the Nun to be nothing more romantic than a dun-colored Jersey cow who had been unwell, and isolated from the herd, had escaped to the grounds and was very sorry for herself on many counts!

Do you want to earn $10 a week or more in your own home?

Reliable persons will be furnished with profitable, all-year-round employment on Auto-Knitting Machines, $10 per week readily earned. We teach you at home, distance is no hindrance. Write for particulars, rates of pay, send 2c. stamp.



AUTO-KNITTER HOSIERY CO.
Dept. 226 257 College St. - Toronto
(Also at Leicester, England)

However, it so happened that Ada married within the year. And Ellen, who went ghostseeking at her marriage, was a bride some fifteen months later. It had been Esther who had gone to look for the Nun last year at Lucinda's wedding, and so tradition was growing that whoever dared make the venture was to win a husband before very long.

"Then Maude shall go!" cried Judith's merry voice. "Look here, you others, it's quite time our dear Maude did something to distinguish herself! And since she's going to dare to be a bridesmaid tomorrow for the third time, it's only right and proper that she should take the antidote as far as is possible and go ghost-hunting tonight. Perhaps the Nun keeps husbands up her wide sleeves, and drops their microbes about broadcast! Anyhow we'll send Maude! I bet she's in a mortal funk! I was going to volunteer for the service, but I'll wait for my chance on the eve of her wedding. Who'll bet that it will be within a year from now?"

There was a great deal of laughing, and I joined in, of course. But, truth to tell, I was in something rather like the 'mortal funk" that Judith had divined. I spent more time at Whiteladies than the others did; for my own parents had died, and though I had a home with Uncle John, I was almost half my time with the grandparents, and was steeped in the lore of Whiteladies, so that I believed a great deal more in the White Nun than did the others.

But there was no getting out of it. I was to go. And all I stipulated for was my long black cloak; for I felt that wrapped up in that I should feel a kind of protection, and might escape observation even from ghostly eyes!

They promised to wait for me, and to come and seek me if I did not get back in half an hour. And disguising my nervous fears under a laughing manner, I waved my hand and ran down the steps, taking the path across the moonlit gardens which lay in the direction of the ruined chapel and the yew walk.

For a few minutes I still heard the sounds of music and voices from the house; but soon these died away, and I was alone in the faint misty light, with only the call of the owls to break the stillness. That is an eerie sound at any time, and now I shivered and drew the folds of my cloak closer round me.

Then the moon went suddenly behind a cloud. All was very dark about me, and just ahead showed the black orifice of the yew walk, where the White Nun was said to move slowly or swiftly up and down.

My heart thumped against my ribs. My task was to walk the length of the avenue and then return. I should be mercilessly chaffed if I turned tail without having performed the allotted task. But I was simply shaking all over with that nameless fear which attacks us at night in lonely places, when everything takes on a new aspect, and you hear stealthy sounds everywhere that send your heart into your mouth.

But with the courage of despiration I plunged into the black tunnel, and at the same moment the moon came out again, or that at intervals it was crossed by bars of ghostly, wavering light.

What was that?

There were sounds—strange sounds—distant, indescribable, confused. I halted, a quarter down the tunnel, holding my breath, trembling in every limb. And next minute I saw it! The white, wavering, ghostly figure—gliding swiftly—oh, very swiftly—towards me.

I would have turned and fled, but my limbs refused to obey. The thing was coming nearer, lost in shadow sometimes, then emerging into the light again. It seemed to me as though I heard hoarse sounds, raucous breathings—and then it fell—it simply toppled over and lay its length in the shaft of moonlight. And at that moment my courage came back in great bounds. For it was not the White Nun at all. It was a man in a light driving coat, and he had fallen like a log, and it seemed to me as though I heard sounds in the distance—voices and steps. And something gave me courage to run out of the deep shadow into which I had slunk and to bend over the fallen man.

"What is the matter? Are you hurt? Can I do anything?"

He did not move or answer at once; but then he seemed to make a great effort. I bent down, for his voice was only a whisper.

"The jewels—for Eustace Barrington—take them. Run to the house with them. They are after me—jewel robbers! I've given them the slip; but they will catch me up. I'm done. But take them. Put your hand in the breast of my coat. You'll feel them!"

I felt something more — something warm oozing over his clothes.

"Oh, you are hurt!" I cried, "I will get help!"

"Take the jewels, I say—and run for your life!" Though his voice was only a whisper it seemed to thunder at me, if you understand. And I heard sounds of pursuit coming nearer. There was no time to get him to the house, to sumon help—to do anything. I had to think in ten seconds what to do.

"Can you move—just a few yards—under that yew tree?"

"Fly—take the jewels—and get to the house!" he panted; but he moved and half sat up. Nearer and nearer came the steps and the muttering voices.

"Into the shadow with you!" I cried, also in a whisper. "Don't you understand?—we cannot get away. In the shadows! Under my cloak. They will pass without seeing us. It is the only chance."

In two seconds we were there—in the hollow of the great yew tree. He on the ground—I was sure he was bleeding terribly—I crouching over him, and the black cloak spread over us both in the deep shadow. We heard the steps coming on—slowly now and cautiously; for the men knew they were in the proximity of some private house. Almost opposite our hiding place they paused in conclave, words of blasphemy and threatening import passing their lips.

Where was their quarry and victim? They were sure they had hit him. They were sure he would eventually drop in his tracks. Where in thunder had he got to? I shook all over lest they should produce a lantern and institute a search. But they did not do so. They pursued their way very coutiously I think as far as the end of the tunnel. From there the lights of the house could be seen, and when they arrived there they gave up the pursuit. I heard the steps returning. I heard them debating should they try

another road? Was there any chance of finding their victim fallen and bleeding in some other spot? Or had he reached safety already?

My heart beat so hard and fast that I could scarcely hear what they were saying. They seemed loath to leave this avenue.

'He bolted down here! I'm sure of it! I don't believe he had strength to reach the end. I know I hit him. I saw him reel as he ran more than once. He's given us the slip; but I'll bet he isn't far away."

"Then let's search! He'll have slipped away into the shadow. Likely he's fainted from the loss of blood. Who's got a light? Let's have a look. Great Blazes—what's that?"

Why we Should Prune and the Different Treatment for Old and Young Trees.

(Continued from Page 252.)

which consists of central leader with branches radiating off from it gives too large and too high a tree for your conditions. It shuts out too much sunlight, thus making the production of clean, well coolred fruit a more difficult task than it should be. Now, there is probably no fruit section under the sun where all the available sunlight possible is needed more than here in these two valleys; furthermore, there are few sections where insect pests and funguous diseases naturally thrive any better than in your climate, so that the first factor in directing the shape of the tree is sanitation, and the central leader type cannot be called a sanitary type of tree. The open centre tree, while possessing admirable sanitary qualities, does not possess the strength of the central leader type, so that a combination of the two is more desirable.

This combination type consists in allowing the central leader to grow for the first year until five or six good branches arranged in a whorl and well spaced can be selected to form the framework of the tree.

By well spacing these scaffold limbs the tree is stronger than if all the limbs should arise from a small area where they would each be pulling against the other and would break down under heavy winds or heavy loads of fruit.

The central leader is not allowed to grow to any great height, so that you have a type with the combined advantages of the pyramidal form and the open centre and with their objections eliminated.

Having decided on the form our tree shall take we are now ready to follow the pruning, year by year. The first year or the fear the tree is set out, it will be necessary to head back all branches in order to give the roots an opportunity to get a hold and to make our trees stocky instead of long and willowy. In recent experiments conducted by the Station at Kentville, trees cut back when planted made a growth of 4.82 inches the first year and 20 inches the second, while trees not headed at all made a growth of 1 inch the first year and only 2.4 inches the second.

Double Hip Braces Lock Each Separate Rafter
Each Separate Rafter Locked at Ridge with Double Steel Braces
Post Braces Set in Snug to Every Post

At Last—A Barn of Definite Strength

AT LAST—a barn that brings you unyielding strength just at the points you need it most. Naturally, you look for strength in steel barn construction. There are other essentials of course. But just as you need four wheels to a cart, so you want ***definite*** strength at every point where strain is greatest.

PEDLAR'S STEEL BRACE "WARDLE PATENT" BARNS

are making history in the Canadian farming world. They have set aside, for all time, the day of heavy wooden beams and posts. They have made unnecessary the loss of space from steel posts jutting far out from the walls, or projecting to the hips. They bring to the farmer of to-day the barn of to-morrow. They bring him ALL the room—ALL the strength—ALL the protection and convenience the science of steel construction has evolved.

PEDLAR'S Steel Brace "Wardle Patent"

See for yourself the clear, open space and greater roominess in all parts of the Pedlar Barn, made possible by Pedlar's Steel Brace "Wardle Patent"—not a new idea, but a brace that has proved its value through the test of ten years' usage. Notice how it sets up close to every post, entirely out of the way.

Double Hip and Ridge Braces Lock Each Separate Rafter

Safety in steel construction rests on a **positive hold** at the ridge and hip. So at these points in the Pedlar Barn you will find a double set of steel braces on each separate rafter. Think of it!—**Each Separate Rafter.** These powerful braces, placed right at the points of strain, mean as much to you as a solid steel beam from wall to ridge—and without excessive cost. No wonder the Pedlar Barn is stronger! No wonder you can expect to find it as firm and rigid fifty years from now as it is to-day!

An Advantage you Have Never Been Offered Before

An advantage found only in Pedlar's Steel Brace "Wardle Patent" Barn is the fact that you can operate your hayfork in the ridge or in either of the hips. An exclusive convenience that points still further to the scientific thoughtfulness called forth in Pedlar construction.

Inherited Security

The same famous "Pedlar" coverings that have provided such protection to the wooden frame barns in the past are now found in Pedlar's Steel Brace "Wardle Patent" Barn. "George" Shingles, in big, generous size, 24 in. x 24 in.; or if prefered, 26 gauge "Perfect" corrugated, galvanized iron roofing is supplied. Once the 28 gauge corrugated iron is placed on the wall frame, not one inch of wood appears from the outside. Pedlar's Steel Brace "Wardle Patent" Barn is absolutely LIGHTNING-PROOF, FIRE-PROOF, RAIN-PROOF, RUST-PROOF, and WIND-PROOF.

Surprises Await You

Once you see Pedlar's Steel Brace "Wardle Patent" Barn, surprises await you at every turn. Roof and gable windows, metal framed and glazed with wired glass, reflect abundance of light to all parts of the barn. Pedlar's "Superior" Barn ventilators supply ample ventilation and are proof against the nuisance of birds. Extra ventilation when threshing is available through the windows, which are made to open and close. Eavetrough, conductor pipe and complete accessories properly drain all water from the roof. Eave and Gable cornices make an airtight covering at these vulnerable points.

Everything Complete

Everything comes to you complete to the smallest detail ready for our expert workmen to set in and erect in a few short days. Wouldn't you like to know more about Pedlar's Steel Brace "Wardle Patent" Barn? Wouldn't you like to see plans and blue prints of just the size of Pedlar Barn best suited to your own farm? We will gladly send you, without obligation whatever, complete plans and working drawings without delay.

WHY MRS. MARCHBANKS USED DODD'S KIDNEY PILLS

She Found Quick Relief and Now Recommends All Women Who Suffered as She Did to Use Dodd's Kidney Pills.

St. Martin's, St. John Co., N.B. Jan. 17th. (Special).—Mrs. Violet Marchbank, wife of a well-known farmer living near here, is telling her neighbors of the splendid results she has got through using Dodd's Kidney Pills.

"My trouble started from a cold," Mrs. Marchbank states. "I had backache, my joints were stiff and my muscles cramped. I was irritable and always thirsty. My appetite was fitful and I felt heavy and sleepy after meals. Rheumatism was added to my troubles as well as headaches, and heart flutterings made me very anxious at times.

"I suffered for about two years and was far from being a well woman when my brother told me what great things Dodd's Kidney Pills had done for him and I made up my mind to try them.

"I sent and got three boxes and they helped me right from the start. I can recommend Dodd's Kidney Pills to all women who suffer as I did."

Every one of Mrs. Marchbank's symptoms was a symptom of kidney trouble. That is why she found such quick relief in Dodd's Kidney Pills.

Sizes for 2, 3 and 4 horses.

(Continued from Page 247)

On rising to address a Nova Scotia audience for the first time, Hon. J. A. Murray, Minister of Agriculture for New Brunswick, was most cordially received. He had not proceeded far until his hearers appreciated that the sister Province, too, had an eloquent Hon. Mr. Murray. He paid a warm tribute to the kindness of his friend Premier Murray of Nova Scotia. He brought felicitations from the people of New Brunswick to the people of Nova Scotia on the advanced step they had taken in agricultural education, and especially with regard to the introduction of a branch of technical learning designed for the women of the farm. He was brilliant in his allusion to the present battle for justice, righteousness and truth being waged in Europe, and congratulated the khaki dressed boys before him on their splendid appearance.

We on this side of the Atlantic had a goodly heritage, one worth fighting for, worth dying for. The question might be asked why were the representatives of the Maritime Provinces gathered here tonight. He said it was the goodly heritage. He often asked himself, can there be in all the wide world a finer country than this? It was to develop this heritage of rich meadows and broad acres, and he would stop here to congratulate Premier Murray on the possession of Principal Cumming and this Agricultural College. In New Brunswick they had agricultural schools, three in number, but they wanted Nova Scotia to have the College. Their schools would fit the student for advanced learning in the college.

In New Brunswick they recognized that the Provinces had one aim—and one Agricultural College was sufficient for all. They had nothing in common greater than that of agriculture. He emphasized that matters of politics did not enter into the discussion. It was a discussion on ways and means for a better condition. He was not discussing Maritime federation, but federation along lines of agriculture, and more progress along this line. Agricultural action would be the watchword, and directing his closing remarks to the chairman, he said: "We propose to assist you along these lines."

Among other speakers was Mayor Stackford, of Truro, who was present with his Town Council. Local talent assisted in making the occasion a happy one with a programme of music, and a generous treat was handed through the audience. Sergt.-Major Ford of the 106th urged enlistment among the younger men. A program of songs and choruses was well received.

Serious Horse Distemper.

Much has been said recently in the local papers regarding the serious epidemic which horses throughout the Maritime Provinces are suffering from at the present time, causing death in almost every instance where it attacks the animal. A recent statement in the papers here stated that veterinarians are unable to either prevent contagion which they think in many instances is carried on the clothes of persons that attend horses, or cure the disease after it once gets established.

It may therefore be of interest to horse owners to know the peculiar fact that English veterinarians not only prevent contagion, but in some cases cure the disease after it is established by the use of LUMP ROCK SALT. Every horse that has been taken overseas from Canada has been provided with a lump of English Rock Salt, and the report is that the horses arrive in most excellent condition. Also, upon enquiry amongst the horsemen in general in this city, it has been found that those who provided their horses with lump salt have escaped the epidemic entirely, while teamsters in this section have been known to lose as much as $900.00 worth of horse flesh in three years' time, which possibly could have been entirely prevented if a few cents had been used for the purchase of this very necessary food.

Every one knows that salt is a very cheap article and there is no excuse for parties not being supplied with it, the price being only: 1c per lb. It can be had in assorted size lumps from Gandy & Allison, 3 and 4 North Wharf, St. John, N.B.

Dont' apply manure heavily. It is better to treat the land lightly and otfener.

If you wish to purchase Fencing and Gates to advantage and save dollars this is the time to do it.

Wire is steadily advancing in price, far beyond the advance in Fencing, and Wire Fencing must advance very soon to correspond with the advance in wire. "ORDER NOW."

Purchase the Maritime Woven Wire Fencing and Gates, the best the market affords. Maritime Fencing is guaranteed.

suitable grinding. It it contains any considerable amount of bone, it must be designated digester meat and bone tankage.

Distillers' dried grains are the dried residue from cereals obtained in the manufacture of alcohol and distilled liquors. The product shall bear the designation indicating the cereals of which these grains are composed.

Brewers' dried grains are the properly dried residue from cereals obtained in the manufacture of beer.

Malt sprouts are the sprouts of the barley grain. If the sprouts are derived from any other malted cereal, the source must be designated.

Alfalfa meal is the entire alfalfa hay, ground, and does not contain an admixture of ground alfalfa straw or other foreign materials.

Chop is a ground or chop feed composed of one or more different cereals or by-products thereof. If it bears a name descriptive of the kind of cereals it must be made exclusively of the entire grains of those cereals.

Screenings are the smaller imperfect grains, weed seeds and other foreign material separated in cleaning the grain.

Shipment of Potatoes to United States.

On and after the 1st January, 1916, potatoes may be shipped from Canada to the United States, subject to the following conditions:—

(1) Potatoes offered for export to the United States must be free from injurious diseases and insect pests.

("Injurious diseases and insect pests" shall not apply to diseases common and wide-spread in both Canada and the United States, but in the case of even such common and wide-spread diseases the stock offered for shipment shall be reasonably free from infection with such diseases.)

(2) No shipment may be made until a permit has been issued to the United States importer as provided for in the United States regulations. Each shipment should therefore be designated on the accompanying papers by the permit number which will be furnished by the United States importer.

Inspection will be made by a United States Inspector at the port of entry specified in the permit, and if the shipment be found to be diseases, entry may be refused.

(3) No inspection or certificates will be required prior to shipment, but potato growers and shippers are advised that the continuation of such entry will depend on the offering for entry into the United States of potatoes free from dangerous diseases and insect pests.

All persons engaged in this trade should have their potatoes carefully "racked," and any diseased or scabby potatoes removed.

For further information, apply to the Dominion Botanist, Central Experimental Farm, Ottawa.

Published by the direction of the Honorable Martin Burrell, Minister of Agriculture, Ottawa, December 27th, 1915.

Ventilation and Fresh Air.

Supplying of Pure Air to Homes in Winter of Utmost Importance

Live night and day as far as possible in the fresh air.

With the advent of the winter season, and consequent lower temperatures, comes the usual sealing up process in the homes. A supply of fresh air becomes secondary in importance to the exclusion of the colder atmosphere. The consequence is insufficient pure air to properly sustain life at its best.

The open air is the greatest disease preventing and disease-curing agency

Your Kidneys

may cause DROPSY, RHEUMATISM, BACKACHE or GENERAL WEAKNESS.

Dr. Cassell's Tablets are the Proved Remedy. Take them for all Kidney & Urinary Troubles.

In these trying complaints Dr. Cassell's Tablets are of proved value. They restore perfect efficiency to the kidneys by nourishing the nerves which control kidney action, and thus enable the system to get rid of uric acid and other impurities which are the cause of Urinary Troubles, Dropsy, and Rheumatism.

Dr. Chas. Forshaw, D.Sc., F.C.S., etc., the well-known scientist, says: "I have thoroughly tested Dr. Cassell's Tablets, and can conscientiously recommend them as an eminently safe and effective remedy for all forms of nerve and bodily weakness. My knowledge of Dr. Cassell's Tablets leads me to the opinion that the ingredients form a remarkably potent medicine, quite safe for young and old in cases of nervous prostration, debility, anæmia, loss of flesh, malnutrition, children's weakness, spinal and nerve paralysis, and many forms of stomach and kidney troubles."

Dr. Cassell's Tablets raise the vital standard of the entire system, and thus promote kidney health and general health when other means fail.

Dr. Cassell's Tablets are Nutritive, Restorative, Alterative, and Anti-Spasmodic, and of great Therapeutic value in all derangements of the Nerve and Functional Systems in old or young. They are the recognised home remedy for Nervous Breakdown, Nerve and Spinal Paralysis, Infantile Paralysis, Rickets, St. Vitus' Dance, Anæmia, Sleeplessness, Kidney Disease, Dyspepsia, Stomach Catarrh, Brain Fag, Headache, Palpitation, Wasting Diseases, Vital Exhaustion, Loss of Flesh, and Premature Decay. Specially valuable for Nursing Mothers and during the Critical Periods of Life.

Druggists and Dealers throughout Canada sell Dr. Cassell's Tablets. If not procurable in your city send to the sole agents, Harold F. Ritchie & Co., Ltd., 10, McCaul Street, Toronto; one tube 50 cents, six tubes for the price of five.

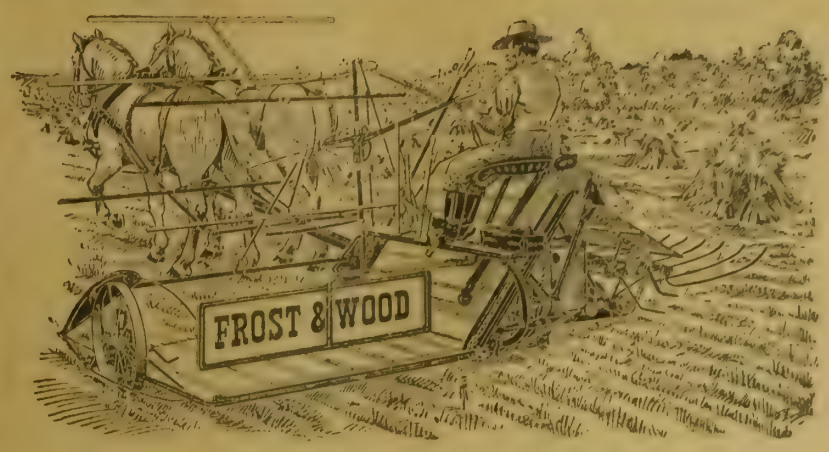
in existence. The air we inhale daily is by weight twice as heavy as the food and drink we swallow. A man may live for weeks without food, for days without drink, but only a few minutes without air. Much greater care should therefore be taken to supply to our homes, places of business, schools and public halls a sufficient amount of pure air.

Authorities agree that each adult requires 3,000 cubic feet of air per hour. On this basis the total air content of a room 10 x 10x 10 should be renewed three times every hour. The secret of good ventilation is to renew the air in a room at least thus often, day and night, without creating a draught. Owing to this danger it is necessary that the foul air be removed and fresh air admitted to inhabited rooms at such places as will not give rise to draughts. The simplest method of natural ventilation is that of more or less open doors or windows. As the most impure air in a room is at the ceiling, and the freshest at the floor, windows should be made to open from the top.

Winter and summer the bedroom window should never be closed when the room is occupied, except during very damp or foggy weather. Sleeping in cold air is not at all dangerous, if one is properly clad, although it may be so if protection be insufficient, and especially if the cold air plays upon the sleepers' head. The open window is quite as essential to a large bedroom as to a smaller one. It cannot be too often repeated that tuberculosis is not contracted by exposure to cold, as our sanitariums are situated in the coldest and driest climates. Dust and badly ventilated houses and factories are the real cause of this disease. Sir Morell MacKenzie, physician to the late King Edward, said: "The process of re-breathing air that has already been used, if long continued, leads to asphyxia and death. Short of this much so-called 'delicacy,' susceptibility to cold, languor, headache and nervous depression are also due to the same cause."

Canada is fortunately gifted with a bracing and healthy climate, resulting in the developing of a race of sturdy manhood. When pure and fresh air means to much in life, why shut it out rfom our homes, seal ourselves in and re-breathe the air from which we have already extracted and absorbed the life-giving element?

Buy Your Binder RIGHT



The most important implement investment any farmer can make certainly is his Binder, and right there, because thousands of farmers realize that fact---is the reason for the tremendous popularity of the

Frost and Wood Binder

THIS is the Binder noted for its light draft—its sure, speedy cutting—its great strength—its ease of handling. But the greatest of all its assets is Reliability. This comes from long Frost & Wood experience in the development of the Binder. It comes from many stringent tests we give every F. & W. Binder before it goes to the customer. The Frost & Wood Binder has a big power wheel of special design, special roller bearings, special cutter bar, special non-failing knotter, special non-clogging elevator and other exclusive features too numerous to list here. Frost & Wood make the Binder you can buy and KNOW it will give you the field service you want in any emergency.

Roller Bearings, Sure Tying, Easy Levers,
Swift Cutting, Light Draft, No Threshing,
Cuts any Crop, Special Rollers, No Chocking.

Write nearest Branch or Office for Frost & Wood Binder Book and see what a splendid machine it is.

Treatment for Contagious Abortion In Cows.

Enquirer.—"Kindly inform me as to the carbolic acid treatment for contagious abortion among cows; also as to any other treatment recommended."

Answer—The carbolic acid treatment for contagious abortion consists of the daily administration for about two weeks, of one dram doses of the acid. The proportion of salt is immaterial, as the salt acts solely as a vehicle for the acid. It is usually given in the proportion of one dram of carbolic acid to one ounce of salt to each animal. At these doses there is no particular danger from poisoning provided each animal receives not more than the prescribed quantity. With three pounds of carbolic acid mixed with twenty-five pounds of salt, the dose would be one ounce to each animal.

The above treatment for contagious abortion has been extensively tried, but after carefully conducted trials with its use, it is impossible to accord to it any degree of special value.

Methylene blue has recently been introduced as a cure for this disease, and many encouragin reports have been made. The dose of the drug is from one to two teaspoonfuls, mixed with the feed, once a day, for a period of six weeks.

Up to the present the most approved means of dealing with contagious abortion is along the lines of disinfection and isolation. Isolate any suspected or aborting animal from pregnant cows and heifers. The stalls, floors and gutters should be thoroughly cleansed and disinfected. All bedding, litter and feed should be removed and burned, also the aborted foetus and its membrances. Cows, after aborting, should have their genital passages washed out at least once a day with a warm antiseptic or carbolic solution, or a corrosive sublimate solution one in three thousand.

All the contact pregnant females should have their hips, tails and external genitals washed thoroughly and often with the creolin solution. After aborting, cattle should be isolated for at least one month and not be permitted to run at pasture with other cattle until all discharges have ceased, as they may remain virulent and be a possible source of infection for several months. The bull, after each service, should have his sheath and penis disinfected with the above disinfectant solution.

Wet and Dry Spraying

Please tell me the advantage or otherwise of dry spraying of potatoes? —S. H.

Ans.—The attraction about dusting is thta it is less troublesome than liquid spraying, there being none of the heavy carting of water and preparation of solutions. All that is necessary is to buy the powder, fill the hopper, of the machine and set it going through the crop. When you have said this, however, you have said all that can be brought forward in favor of dusting. On the other hand, there are many objections. The work can only be done while the potato haulm is wet with de wor rain. Horse-drawn machines for distributing the powder over large areas are considerably more expensive than horse-drawn sprayers for liquids, while knapsack powder machines are short-lived and none too satisfactory in working. Another drawback to dusting is that the powder is more easily driven out of its course by wind than is a liquid spray. But the chief objection to dusting is that it is less effective against the disease than spraying. The Irish Departmetn of Agriculture has made this clear by field trials. Several of the proprietary powders were tried against a 2 per cent. Burgundy mixture (liquid.) The result at nearly every centre was a loss of between 1 and 2 tons per acre in sound potatoes where the crop was dusted instead of sprayed, whilst the proportion of diseased tubers was considerably increased. Altogether you will see that the advantage lies decidedly with liquid spraying.—E. M. B.

Wood-Waste from Saw-Mills as a Source of Potash.

In addition to the potash from hedge clippings and vegetable refuse, etc., the writer draws attention to the value of wood scraps, saw-dust and shavings, produced in enormous quantities in saw-mills. In localities where this wood waste is not saleable for other purposes it may with advantage be converted into ash and used as a potash manure. The flue dust from gas-producing plants may contain as much as 10 per cent of potash, thus possessing the same value as kainit.

Other analyses of the ash gave the following figures:—

	K2O per cent.
1. Coarse ash, combustion very complete	7.24
2. Coarse ash, combustion very complete	5.08
3. Flue dust, combustion very complete.....	9.11
4. Flue dust, combustion very complete	6.35
5. Flue dust, coarser than 3 and 4	5.89
Aferage	6.73

On the basis of the ordinary price of kainit, ashes with the above composition should be worth from $6 to $12 per ton; and since ash is almost purely a waste product there is good reason to suppose that it could compete with kainit even in normal times.

Volume 21. SUSSEX, NEW BRUNSWICK, FEBRUUARY 8, 1916. Number 9.

Twelfth Annual Convention of the N. S. Farmers Association

The twentieth annual convention of the Nova Scotia Farmers' Association held at Windsor on the 25th, 26th and 27th January, while not so great in point of numbers as some of its predecessors, was a good representation of the best farmers of the province. Delegates were present from the best farming sections, from Margaree in the northeast to Yarmouth in the south-west. The work accomplished compared favorably, if it did not excell that done at former conventions.

President A. S. McMillan called the first session to order at 7:30 on Tuesday evening. There was not a single wrangle at any one of the sessions. Parliamentary rules were closely followed and there was no useless waste of time in talking against time. The slate was cleaned off at every session and when the closing hour had arrived the work scheduled on the programme had been completed.

At the opening session, with the president on the platform: Mayor Roach, of Windsor, who gave the delegates a hearty welcome to his town; W. Kerr Dimmock, municipal clerk for West Hants, who welcomed the delegates to his county; Dr. Reid, M.P.P.; Prof. M. Cumming, Prof. Cunningham, and the officers of the Association.

In the absence of the secretary, C. R. B. Bryan, who was called away owing to the illness of his son, R. J. Messenger, first vice-president of the Association, was appointed secretary pro tem.

Messrs. R. J. Messenger and Wm. Murray, the first and second vice-presidents of the Association, replied to the address of welcome.

Several Windsor ladies and gentlemen entertained the convention very pleasantly between addresses with splendidly rendered solos and quartette selections.

The President's Address

To the Officers and Members of The Nova Scotia Farmers' Association:

Gentlemen:

As your President, it is my duty, as well as a great pleasure for me, to welcome you to this Twentieth Annual Convention of the Nova Scotia Farmers' Association, which is being held this year in the historic town—Windsor.

Before taking up the duties that devolve upon us, as members of this Association, we would return thanks to our gracious God for the many blessings we have enjoyed during the past year.

When we last met in annual convention we little thought that at the close of another year's work we would meet again with the dark war clouds still hanging over us; in many of our farm homes there is the vacant chair, and the loved one that could ill be spared gone to serve his King and Country; one of our Directors, elected last year, Rev. Miles Tompkins of Antigonish, is now serving his Country on the other side of the water; another member of this Association, who for a number of years, has been a conspicuous figure on the floors of our conventions, is serving his country at the front; and still the call comes for "more men," and undoubtedly many more of our boys will feel it their duty to answer the "Call," and if necessary, make the supreme sacrifice in defence of those principles for which our Empire stands, which mean so much to free-born Canadians.

The season of 1915 will be notable for the fact that Nova Scotia produced the largest hay crop in her history; all over the province the hay crop was above the average; clover grew in abundance; in fact, the growth of this plant was almost phenomenal; fields on which not a single plant grew in 1914 had an abundant crop. This fact alone, is bound to have a good effect on our field crops for the next year or two.

On the other hand, our grain and root crops were below the average—particularly roots and vegetables. This is also true of the apple crop. The farmer who specialized in any of these crops last year will, undoubtedly, begin this year with a deficit. To my mind, this season demonstrated the fact that mixed farming is the most profitable in this province.

Dairying has during the past year made greater progress than any other branch of farming; in fact, the advances made by this industry during the last few years have been so remarkable that it is hard to realize what has been done. If we continue to advance within the next ten years as far as we did in the last, we will surely become the "Denmark of America."

Now that the dairy industry is on a solid footing, it is in a position to take care of itself, it seems to me fitting that something should be done to stimulate beef raising. We are making no progress along this line; we have, in this province, many districts far removed from lines of railway and steam-boat communication where creameries cannot be profitably operated that are well adapted to beef raising, and if anything further can be done to stimulate or encourage this branch of farming in our outlying districts, I feel sure it would be appreciated. I am well aware that we cannot compete with Ontario and the western provinces in beef raising, but we should surely be able to raise sufficient for "home consumption."

The prices paid for cattle, sheep, lambs and wool, and in fact, all kinds of farm products reached the high water mark during the past year; the only exception being horses; the market for them being very dull—due, no doubt, to the fact that the lumbed operators are doing very little work, and that public works are nearly all closed down.

Our Exhibition at Halifax was, with the possible exception of roots and vegetables, up to the usual standard. The Maritime Winter Fair in many departments was, undoubtedly, the best ever held. Our county exhibitions were also very good—and, judging form the quality of exhibits shown at many of them, marked progress is being made.

Our Agricultural College, under the efficient management of Principal Cummings and his capable staff, is still forging ahead. One of the chief events of the past year being the completion and opening of the new Science Building on the College grounds. It should be a source of gratification to us all that our Federal and Provincial Governments are working hand in hand to promote the interests of the farmer and the erection of this magnificent new building will ever stand as a monument to their co-operation.

Besides the regular short courses held at the College, a number of short courses were held at several centres throughout the province. The attendance at these courses and the interest taken in them, proves the wisdom and fore-sight shown in the establishing of these courses.

I cannot pass on without referring to the work of Miss Fraser, superintendent of Women's Institutes. The success of her work may be judged by the large number of women who attended the short course recently held at Truro. The education of farmers' wives and daughters along this line will do much to improve the "social conditions" in our rural communities. With the education of our sons and daughters will come the realization of the dignity of their calling. This, with the prosperous condition of our farmers, our free rural mail delivery, and our rural telephone service, should do much toward making our farmers a "happy and contented people."

We started out to prepare for "last years' work" with bigger crops for 1915 as our motto; later on, this was supplemented wtih the slogan—Patriotism and Production; to the campaign inaugurated under these mottoes we are indebted for our increased acreage in this province in 1915. Then let us ask ourselves the question: "If Patriotism and Production were a suitable motto for last year, what should our slogan for 1916 be?" It appears to me that we might well adopt as our motto for this year: "More Patriotism and Greater Production." More patriotism because our Empire needs every man who can be spared to enlist for service with King and Country. Greater production because for every extra dollar we succeed in wresting from Mother Earth, our Empire will have one more dollar to spend in bringing the war to a speedy termination, and we will have one more dollar to contribute toward that end.

Let us, therefore, begin this year with optimism born of faith in the justice of our Empire's cause—determined to do everything within our power to assist our Empire in her hour of need; determined to make this year the most successful in the history of our province; determined to raise bigger and better crops this year than ever before; determined to keep ever before us as our motto "More Patriotism and Greater Production"; and we trust and believe that before we meet again in annual convention our Empire will have emerged from the present struggle triumphantly.

Report of Directors, 1915.

Since the Nova Scotia Farmers Association met in convention, one more year has been added to the past and has become a page in history, and in the futuer wil loften be looked back upon as the year in which our Empire's patriotism and strength was brought to the test. Last year our Slogan was Patriotism and Production; Patriotism of this Canada of ours, the other colonies and the Mother Country has been proved and not found wanting; Production has been answered by a record from the farms of Canada, and the farmers of this province showed their worth, they did their bit though the seasons were unfavorable. Our boys have been in the trenches a year and have demonstrated the stuff they are made of, and they are likely to be there for some time and though we have no doubts as to the eventual outcome we must continue sending help and food, and following our calling as producers of food, it becomes our duty ot see that every effort is put forward in that direction. They expect it of us and we must not fail them.

After the close of this meeting, when discussions on the several subjects have taken place and personal conversations on like matters are through, and you return to your farms, it will devolve upon you to see if you cannot do somewhat better than last year, if not, you will make no advance, no advance is really a step backwards, this we know you will not do.

The program consists of subjects your committee think will be well to discuss, and as usual no doubt others will be brought before the meetings and we ask you to give them your best attention.

The question of widening the scope

of Agricultural Societies and County Farmers Associations into co-operative bodies we ask you to thoughtfully consider and also how best to make the County Farmers Associations of more practical benefit.

The Stallion Enrollment and Inspection Act was placed on the statutes of Nova Scotia at your suggestion, but there are weak links in it that need strengthening, and a place is on the program for duscussion upon this question.

The Provincial Exhibition was held at Halifax last year, the gentlemen whom you nominated as your representative upon the Commission will report in a few minutes.

Again we have to congratulate the Maritime Stock Breeders Association upon the successful Horse Show held in April and the Winter Fair held in December. We all know that the population in these Maritime Provinces is too small and scattered to make these financially successful without a grant from the public funds, but the grant is wisely made considering the eduactional feature which permeates through the country, not to say anything of the improvement in stock year by year. We regres that under circumstances necessitated by the war a Horse Show cannot be held this year.

We as an association representing the agricultural interests of this province should record our appreciation of the support given to agriculture by both the Dominion and Provincial Governments, we cannot enumerate them all but the grant of $68,000 under the Dominion Agricultural Instruction Act stands out as one, and under the Provincial Department of Agriculture has been spent with great benefit to the province. The new Science building built by the province at the College at Truro, at a cost of over $100,000 has been completed, was opened by Dr. C. C. James on the 11th inst., and is being used. This will greatly add to the efficiency of that Institution we are all so proud of.

Dairying still continues to forge ahead, the Creamery built at Baddeck by the Provincial Government is proving very successful and it has warranted them building another this past year at Margaree which promises to be just as successful. The Nova Scotia Dairymen's Association formed a year or two ago is doing good work, they held a very successful convention a few weeks' ago and have set out to do still better.

The Provincial Government also made a grant towards encouraging the growing of wheat and cereals, and better facilities for getting it ground for home consumption. A flour and oatmeal mill has been erected in Cape Breton and elsewhere aid given. These are in addition to the annual grant for the encouragement of agriculture.

We must ont forget to congratulate the Women's Institutes of the province which under the directorship of Miss Jennie A. Fraser, are increasing rapidly, upon the work they have done and are doing in these times towards alleviating the sufferings of those at the front, over $7,000 raised by the Women's Institutes in Nova Scotia for Ambulences is one item of their noble work. They held a largely attended convention at Truro a week or two ago.

In conclusion we need not again urge you to continue every effort to do your best to support the Empire in her struggle in championing freedom, we know you will remember that this present year will need more effort than last to supply the food on account of the withdrawal of so many brave tillers of the soil from the soil into the ranks. But this is a fact we would have you all realize and live up to, the call for bigger crops is still the Slogan only more so.

Directors—Walter Churchill, Samuel Freeman, Wallace Rhodenizer, John McQueen.

Exhibition Commissioners' Report

To the Officers and members of the Nova Scotia Farmers' Association, 1916:

Your representative on the board of commisisoners of the Nova Scotia Provincial Exhibition herewith submit for your consideration the following report:

We are pleased to be able to state that notwithstanding several serious disadvantages we have been successful in carrying out an exhibition which in many lines compared very favorably with any held in the past.

Some of these disadvantages might be mentioned here so that you may be in a better position to more fully appreciate the conditions under which we were placed.

The date at which the exhibition is held is having a very marked effect on the horticultural and agricultural departments; and more particularly this year as you all know the season this year was much later for seeding than usual. The advancement of crops show consequently at show time it was difficult to get exhibits up to the state of maturity required to make a first class showing. However, we are pleased to find that the exhibitors met the situation and to a wonderful degree overcame the obstacles in the way and the result was most satisfactory. (We are not putting this forward as a criticism of the date as this is an open question and considering the exhibition in all its aspects, we could hardly say whether or not a later date would be any advantage.)

We would also mention another disadvantage in the opposition of the City of Halifax as represented by their Board of Trade and Board of Controllers as well as the city commissioners to the holding of an exhibition at all. This opopsition assumed considerable proportions and required a corresponding amount of attention on the part of the commissioners from outside the city to overcome it.

The different departments of live stock were well represented and although a few classes may have been slightly deficient yet on the whole we consider the live stock the best showing ever made in Halifax.

The dairy department showed exhibits of superior quality and reflects great credit on the part of the exhibitors. We were pleased to find the different creameries of the Maritime Provinces well represented but as there still is and always will be a large amount of home dairying done we would like to see more competition in this line and all possible encouragement given it.

In the speed department all the contests were carried out to the satisfaction of all concerned and the general verdict is that it was the best race meet yet.

The other departments were about as usual, the Mines and Fisheries showing considerable improvement over 1913.

The financial statement for the year 1915 showed an expenditure of $34,276.71; receipts, $29,381.42; balance expenditure over receipts, $4,895.29.

This financial showing is considerably better than we dared to expect and we feel that it should be satisfactory to all concerned.

In conclusion we wish to express our gratefulness to the exhibitors for the manner in which they responded, and also to all others who in any way helped to make our provincial exhibition the success that it proved to be, more particularly in a year like this when so many tried to discourage us by predicting certain and absolute failure. We don't feel that the exhibition is above criticism and would welcome it but nothwithstanding any faults, it may have, it is certainly doing an educative work which could not be done otherwise for the same expenditure.

In presenting this brief report we ask you to give the exhibition your fullest consideration. Discuss it thoroughly, as there is no way in which faults will be brought to the notice of managers and thereby corrected and improvements made as by honest, straightforward discussion.

Thanking you for the confidence placed in us and hoping we may have proved ourselves worthy of it, we hereby submit the above report.

H. S. KENNEDY,
F. W. FOSTER,
Commissioners.

Resolutions

Following are the resolutions and the action taken on same.

Resolved that section 8 of the By-Laws and Constitution of the Nova Scotia Farmers' Association be amended by striking out in lines three and four of said section the words "one dollar and fifty cents" and substituting the words "two dollars."

Moved by D. F. McLean, seconded by Wallace Rhodenizer. Adopted.

* * *

Whereas experiments conducted in Nova Scotia have proved that an application of 2 to 4 tons per acre of ground limestone has markedly increased the yields especially of clover, the growth of which crop is essential to permanent fertility and the consequent bigger production from the farms of the province and,

Whereas a great obstacle to the free use of this limestone is the large amount of freight that is now paid on the amount of limestone used per acre and,

Whereas a consideration of similar facts has lead to substantial reductions of freight rates on this limestone in the United States,

Therefore, resolved that this Nova Scotia Farmers' Association do respectfuly urge the railway and steamboat corporations operating in the province to transport this limestone for agricultural purposes at especially reduced rates.

Moved by Rev. Gordon T. Lewis, seconded by Walter Churchill.

This resolution was referred to the resolution committee who recommended that a committee be appointed to take this matter up with the different transportation companies.

Adopted and Prof. Cumming appointed committee to act on the recommendation of the resolution committee.

* * *

Whereas the farmers of Canada have been called upon for an increased production of farm crops and,

Whereas the judicious use of commercial fertilizers is imperative to the farmers of Nova Scotia, being the raw material necessary for the successful production of his crops,

Therefore, resolved that this, the Nova Scotia Farmers' Association now in session at Windsor respectfully petition the government of Canada to remove the duties on commercial fertilizers. —F. W. Bishop, R. M. Jackson.

Adopted and placed in the hands of the legislative committee and Prof. Cumming.

* * *

Whereas, the annual exhibition held at Halifax is intended first of all to be an agricultural and industrial exhibition, and as such, with educational features which could be adopted would commend itself to the people of the province at large and,

Whereas, the show last year, 1915, was absorbed largely by a low class vaudeville show which could not commend itself to the right thinking people of the province.

Therefore, resolved that this Nova Scotia Farmers' Association strongly protest against the presence of the fakir element at any exhibition in the future.—John A. Scott, Wm. O'Brien. Adopted.

* * *

To the Legislative Council of Nova Scotia:

Whereas your honorable body have been enacting laws to improve the horse stock of the province of Nova Scotia, and

Whereas the Stallion Law as it at present stands is not effective enough owing to the large number of grade and unsound stallions offering for service;

Therefore, we ask your honorable body to add a clause to the present stallion law doing away with all grade and unsound stallions before January 1, 1918.

We would also ask to have an inspector appointed at once for the purpose of enforcing the stallion law as it stands at present,

* * *

A committee appointed to consider the question of co-operation for the farmers of Nova Scotia brought in the following recommendation which was adopted unanimously:

This committee reports first that they would recommend the act of 1908, Chapter 33, as the basis for co-operative organization. Second—That a comittee of three be appointed by our directorate to take up the matter of organization and to appoint or recommend an organizer and at the same time to find if the United Fruit Companies would permit such new organizations to become subsidiary to them.

* * *

This association regrets that the government did not favorably consider the strong resolution passed at our last session asking that the Nova Scotia Temperance Act apply to the City of Halifax, at least during the war.

We further place ourselves on record strongly favoring the cancellation of liquor licenses in Halifax, March 16, 1916. We respectfully ask the provincial government to take immediate action.—John A. Scott, G. W. Spurr. Carried.

* * *

Whereas, the menace of allowing grade or scrub bulls to be used for service has been for many years acknowledged by the best farmers of Nova Scotia.

Therefore, be it resolved that we recommend that steps be taken to obtain such legislation as will remove this menace and to this end that a uniformly worded petition in blank be sent to each agricultural society in the province with the request that the members sign their names and return to the committee appointed for such purpose.—R. J. Messenger, Wm. Murray.

Adopted, and the following petition in blank authorized to be send to each agricultural society in the province for the signature of the membesr:

Petition

—We, the members of Agricultural Society respectfully request that legislation be enacted to prohibit the use for public service of grade or mongrel bulls within the limits of Agricultural Societies and Live Stock Associations, or wherever pure bred bulls are otherwise available, for public service, at reasonable fees, in the province of Nova Scotia.

A FLASH LIGHT PHOTO OF THE NOVA SCOTIA FRUIT GROWERS' ASSOCIATION.

Front Row, Left to Right.—A. E. McMahon, ex-President; George E. Saunders, Dominion Entomologist, in charge of Laboratory at Annapolis Royal; W. Saxby Blair, Supt. Experimental Station, Kentville; F. A. Chipman, President; E. H. Johnson, Director; M. K. Ells, Secretary; F. W. Foster, Assistant Secretary; A. S. Banks, Director; Miss Fielding, Official Stenographer, appears at the left. Two of the fathers of the Association, Messrs. W. S. Spurr and R. W. Starr, are in the second row respectively, behind Messrs. Saunders and Blair. John Donaldson, President of the United Fruit Companies, is on the extreme right, third row back. Dr. Cutten, of Acadia University, is third from the right in the third row.

Education for Country Life.

An address given at the Teachers' Short Course, Sussex, N.B., January 5. 1916, by S. B. McCready, Rural Science Department, Prince of Wales College. Charlottetown.

As teachers beginning the New Year in a special preparation for a special service in country life betterment, I wish to place before you a few things, the consideration of which may make your work in the class room more effective or your influence as a practical education reformer, the greater in your community. For, note this—that the winning of people in the country to new ideas about education will always depend very largely on what is presented to them through their children in the plain, everyday teaching of the not plain but attractive, everyday teachers like yourselves. Don't forget that it is upon what you do, not upon what some other person thinks, that the world's progress depends. Only what you put into effect of this course will count in solving the problem in New Brunswick of adjusting education to meet the needs of country life. I wish you a Happy and Prosperous New Year in the new leaves you are turning over this week.

The Nation's Dependence on the Country.

Education for Country Life.—Let us examine our terms briefly. As teachers who aim to be educators—and the two are not always identical—what are we to strive for? Setting aside the responsibilities of the teachers office as they pertain to the child himself and to the child in relation to his home, what are the teacher's obligation to the state?

This new work that you are entering into is distinctly a civil service—a service for the state. You are participants in a Dominion-wide national educational movement. The money that is making this work possible has been voted by the repesentatives of the Canadian people at large in the Federal Parliament. You are chosen to put into practice New Brunswick's expression of a Canadian-felt need.

I do not need to specify that. Our last census, that of 1911, revealed it. Every intelligent Canadian appreciates it. Everywhere in Eastern Canada a serious depletion of rural population has been taking place. The substructure of our social fabric has been much undermined. The foundation stock on which the best in citizenship is built, at a time when its virility is most needed, has become attenuated. The industry most fundamental to stability and steady progress, has been threatened not from without, but from within. In these losses, New Brunswick has shared in a large measure.

New Brunswick's Possibilities

I have been told by responsible persons, whose judgment may well be trusted, that there is no part of Canada today where the possibilities in agriculture are greater than they are in New Brunswick. What does that mean? It means that there is a job worth working at right at our door. That there is something to be discovered right here which thousands and thousands of New Brunswickers went to find in the United States, in British Columbia and other far parts of the earth. That the population may be conserved. That wealth may be increased. That homes may be multiplied. That there may be a Greater New Brunswick than has been!

And how will this come about? Through Education largely. Through the schemes of education that we have hitherto followed? Hardly. But through the new kind of work that you and your successors will do in the schools in the next ten or twenty or thirty years.

The Farmer's Work Analyzed.

Let us look closely at a farmer's work. We need to know what is required of him in order to know how he may be served in education.

In the first place he is a Laborer; by the sweat of his brow he accomplishes much of his work; though with the advent of cleared land and labor-saving machinery much of the outward sweat is being replaced by internal sweat. But he must labor, and always will have to do hard work—and a good thing for the old world that there must always be hard work! He must not only hew wood and draw water; he must dig and trench, lift and haul, reap and sow, milkcows, clean stables, erect fences, plow and harrow, build and plain, work faithfully and steadily year in and year out.

In the second place he is an Agriculturist; he has the three fold work of tilling the soil, growing crops and raising animals.

As a tiller of the soil, he clears land, drains it, plows it, harrows it, cultivates it, fertilizes it. The soil is the source of all his wealth. If he abuses it, he suffers. If he does well by it, he benefits and the world at large benefits. If he leaves it better than he found it, he is a public benefactor and deserves well of posterity as a good citizen. If he leaves it poor and depleted, he has stolen from posterity; in ignorance, it may be, but New Brunswick is poorer for his having lived in it. His has not been the service of a patriot.

As a grower of crops, he sows and tends, harvests and threshes, cleans and sows again, or feeds and returns manure to the soil from which he took the crop. He grows grasses, grains, roots, vegetables, trees, fruits. He deals with plant life in a thousand forms. He has to wage a continual warfare against the enemies of these cultivated plants. Weeds and insects and diseases are entrenched in his fields and orchards or lined up ready for attacking him on all his boundaries. He must ever show skill and vigilance and endurance.

In preparation for the fight against

THE MARITIME FARMER.

And Co-operative Dairyman

Registered Trade Mark

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

RATES FOR CASUAL ADVERTISEMENTS.

1 inch—First insertion 75 cents 2 inches—First insertion $1.50; inches—First insertion $2.25.

Contract rates on application.

Address letters and make all checks, money orders, postal notes, etc., payable to

THE MARITIME FARMER, or

BUSINESS ABILITY APPLIED TO GREATER EXTENT WOULD RAISE FARM PRODUCTION.

A strong plea for greater care in farm management and for a more conscientious application of accepted farm principles which were common property was urged by Professor J. H. Grisdale, director of the Dominion Experimental Farms, in his address on "Farm Management," given at the Ottawa winter fair. This, Prof. Grisdale declared, would increase production by at least fifty per cent.

Farm management was farm business, he stated. The reason why the capitalist did not make good as a farmer, was because he did not have good managers. Farmers in general were not balancing labor and investment against the profit. The farmer must be careful of his investment, and not let sentiment an dsimilar influences distract him. He could point out a dozen farms where the scenery was fine, but that did not help the interest any; others, also, that the farmers' grandfathers had owned, but too much sentiment was not wise in that direction either.

The farmer fell down, besides, on working capital; many hate to put a little more money in as working capital into just a little better horses, implements, buildings, etc., though some believed that an adequate working capital was necessary and that money investment should not be overlooked for satisfactory returns.

"We must have a knowledge of farm values," said Prof. Grisdale. "This makes the farmer able to grasp the importance of the little things which are an indication of thrift, though it is a mistake to spend too much time on the little things, for farming is a big enterprise."

There should be the proper balance of farm livestock and crops. He liked to see just a little more livestock than the farm could carry rather than the other way, so that one could be sure that all the material would be used up, and a small investment to carry the balance would not hurt.

The right kind of livestock should be kept. The farmer who made a success must produce at low cost and utilize the feed for the greatest money earning possibilities.

Dealing at length with the cost of production, which, he said, was one of the most important problems in the country today, Prof. Grisdale first stated that all operations must be timely. "I believe honestly,' 'said the speaker, "that 25 per cent. of our farmers are not timely in their operations; either they don't know, or they procrastinate, for they fail to do the right thing at the right time."

Thoroughness was important; in fact, it was almost a negligible quantity on Canadian farms. Referring to what Mr. Leitch had said previously about not farming too intensively, Prof. Grisdale said there would be absolutely no fear of overdoing it "Until we learn to do better," he said, "we shall fall far short on crop production."

The question of power, meaning horses available, was often neglected or mismanaged. There should be four or five horses at least on a farm of 100 acres, for to be under-horsed meant to be under-cultivated. He gave some interesting observations on the cost of wintering horses, pointing out that, on one government farm this was being satisfactorily done on oat straw and a handful of grain while on some other farms the cost was several times greater.

Big machines were valuable to bring about lower cost of production, and he advised that the next machines bought by his aduitors be large ones. A large seeder, for instance, would cut the cost of seeding almost in two.

One of the most important of details in farm management was to have a system of some kind with regard to crops. This was so much a fad of his that he would refrain from discussing it at length, except to say that the man who did not follow a good retation would get only one-half or two-thirds of the crops he ought to have.

Winter work was important, for there were many odds and ends that should be attended to, which were too often overlooked.

The market was worthy of deep and close study. It was not sufficient to simply operate as their fathers had done; farmers must become more thorough business men. He could point to a place not 200 miles from Ottawa where the capital invested in a farm amounted to hundreds of thousands, and where large profit had been made this past year.

Co-operation would be found most advantageous in many ways, continued Prof. Grisdale, for it was a good way to obtain large returns, besides paving the way to the introduction of the large machine. Co-operation could be practised in working, buying and selling, and would do much to increase the chances of profitable returns. It was true that returns were pitifully small, on the average in Canada, and they were still smaller in the United States, according to government bulletins.

Dealing with the question of money crops, he said that it was not necessary that everything grown on the farm must be consumed on the farm. On almost every farm there was some possibility along this line, and to have some small thing for sale at different times of the year was very acceptable indeed.

"Concluding," Prof. Grisdale said, "the whole thing practically is that, if we would make the most out of farming operations, we must be prepared to use business ability to a much greater extent. I am not strong for an extensive system of bookkeeping, though I have seen lots of systems and had them submitted to me for purchase by the government or for recommending to the farmers. I have yet to see any system that would justify any great expense. Keep books simply, and have a knowledge of costs, etc. Most of the losses on farms result from not knowing where we are at, and there is scarcely a farmer that is not doing something at a loss and does not know it. The requirement is thought; we must think to make anything go, and especially farming."

BOOZE AND THE SHEEP BUSINESS.

Commenting on the fact that five western sheep states have gone dry, the American Sheep Breeder, of Chicago, makes this original and unique proposition to those of its readers wno work in the sheep folds for wages:

"Pledge us your word of honor that you will cut out booze for twelve months and you may have the American Sheep Breeder free of charge for one year. This is our treat, boys. Who will be the first to accept it?"

"The Breeder goes on to say that "the elimination of booze means better flock masters, better shepherds, better ranchers, better sheep, better wool, better mutton, better husbands, better fathers, better brothers, better sweethearts, better towns, lower taxes, less crime, fewer lunatics and paupers, and a richer and happier people in every way."

SUCCESS FOLLOWED MISTAKES.

There is but one highway open to real success, and this is persistent, consistent and intelligent application to something is that worth while. A very successful dairyman, over sixty years of age, recently said: "I have made the greater part of my money since I was forty-five. Up to that time I was principally engaged in making mistakes. I was following the example of my neighbors, who were not real thinking dairymen. Then I struck out for myself, and I have been correcting a host of mistaken notions about cows, stables, feed and farming in general. The difficulty with many dairymen is, they never wake up.

An old farmer who kept up the fertility of his farm was asked how he did it. His answer was right to the poitn: "I always plow something under." He fed his land humus-making material. Either it was a good dressing of manure, a crop of rye grown for that special purpose, or something else. He had been frequently known to plow under a good second crop of clover contrary to the ideas of his neighbors who would save it for hay. But this old man kept growing bigger and bigger crops because he held steadily to the rule to always "plow under something."

Science and practice, helped by experience, that is what we want. Experience means that which we have ourselves learnt; that which has been knocked into us so forcibly is never forgotten. This is why we have often advocated that "every farmer should be his own experimenter."

A farmer recently told of a new malady with which city folks are occasionally afflicted. It is called "Farmonomania." Dictionaries today do not include the term, though coming editions must do so. It will be defined as a fantastic brain storm on rural economics.

NOVA SCOTIA INSTITUTES

The Annual Short Course for women and the Third Annual Convention of Women's Institutes held in the new Science Building at the Agricultural College in Truro this year were more interesting in many ways than any that have preceeded. The Short Course was for the first time given in a suitable building, suitably equipped. This building occupies a prominent site on the College campus and is a massive structure of grey stone and brick. The second floor of this fine new building is devoted exclusively to the interest of women in Nova Scotia, and perhaps a short description of it will be interesting to your readers. To your left as you come up the stair is a large lecture or Assembly Hall, splendidly lighted by day or night which will seat about five hundred people. The seats used are oak settees with broad arms capable of holding a note book so that one may take notes with comfort and with convenience. This hall is provided with equipment suitable for demonstrations in cooking, etc. Just next to it is a library and across the hall cloak rooms and an up-to-date lavatory. The room of most interest, however, with its long tables covered with shining aluminum and fairly bristling with drawers and cupboards, a peep into any one of which will make the heart of a housewife glad, equipped as they are, most thoroughly, with all the tools necessary for the trade of housekeeping. Especially comfortable chairs with one broad arm for note taking are provided. A laudnry class room is only divided from this room by pillars and the chairs of the cooking class room are available therefore for lectures in laundry work. An office, closets and pantry complete this floor, which without doubt is one of the best in the Maritime Provinces for the teaching of Household Science. The walls are in brown and buff and the woodwork in oak, this color scheme being particularly attractive and very restful.

The classes this year were especially well attended, and great enthusiasm was evinced by the pupils, whose ages ranged from a small girl in short frocks to a dear old grandmother who was glad to know of some new cookies to make for her two sturdy little grandsons. It was interesting to see mother and daughter working side by side and to note the delight of experienced housewives when their pastry and doughnuts turned out exceedingly light and undoubted successes. "What indigestible stuff to have taught at a Short Course at a Science Building!" some one will be sure to say. Very true, but as long as the human race exists, it will insist (especially the male portion of it) on eating pies and doughnuts, so it is just as well to know how to make them properly so that the pangs of indigestion may be somewhat lessened. Thus along with many other more valuable things, these were also taught, and to tell the plain, unvarnished truth the two lessons on Pastry and Deep Fat Frying were the two in the course that aroused the greatest interest among the pupils.

There is no doubt that many hints are given at one of these Short Courses as to proper combinations of food, proper preparation, proper cooking and the nutritive value of foods, etc. But in a fortnight only the merest outlines of the subject can be touched upon and there are so many other allied subjects that must stand aside and still are quite as important, that the question of longer and more effective courses comes up. With improved facilities it is hoped to solve this question satisfactorily and to place before the women and girls of the province a four to six weeks course, combining practice and theory in an efficient and attractive manner. A course of this kind takes not only time but money to carry out effectively, usually there is enough of the former but unfortunately the latter, which is most important, is something lacking, but remembering the good old adage, "Where there is a will there is a way," we trust that the way will be found.

The Third Annual Convention of Women's Institutes was held during the second week of the short course from Tuesday evening, January 11th to Thursday evening, January 13th, and was splendidly attended by a representative number of delegates from all over the Province. The opening meeting of the Convention was also the formal opening of the Science Building and Dr. C. C. James of Toronto, Agricultural Commissioner, gave the opening speech. The hall was packed to the doors, the crowd even overflowing to the first floor so eager were they to hear this talented speaker. The other speakers at this meeting were Premier Murray of Nova Scotia and Hon. J. A. Murray of New Brunswick and all were particularly good. Owing to the crowded condition of the hall the meeting adjourned to the Main Building, where an interesting musical programme was given through the kindness of the Truro Town Council. Day sessions of the Convention were given over to reports of the Institutes, business and a question box, with a very clever paper from Mrs. Wiltshire of Round Hill, a short address from Mrs. Stanfield, president of the Local Council of Women, Truro, and the Superintendent's report. The reports from the Institutes were listened to with great interest, as each delegate told of the splendid work that had been done by her Institute, not only for local affairs, but for the many forms of patriotic work. Wednesday afternoon the delegates were entertained at a reception by the Executive of the Local Council of Women, at the residence of Mrs. P. McG Archibald, Vice-President of that Society. It was a most enjoyable occasion and the delegates were very grateful for this opportunity of meeting one another. Wednesday evening the delegates had the pleasure of listening to Mrs. F. H. Sexton, of Halifax, lecture on Red Cross. Mrs. Sexton is without doubt the foremost woman speaker in Nova Scotia and given a subject as full of interest as Red Cross, it can be imagined the lecture was exceedingly good. The closing meeting was addressed by Rev. J. Macartney Wilson, of New Glasgow, who had just returned from a three months' sojourn in France, where he has been engaged in Y. M. C. A. work among the soldiers. His

Twelfth Annual Convention N. S. Farmers' Association

(Continued from Page 276).

Officers for 1916.

The election of officers resulted as follows:

President—R. J. Messenger, Bridgetown.

1st Vice-President—Wm. Murray, Westville.

2nd Vice-President—Samuel Freeman, Amherst.

Directors—H. A. Moffat, Grove's Point; Walter Churchill, Yarmouth; Ronald Chisholm, Antigonish; C. A. Maxwell, Mount Thom.

Secretary-treasurer—C. R. B. Bryan.

Exhibition commissioners—H. S. Kennedy, Stellarton, F. W. Foster, Kingston.

Auditors—Profs. J. M. Trueman and J. P. Landry, Truro.

Legislative committee. — William O'Brien, Windsor Forks, W. W. Black, Amherst.

Co-operation organization committee —A. S. McMillan, Antigonish; Wallace Rhodenizer, Bridgewater, and H. S. Shaw, Berwick.

"Methods of Improving the Potato Crop," was the subject of an instructive address by Prof. G. C. Cunningham, Dominion Plant Pathologist, for New Brunswick, after the various addresses of welcome and replies thereto had been made at the opening session.

Prof. Cunningham gave figures showing the total acreage and total production of potatoes in the respective eastern provinces of Canada which showed that the average yield per acre was very low when compared with the high production per acre secured by farmers who pay particular attention to the essential detail connected with the growing of this important crop.

The first essential for a large yield is that the soil be well prepared and well fertilized. The second essential, good seed, preferably procured from the highest yielding hills at digging time. The speaker thought it as necessary for a farmer to know the producing records of the various strains of potatoes grown by him as it is for him to know his live stock records. The seeds for a high average yield crop must be good at the start, free from disease and the farmer must take good care of it. He then went on to deal with the question of prevalent potato diseases and how to combat them. Spraying with Bordeaux mixture five or six times in the course of the season was, other conditions being right, a sure insurance against low yields, even in seasons when neglected fields were total failures.

On Wednesday Afternoon

Dr. J. Sinclair, V.S., of the N.S.A.C., Truro, gave an excellent talk on Horses and their care and feed, from birth to maturity, also the care and feed for the in foal mare. He gave convincing figures that showed that while the average price for horses is low at present, horses of good breeding, well developed and well cared for bring remunerative prices.

R. S. Hamer, of the Live Stock Branch, Ottawa, followed with an interesting talk on "Market Problems of the Canadian Farmer."

"Limestone Experiments on the College Farm, Truro," and "Feeding Dairy Cattle" were the subjects of two instructive addresses by Prof. J. M. Trueman, of the N.S.A.C.

The use of ground limestone is a live question in the Maritime Provinces and naturally the experiments conducted by Prof. Trueman are being carefully followed by our most progressive farmers.

Prof. Trueman showed the clover crop gain in 1915 on two acres that had been treated with four tons of ground limestone at seeding time in 1914.

Size of Plot			Amount of hay: lbs.	Yield per acre tons.
1 acre	½	limed	3610	3.6
	½	unlimed	2550	2.5
1 acre	½	limed	3090	3.2
	½	unlimed	2570	2.6
½ acre	¾	limed	1490	3.0
	½	unlimed	1160	2.3
½ acre	½	limed	2010	4.0
	½	unlimed	1150	2.3
½ acre	½	unlimed		
	½	limed	3650	3.6
½ acre	½	limed	3050	3.1
	½	unlimed		

Crop, gain on two acres, limed: 1st cutting, 1.4 tons; second cutting, .8 tons. Total gain, 2.2 tons.

At the present price of hay the returns per acre from the results of the above experiment figures an increase of from $15.00 to $25.00 per acre on the first crop. Prof. Trueman explained that lime does not supply plant food and that it does best where there is a supply of humus. In reply to a question, Prof. Trueman said two tons of ground lime was equivalent to one ton of burnt lime. He also said most authorities recommend an application of two tons ground lime per acre.

Prof. Trueman's address on "Feeding the Dairy Cow" brought out an interesting discussion. The farmers were particularly interested in the possibilities of O. P. V. ensilage.

Prof. Cunningham's address on "How to Eradicate Club Root in Turnips and Cabbages" was followed with keen interest.

In explaining the appearance of club root, the speaker said the disease was caused by a microscopic organism that lives in the soil from year to year. He claimed the disease could be spread through the agency of seed, seedlings, soil, barnyard manure, farm implements and the horses' feet and men's boots while operating on the soil.

The best prevention is found in a long crop rotation, destruction of diseased roots, proper drainage and the application of lime at the rate of three tons per acre, air slaked or 5 to 6 tons crushed limestone.

He showed a chart of a field on which prior to liming, the whole cabbage crop had been a total failure owing to club root. Following the application of 150 bushels air-slaked lime the first crop showed 60% diseased plants. The second crop 1% diseases plants; and the third crop was free from disease.

Following the application of 150 bushels unslaked lime, the first crop was 96% diseased, the second crop 15% diseased, and the third crop free from disease.

Following an application of 150 bushels air slaked lime and 100 bushels unslaked lime, the first crop was 56% diseased, second crop and third crop disease free.

Following an applicatio nof 150 bushels air slaked lime the first crop was 85% diseased, second crop 10% diseased, and the third crop clean.

On the control plot where no lime was used the three crops were 100% diseased.

Professor Cunningham is confident that club root can be eradicated by the use of lime.

The question "Should Agricultural Societies and County Farmers' Associations become Co-operative Bodies for Buying and Selling Farm Supplies?" was discussed in a business-like way and before adjournment a committee consisting of A. S. Millan, Wallace Rhodenizer, and H. S. Shaw was appointed to carry on organization work and ascertain on what grounds the United Fruit Companies of Nova Scotia can be used as a central body.

Prior to closing votes of thanks were tendered to the retiring president, A. S. McMillan, and to Wm. O'Brien, for their active interest in furthering the work of the Association. Thanks were also extended to Mayor Roach and the citizens of Windsor for the use of the Hall and the very pleasant entertainment they furnished at the opening session. The meeting closed with the hearty singing of the National Anthem.

HORTICULTURE.

Degeneration of Potatoes.

To the Census and Statistics Monthly of October, 1914, (Vol. 7, No. 74, p. 251), a short note on change of seed was contributed by the Seed Commissioner of the Department of Agriculture in reply to an inquiry received by the Census and Statistics Office from one of its crop-reporting correspondents in the Province of Saskatchewan. The note had some reference to potatoes and especially to the desirableness, where the crop has been reduced in vigor by growth in a hot, dry, climate, of obtaining fresh seed from a cool, moist locality. The potato is however a plant possessing special characteristics of its own, and the following notes dealing more with the deterioration to which it is subject may be of interest in this issue of the Census and Statistics Monthly which contains other articles relating to potatoes.

The question of "degeneration" in potatoes is one that has attracted the attention of practical growers for a great number of years. From the frequent discussions of the subject I consider it reasonable to assume that a belief in the "degeneration of potatoes" is almost an article of the farmers' creed. Quite frequently poor crop yields, susceptibility to disease, and other effects of failure are excused as being due to "degeneration," "running out," "lack of vigor," etc.; these latter phrases, be it noted, being merely circumlocutions for an idea implied in the term "degeneration."

Though this concept of the word by the practical and even by the potato breeder is correct, the usage of the term itself apepars to, and does actually, involve a fatal misconception of the true inwardness of the term. Hereditary degeneration, i.e., a decline in the progeny due to pre-existent weakness of the parents, is well known, and many examples might be quoted from both the animal and plant kingdoms. In this phrase we imply parentage, and reflect upon the parents either male or female, or both. Let us then use a term, which I am not aware has hitherto been employed, viz., chromosomatic degeneration, as opposed to somatic deterioration, to which I shall presently refer.

Chromosomatic degeneration, or degeneration pure and simple, as we conceiv it, is the manifestation of a certain failing or decline transmtited from parents to offspring and perpetuated throughout subsequent generations, or even handed down in intensified ratio to them, until the stock becomes so greatly enfeebled that sterility put an end to the line. This effect is due to the transmission of inheritable degenerate characters by means of the chromosomes of the parent. These chromosomes are the small bodies in the male and female germ cells, which conjugate in sexual reproduction, and they may be regarded as the "vehicles" of latent or dominant characters both of the male and of the female parents. One example may suffice to interpret to the lay mind the bearing of this somewhat technical exposition. Alcoholism, especially in both parents, will invariably show up detrimentally in the children, and they, being likewise so afflicted, will in turn give rise to mentally and physically feeble progeny. The degenerative taint has been transmitted by the chromosomes of the parents.

Let us, therefore, clearly understand that degeneration is a term, which should properly be employed only where sexual reproduction plays a part; hence our use of the qualitative epithet chromosomatic, in order to define accurately the meaning of the loosely used word degeneration.

Now does sexula reproduction enter into the commercial growing of potatoes? No. People who claim that "degeneration" takes place in potatoes clearly confuse the proper significance of the term. Potato varieties originate in the first instance by sexual reproduction. A new variety of potato can only result from cross fertilization of parent plants, which are allowed to set seed, and from this seed the new variety is grown initially. Subsequently the tubers are vegetatively multiplied and perpetuated by their use as seed potatoes for planting. This vegetative mode of reproduction is essentially identical with the methods of raising plants from cuttings, or of perpetuating hyacinths or tulips, for instance, by means of bulbs, apple varieties through grafts, or roses by budding. When the breeder has raised his new variety, and considers it worthy of perpetuation, it has passed through a long series of improvements and selections, and is, ex hypothesi, superior at the start to the parents from which it is derived.

The question which now requires to be solved are these. Do these varieties deteriorate, and, if they do, how does deterioration show, and can it be remedied?

A plant almost exclusively reproduced by vegetative means, should not deteriorate; one cutting, one single tuber is just as good, or just as bad, as the plant from which it was taken. A thousand tubers from the same stock should grow in the same way as did the initial parent plant. Here a passing mention must be made of mutation, or the sudden change in some characteristic of an offspring from the corresponding feature in the parent—a phenomenon which has been observed in a number of instances. But the only instance known to us—Labergerie's famous mutation of a white variety into a variety known as Blue Giant, or something very similar—is not by any means authentic enough to be taken into serious consideration.

In so far as chromosomatic degeneration of potatoes is concerned, we know of no single instance, nor have we found any literature that contains authentic evidence in support of such a claim. Indeed one plant breeder of world-wide fame, Professor Fruwirth of Vienna, expresses a view on the subject, which clearly supports our own conception. He says: "True degeneration of a variety, which would manifest itself under uniformly favorable conditions, and when superior seed potatoes are used, has not been proved, and is improbable.

This author cautiously refers to the use of superior seed potatoes, which should be grown under uniformly suitable conditions. "Evidently, then, there is a "degeneration"—some adherents of the doctrine of "degeneration" will exclaim—"if one does not use superior seed potatoes, and raise them under suitable conditions!" A deterioration is just exactly what does happen, but it is no more due to degeneration proper (chromosomatic degeneration) than for the sake of argument, to mutation.

It is generally claimed by the practical grower that a variety of potatoes, if grown for a longer or shorter period in one particular locality, will eventually give decreased yields, and generally show signs of "degeneration," or "running out." We are able from experience to corroborate this deterioration, but, whenever we have carefully investigated the question, we have been able to prove that such behavior has been due to a variety of causes. There can be no doubt that certain localities, perhaps because of climatic or soil conditions, will more quickly affect the yielding capacity or vigor of a variety than other localities. Deterioration may also be due to the use for seed purposes of tubers originating in such localities. Indeed the experience of the Dominion Horticulturist at the Central Experimental Farm has shown that Ottawa is a typical locality which affects detrimentally the quality, vigor and type of potato varieties more quickly than has been found the case elsewhere.

The perpetuation of a variety in such unsuitable localities will graudally result in the production of an inferior type. But experience also shows that it is possible, by patient selection, and, above all, by growing these "varieties reduced in vigor" under more suitable conditions, for them to regain their prestine quality and vigor. Is this "regeneration"?

In view of the above explanations we do not consider such cases of loss of vigor in the light of true degeneration, but we have here evidence of a type of decline, which we are inclined to regard as somatic deterioration, as opposed to true or chromosomatic degeneration. Somatic deterioration refers to the decline in the cells of any individual body, or to what is generally, but loosely, spoken of by the practical grower as running out, strain weakness, or "degeneration." It is very distinct from chromosomatic degeneration, since it is not due to any parental imperfection, but is largely due to numerous conditions exerting influence upon the individual.

To use again an illustration, which may bring home to the lay mind an essential difference between this deterioration and degeneration, an analogous case in human life—and one due also to similar unfavorable climatic causes—occurs in the undermining of European constitutions through residence in tropical countries. Is the grower with his "degeneration of potatoes" sufficiently logical to dare to apply the term "degenerate" to, say, our warworn heroes invalided home with broken health incurred from exposure to the damp and cold of trench life in winter?

It must be realized then, that a potato plant grown under conditions of starvation will produce smaller tubers than one grown under the most favorable conditions; a tuber produced by the former plant—which tuber is merely a cutting—will produce a very superior yield, if it is grown under the most favorable conditions. Hence the apparent deterioration is not inherited, since a cutting has no true parent plant from which to inherit anything; but if will continue to behave as the plant of origin did, providing the climatic, cultural and other conditions are perfect.

We have mentioned above the decline of varieties due to unsuitable conditions. Continue growing plants under these conditions and you will gradually produce a weak plant offering no resistance to many kinds of disease, and these latter, then, will do the rest. The plant will eventually produce no yield to speak of, and farmers are satisfied that they have a case of "degeneration." We wish to strongly oppose this conception. It is most misleading, and the use of the term is in a fair way to become stereotyped and be used popularly. But it has on bearing upon the true state of affairs.

Farmers and potato growers have the remedy for deterioration in their own hands. It is beyond question that some localities in every country are more unsuitable for the growing of good potatoes than others. Where this is the case, growers are urgently advised to make a frequent change of seed. Preferably secure seed from a suitable locality every year, and then the grower will have no deterioration. By keeping one strain of potatoes in cultivation too long under any but the most perfect conditions the yields will be unsatisfactory, and diseases abundant. Even in localities where po-

BRUCE'S DOMINANT SEEDS

Just as the British Fleet dominates the World's waters, so "BRUCE'S SEEDS" are the dominant ones with the planter whose living depends upon "Real Seeds."

It will be even more apparent at this time, when many seeds are in short supply, that there will be more stocks offered by unreliable and inexperienced growers than in the past, and that houses with long established reliable connections such as we possess will have an incalculable advantage.

Why take a chance, when you can buy "The Best Seeds that Grow"—BRUCE'S—for very little more than so-called "cheap" seeds?

It costs as much to plant and care for poor seeds as good ones, and you have very meagre, unsatisfactory results to show in return for your labor.

CHEAP SEEDS ARE DEAR IF YOU GET THEM FOR NOTHING.

Send for our 128 page Catalogue of Seeds, Plants, Bulbs, Poultry Supplies and Garden Implements, full of valuable information, which is now ready and will be mailed FREE to all applicants.

STRAWBERRY PLANTS!

Now is the time to book your orders for Strawberry Plants for the coming Spring. Prospects were never better for high prices for Strawberries than for the next few years. One acre of berries will pay as much net profit as ten acres of potatoes or fifty acres of hay. Make Strawberries part of your regular farm crops. If you cannot raise them commercially do not neglect a few hundred plants for the garden. We again offer for sale the old reliable Senator Dunlap, the earliest, best shipping, strongest growing, most drought and frost resistant berry grown in the Maritime Provinces. Our plants are known as "The Plants that Grow." Prices for Dunlaps $3.50 a thousand, in orders of five thousand or over, $3.25 a thousand.

Other varieties, Sample, Williams, Valeria, Longfellow, Arnout, etc.

CATALOGUE FREE.

tatoes do normally well, it is advisable to practise selection of seed along recognized lines. This will eventually result in the production of heavier yields, and produce a strain that will be successful for a longer or shorter time elsewhere. No attempt should be made to grow seed potatoes in unsuitable localities.—By H. T. Gussow, Dominion Botanist, Central Experimental Farm, Ottawa.

Baldwin Spot.

The following quotation was taken from a letter recently received by the Maine Agricultural Experiment Station: "I am sending you, under sepatate cover, an apple covered with black specks; what do you call it When these aples were put in the cellar last fall, they looked perfect, but a lot of them are badly specked this spring. I am very anxious to eradicate this trouble and make my fruit as near perfect as I can."

The apple in question was affected by what is known as Baldwin spot, samples of which are quite frequently sent to the station, usually earlier in the season. Baldwin spot is so named because it was first observed on and occurs more commonly on the Baldwin, but it is by no means confined to this variety. Of the other kinds of apples affected by the disease, specimens of Greenings are perhaps more frequently received.

The trouble is characterized by brownish, and, in later stages, almost black, sunken spots or pits distributed irregularly over the surface of the apple. These are somewhat irregularly circular in shape, and vary in size from a sixteenth to nearly a fourth of an inch in diameter. In the earlies stages they have much the appearances of small bruises. When cut through, it is seen that the diseased tissue is somewhat hemispherical in shape, extending into the apple. This affected area is light brown in color, and has a distinctly spongy appearance, particularly if examined by the aid of a small hand magnifier.

In later stages the tissues beneath the spots dry out and become shrunken so that the pitting is deeper and quite marked. In later stages, also, the interior tissues of the fruit may show a browning in certain regions.

Frequently the Baldwin spot appears on apples as they are ripening, but in other instances it develops in storage. Usually, however, in storage it makes its apeparance in the early winter or fall. The disease may be confined to individual trees in an orchard or to certain branches of individual trees. Baldwin spot appears to be widely distributed in this and other countries, and although students of plant pathology in various sections have given it considerable attention, no definite proof has been obtained that it is caused by a parasite or can be controlled by spraying. There is some evidence for believing that it is in some way associated with defects in nutrition or lack of balance in the food supply. Just what is the prime cause of the trouble in individual instances is usually difficult to locate. Frequently where it appears on orchards in sod, it disappears when these are well fertilized and brought under a good system of cultivation.

Undoubtedly, Baldwin spot has been at times confused with another, somewhat similar appearing trouble which was first distinguished and described in New Hampshire a few years ago, but which is equally common in Maine. This last mentioned disease is produced by a parasitic fungus and can be controlled by spraying.

An important distinction between the two troubles is that the true Baldwin spot does not appear until nearly harvest time or in storage, while the fungous disease begins to show first about the middel of August. The first evidence of the latter consists of spots of a deeper red on the darker portions and darker green on the lighter portions of the surfaces of affected apples.

At this stage the spots are but slightly sunken, if at all, and there is no sugegstion of a bruise. The fungus spots on the red surfaces become more sunken later in the season, the color changes from brown to black, and in cellar storage the red spots become badly browned and sunken. The green spots may take a similar course, but in many cases there is no marked change in their surface appearance. The spots caused by the fungus are not, as a rule, so large, and do not produce so large pits in the surface, as are characteristic of the later stages of the non-parasitic trouble.

The funguous disease also occurs on a number of different varieties, but it is only on the Baldwin that there is much danger of confusing the two. On the fruit of certain light-skinned varieties, its appearance is quite distinct from that of the true Baldwin spot. The funguous disease is especially common on the Bellflower in Maine, where it produces very striking bright carmine-colored spots, often with very little injury to the skin until the later stages. In storage, the centres of these spots become browned, and sometimes slightly sunken.—Chas. D. Woods, Director Maine Experiment Station.

The New Brunswick Farmers' and Dairymen's Association.

Editor The Maritime Farmer:

The Executive Committee of the Farmers' and Dairymen's Association met in Fredericton on the 3rd instant.

Ts Association will hold its regular annual Convention in Fredericton, February 28th to March 2nd inclusive. An interesting programme has been prepared, special attention being given to the question of live-stock and dairying. Professor Barton, of Macdonald College, will be in attendance. Arrangements have been made with the Superintendent of the Dominion Experimental Farm here to spend one day at the Farm, where demonstrations and lectures will be given, in connection with live-stock and dairying, under the direction of Professor Barton. It is expected that there will be a large attendance of delegates from the Agricultural Societies at this session

Yours very truly.

J. B. DAGGETT,
Secretary for Agriculture.

Two Weeks' Course in Agriculture

AT THE

Agricultural School, Woodstock, N.B.

MARCH 20th to APRIL 1st, 1916

The First Week will be devoted to Fertilizers, Soil Management, Insect Pests, Plant Diseases and Spraying.

The Second Week will be devoted to all classes of Live Stock and Field Crops.

The only expense to you will be Board while in Woodstock and Railway Fare at Reduced Rates. Purchase a Single First-class Ticket to Woodstock and get a Standard Certificate from the Ticket Agent.

A list of suitable Boarding Houses will be provided to Students.

Applications for enrolment in this course will be received up to March 18th, but should be sent in as early as possible. Send applications and inquiries for further information and full program to A. G. TURNEY, Fredericton, N. B.

NEW BRUNSWICK DEPARTMENT OF AGRICULTURE,
HON. J. A. MURRAY, Minister.

Ayrshire Cow Giving 25,000 Pounds of Milk Has Come.

GARCLAUGH MAY MISCHIEF, 27,944. Imported and owned by Perfresen March 3, 1916.

Test begun December 27, 1914, test ended December 26, 1915. Due to fresen March 3, 1916.

May Mischief was born February, 1906, bred by Andrew M. Baird. Imported in 1910 by Mr. Percival Roberts, Jr., Narberth, Pa. She has produced three heifers and one bull since her importation.

What higher recommendation can we give for a dairy cow than that at ten years old she gave in one year over 25,000 pounds of milk, is due to freshen in a little over two months, and at the time of drying off was giving 50 pounds of milk daily.

Brandon, Vt., Dec. 30, 1915. C. M. WINSLOW, Secretary-Treasurer.

Ayrshire Champions in 1915 in Record Performance.

Of the 183 Ayrshire cows and heifers that have registered in the Record of Performance test in 1915 a large number exceeded the 10,000 pound figure for milk and over 400 pounds of fat. Only in the three year old class was the record broken and by the heifer, "Milkmaid of Orkney"—39834—, with 14,060 lbs. milk and 534 lbs. fat. She is owned by Harmon McPherson, Orkney, Ont., who wins a silver cup given by the Ayrshire Association on her production and also on the winner of the four-year-old class. W. C. Tully, Athelstan, Que., is also a winner of two of these cups, in the Mature and Two year old class. The basis of awarding these cups is one point for every pound of milk over and above the amount required to qualify. Twenty-five points for every pound of fat over and above the amount required to qualify and ten points for every day between the date of freshening after calving and the end of the fifteen month period. It is expected that these cups will be presented to the successful winners at the Annual Banquet of the Association to be held in the Carls-Ritz Hotel, Toronto, on the evening of February 2nd. The following are the three highest scores in the Mature class and the two highest in the other classes. The highest score in each class wins a silver cup.

"FAVORITE" CHURN (with Bow Lever)

Notice the adjustable handle on the bow lever. No other churn has this. Handle can be moved to centre or either side, whichever is most convenient for driving.

You can buy the "Favorite" in eight sizes. Strongest and best made churn on the market. Easy to work. Gives splendid results. Ask your dealer.

MAXWELLS, LIMITED ST. MARY'S, ONTARIO 1

Value of Skim Milk Explained.

Chemistry has opened up a new field for investigation in the last ten years by its discoveries in the realm of protein digestion and metabolism, how protein is converted into cell or body tissue. A single grain may consist of several different kinds of protein in a certain ratio, while another grain may consist of other proteins or the same proteins in a different ratio. It is for this reason that of two feeds containing the same amount of total protein, one may not contain the same proteins or the same proteins in the same ratio as the other and therefore may not be as efficient and of like value. Wheat contains certain porteins that are lacking in some one or more of the elements necessary for growth and reproduction, and into which protein is divided by digestion, and therein lies its inefficiency as a feed. Milk contains all the proteins necessary for proper growth and therein lies its great efficiency. These facts are well brought out by some experiments recently concluded at the Wisconsin Experiment Station.

In feeding pigs weighing from 50 to 60 pounds, they found that when the protein in the feed is taken from oats, wheat, corn, or a mixture of the three, that under normal conditions from 22.3 to 27.7 per cent of the nitrogen (protein) consumed is retained by the animal in building up its body; when the proteins in the feed came from milk casein and from skimmilk, and in only two-thirds the amount given in the grain, the pigs stored 45.5 and 63.2 per cent respectively of the nitrogen consumed, the skimmilk being the most efficient.

Not content with testing this on pigs, the experiment was extended to calves. Calves weighing 300 to 400 pounds were fed rations in which the protein came from corn alone and alfalfa alone, and calves weighing 100 to 125 pounds were fed rations in which the protein came from skimmilk alone. Those calves that received their protein from corn alone, retained 24% of the nitrogen consumed; those getting portein from alfalfa alone, retained 28% of the nitrogen consumed; while those that received their protein in the form of skimmilk retained 65% of the nitrogen consumed.

In the way of explanation it may be said that the retention of nitrogen represents growth and increase in body weight, and is merely a method of determining results accurately. If live weight alone were considered we might have the fact of the moisture content of the flesh disturb the exact determination.

We have often said in these columns that skimmilk seems to have a certain good effect in producing growth in calves that is not indicated in its chemical analysis. We have talked often of the value of skimmilk, and these experiments emphasize the matter more strongly than ever. It will be noted that for these growing animals skimmilk was from two to three times as efficient as the cereal grain proteins.

In discussing the value of proteins from different sources, Professor E. B. Hart, who is in charge of the animal nutrition investigations at Wisconsin, called our attention to the report we printed last November concerning the Indiana experiment in the use of equal amounts of blood meal, hominy meal, linseed oil meal, and red dog flour as a calf meal substitute for skimmilk. He said he felt quite certain that the efficiency of that calf meal resided largely in its inclusion of blood meal, an animal protein. The growing animal seems to require for its proper growth this animal protein, which is only found in milk or the protein tissues of animals.

Butter from Whole Milk.

I would like to get some information regarding the method of handling milk where the milk is churned instead of separating and churning the cream. Can as good butter be made this way as from cream?—L.M.C.

We consider it a wasteful practice to attempt to produce butter from whole milk. It is far better to separate the cream, even by gravity system, than to attempt to churn whole milk. The loss of fat would be too great to make any profit out of butter-making and further we can see no advantage in churning butter from whole milk but many disadvantages. It is a long, tedious process to get butter out of whole milk and in some cases it is doubtful whether any butter could be obtained by churning whole milk.

Increased Yield.

"In general results, note that this dairyman, after two years of record work, has increased his average yield by 2,151 pounds of milk and 65 pounds of fat per cow having gone up from a yield of 7,368 pounds of milk and 240 lb. fat from each of 15 cows, to an average from 16 cows of 9,519 lbs. milk and 305 lbs. fat.

"Thus he obtained last year, over and above the yield of two years ago. an additional weight of 41,784 lbs. of milk, worth at least four hundred and fifty-nine dollars. It pay, pays handsomely, to keep dairy records.

"Let me press this poitn again; cow testing stands four square on this plank of individual cow responsibility. The average cannot be poor if each individual is known to be good. It is each man's province to see if the meal ticket of any cow that he owns has run out. Make each one ring up her production on your precise cash register or herd records. Let no cold blooded statistics dare say of this, or any other country in grand old Ontario, that twenty or even ten per cent of the cows kept are disgraceful, hardy-perennial boarders. That might occur in some only semi-ready diar district amongst half-hearted dairymen.

"If you want in your herd several queens of the milky way, dairy records will help you—they deliver to you at stated intervals, a birthday cake for the mind, freshly baked, with candles lighted to illuminate your judgment of individual performance, your route march plans for steady advancement. The knowledge of the average or total, alone, cannot satisfy.

Testing Will Do It.

"Surely we don't need to have the poor cow always with us. Dairy records are at your service to discover and retain good cows. Instinct tells us there must be some reason, some significance behind each breadth; is it not a rational object of human existence to get the best and the most out of life? Possibly some have been too busy getting a living with poor cows to have time really to live. Cow testing steps in to say that great-hearted nature is your to work with—you have harnessed dewdrop and storm for your cows through suitable feed; cow testing now asks you to go further, to see if some corner stall in your stable is overlooked, ot dredge the blocked up channel, to dig deeper the water way, the river of your unswerving purpose to keep none but the best cows you can secure, and to know through the medium of clear-cut figures just that this cow or that one is the best, to prove to yourself or any one else just how you know that fact.

"Thanks to the help of dairy records we have men on our register who own herds of 22 cows averaging over 8,000 pounds of milk and 250 pounds of fat; several dairymen in various districts of Ontario, Quebec and the Maritime Provinces have good grade cows giving from 9,009 to 18,000 pounds of milk and from 300 to 500 pounds of fat. They would never have been discovered but for dairy records which impress the seal of satisfaction on dairy work, becoming the safeguard of quality.

Why These Differences?

"69 good cows—Total milk, 608,578 lbs.; value, $6,694.35.

"73 poor cows—Total milk, 391,872; lbs.; value $4,310.59.

"Good herd, 16 cows—Average milk 9,519 lbs.; average fat, 305 lbs.; value $104.70; feed cost per cow, $60; average profit, $3.84.

"Note—Each one in the good herd makes as much net profit as eleven in the poorer.

"Some rather startling contrasts are found in these figures relating to cows in the Listowel district. One lot of 69 pretty good cows gave a total yield of 608,578 lbs. milk; think, one hundred and eight tons more, fifty-five per cent more milk than a lot of 73 poorer cows close by. They earned over twenty-three hundred and eighty dollars more cash.

"Included in the first lot of cows is a herd of 16 with an average yield of a little more than twice as much milk per cow as in the poorer herd of nine. Above the comparatively high feed cost of sixty dollars the average profit is $44.70 per cow, or eleven times as great as the profit per cow in the other herd.

"In order to make one thousand dollars clear profit, the owner of the first herd would need only 23 such good cows, but the second owner would be confronted with the task of handling two hundred and sixty. Phew!

Show Land Fertility

"Herd records not only help to solve some of the problems of commercial dairymen who seek a reduction in the cost of feed per 100 lbs. milk, but show them the increasing fertility of their land as concentrates are judiciously used. (The total value of the essential elements in the manure from 25 cows is computed at over one thousand dollars.

"From milk and feed records sent to the office by farmers we find, for example, that eight cows in one section produce milk at a feed cost of 62 cents per 100 lbs. even when feed is valued at as much as $51 per cow. That seems a better business proposition than giving $36 worth of feed to a cow that makes the feed cost run up to 82 cents per hundred.

"There we have the stamp of efficiency, simply the better way of doing things, keeping eight cows geared up to produce 56,000 lbs. milk instead of the low speed total of 31,000 that a neighbor obtains, each returning a clear profit of 54 cents on each 100 pounds of milk instead of the neighbor's 32 cents. Not merely a two-bagger, records make many an exciting triple pla yon the farm diamond.

"With so much good thought by various leaders being put on the problem of Canaad's future, perhaps we can glean here something of the value of records to our rising generation. Our Dominion, the new laboratory and fusing pot of all nations, needs the sturdy race, not the stunted anaemic of the city tenement, but the choice product of the country's soil drawing from mother earth solid qualities of mind and body.

"Not only is cow testing proving itself congenial to scores of our lads, knotting them by strongest ti s to the home farm, but as it is developing that quality of complete efficiency which perfects the successful dairyman, the cramped mind of youth or adult will stretch its tough-muscles, homes will ring with the joyous laughter of the victor, the conqueror of adverse circumstances, the inspiration has come, to our certain knowledge, from dairy herd records."

Do you want to earn $10 a week or more in your own home?

Reliable persons will be furnished with profitable, all-year-round employment on Auto-Knitting Machines, $10 per week readily earned. We teach you at home, distance is no hindrance. Write for particulars, rates of pay, send 2c. stamp.

The cost of an ALPHA Gas Engine is less than the cost of doing without one

YOU plan to some day have a gas engine. You realize that you need one—that there are many jobs on your farm that could be done quicker, easier and cheaper if you had an engine. Your idea is that it will save money and time, which is also money.

Very true; yet, if an engine will save you money, you ought to use it right now. That is the way to save the money that will pay for the engine. As long as you put off buying one you are losing money that would soon pay for the engine.

It is not a question of how soon you can afford to buy an engine, but how long can you afford to do without one. You surely realize that during your life time you have in one way and another lost the price of several engines, by trying to get along without an engine. Good sense demands that you stop the loss at once.

Ask us for complete information and prices of Alpha Gas Engines. They are made in eleven sizes, 2 to 28 H. P. Each furnished in stationary, semi-portable or portable styles, and with hopper or tank cooled cylinder.

This School Girl Had Bad Fainting Spells

Was Weak and Run Down, But Dr. Chase's Nerve Food Made Complete Cure.

The most critical time in a girl's life comes during the school age, when she is impelled by rivalry to put forth her best efforts in studying for examinations. At the time she should have healthful outdoor exercise and abundance of fresh air, to keep the blood pure and rich, she is confined by her studies. Is it any wonder that she becomes run down in health and suffers from headaches, indigestion, loss of appetite and spells of weakness or fainting?

The case described in this letter is a good illustration ,and you can read here the splendid results of using Dr. Chase's Nerve Food to help through this critical period.

Mrs. H. Houston, Highland Grove, Ont., writes:

"While attending school my daughter became weak and very much run down. She was frequently troubled with bad fainting spells, and nothing we tried seemed to do her any good. We were advised to try Dr Chase's Nerve Food and did so with most satisfactory results. I am pleased to tell you that after using five boxes of the Nerve Food she was completely cured, and has no return of the fainting spells."

This statement is certified to by Mr. Hamilton Houston, Justice of the Peace.

The reason Dr. Chase's Nerve Food is so effective in cases of this kind is because of its extraordinary blood-forming influence. By creating an abundance of rich, red blood it sterngthens the action of the heart, revitalizes the exhausted nerves and builds up the system in every way.

The apptite is restored, digestion improves, you rest and sleep well, and the new vigor and energy is felt in every organ of the human body. Dr. Chase's Nerve Food is doing wonders for men, women and children whose systems have become weak and run down. 50 cents a box, 6 for $2.50, all dealers or Edmanson, Bates & Co., Limited, Toronto.

LIVE STOCK.

Urethral Calculi in Sheep.

Every spring and early summer complaints are rife of considerable losses among sheep and lambs in process of fattening for the butcher from what, in different districts, is described as "water braxy," "water stoppage," "water drop," bladder disease, etc. The sheep affected are invariably whethers or rams receiving a rather large supply of highly nitrogenous food and especially such as are getting mangels—hence the great frequency of the disease at the time of year mentioned as compared with other seasons. Only the unfortunate farmer whose swedes have failed (unless he be thriftless and shiftless) commences his mangels until well on in the spring.

Technically the disease from which the sheep die is cystitis, or inflammation of the bladder, but different kinds of calculi are almost invariably the cause of urinary disorders in sheep, and they are primarily responsible in these cases of bladder disease. What is commonly described as disease of the bladder in fattening wether sheep and lambs is not, in the first instance, an affection of the bladder at all—the bladder being only affected by the mechanical impediment offered to the evacuation of its contents through the natural channel, which is the uretha.

Calculi, when formed in the kidneys, and found in the ureters, where they are not uncommon, though they rarely give rise to noticeable symptoms, and have but little pathological importance, are termed renal calculi. When formed in the bladder they are named cystic calculi; in the uretha, utethral calculi; and when abundant around the sheath or wool at the opening of the urinary passage, or more correctly at the outlet from the bladder, they are termed preputial calculi. Very often the obstruction is not due to "stones" in the ordinary acceptation of the term, but to collections of gravel or sandy matter or the formation of crystals in and around the uretha, which check, or stop, the flow of urine, and so cause inflammation of the bladder. The reason why male sheep are affected is owing to the peculiar construction of the uretha; the presence of the singular structure known as the "worm," or appendix vermiformis, and the extreme smallness of the urethal outlet, favors the accumulation of calcareous deposits, which, in other animals would pass away readily enough. In the ewe, as in other females, the urethal canal is very short and direct and of much larger calibre, and wider at the opening, than the male uretha.

The Use of Roots

In all probability is it often a combination of several articles of diet rather than one in particular, that is in fault, but there is a general agreement in associating the disease with the use of saccharine roots, and especially ripe mangels, in combination with forced feeding on highly albuminous foods, such as beans, peas, barley and wheat. Want of exercise, and total abstinence from water, are also regarded as conditions tending to favor the deposit and accumulation of gravel which chokes up the urethal canal. While the necessity for the rapid production of mutton for the butcher exists, along with the use of sheep as manure distribtuors, the foods mentioned will continue to be used for feeding sheep, but when losses are occurring from cystritis a temporary change of diet and exercise on pasture for the remainder of the flock is indicated.

Treatment

Small calculi forming on the wool of the abdomen, and causing partial obstruction to the flow of urine, should be snipped off. Where the orifice is choked with gravel it may often be removed by careful manipulation, but when, as frequently happens, the phosphatic material is deposited in the uretha for some distance up, or a small calculus is present, there is nothing for it but an operation for its removal. Where no relief is afforded the symptoms become more and more urgent. As a result of the retention of urine in the bladder it becomes inflamed, the inflammation extends to the kidneys, and, in some cases, the bladder is ruptured. Death results from uraemia, the blood and solid tissues becoming impregnated with the kidney excretion. Fomentations, lubrication by the injection of carbolized oil, and the internal administration of belladonna, are recommended to assit in clearing the urethal passage, because it relaxes involuntary muscles. A cathartic, followed by diuretic agents and change of diet, are indicated. With inflammation established recovery is practically hopeless, and if relief from the obstruction cannot be given it is wise to slaughter the animal before fever and uraemia sets in, because then the blood becomes loaded with impurities and the carcase quite unfit for human food. The liability of the rest of the flock to the same condition should not be overlooked.—Veteran.

Breeders Should Now Raise All Stock Possible.

Owing to the heavy drain upon the live stock of the various warring nations of Europe, they have been forced to go abroad for supplies. The longer the war lasts the greater will be this demand. Moreover, when peace is restored these countries will require large number of the various classes of animals to replenish their studs, herds and flocks. It should be borne in mind, however, that the buyers, who come to this country after the war, will require better animals than have been bought during war time, as they will be used largely for breeding purposes.

With this end in view, the best of the females and particularly the young stock should be kept for breeding purposes. Breeders should not fail to raise all the live stock possible at this time, in order that the country may be able to supply a large number of the animals that are certain to be needed by the warring countries. At present, however, there is an unequal distribution of live stock in the country. In certain sections there is a heavy surplus, with a corresponding scarcity in other parts. During the past year hundreds of young cattle from our Prairie Provinces have gone to the United States as stockers and feeders. These should have been kept at home, particularly the females. Sections of the West are reported as being in need of good draft horses, particularly draft mares, while, in sections of Ontario, there is an over supply of this particular class.

In order to remedy these conditions, the Minister of Agriculture, through the Live Stock Branch, has decided to grant liberal aid to breeders who wish to secure good breeding stock. The conditions under which aid will be given are as follows:

In the event of a number of farmers in any district of Canada wishing to cooperate for the purchase of breeding stock in carload lots from some distant section of the country, the department will pay the travelling expenses of their duly appointed representative during the time required to effect the purchase and transport the shipment to its destination.

Should it be desired, the live stock commissioner will nominate a suitable person who will be directed to accompany this representative and assist him as far as possible in buying and shipping the animals.

Persons wishing to take advantage of this offer should make full arrangements with the Live Stock Commissioner as to place and time of purchase before sending out their representative.

Choice of a Bull.

When will dairymen practice the belief which they hold that the bull is half the herd? Nearly everyone believes this, yet very few take such care of the bull as to get out of him all that he is capable of producing or transmitting. It is ont enough to say that your bull is a purebred, and that he came from such and such a herd. There are poor purebreds, and they have been used very largely because they were cheap, and they have been the cause of degeneration rather than improvement of the herd. If breeders and dairymen would only realize how thoroughly in the course of years the blood and characteristics of the bull impregnate and dominate any herd where he is used, there would be more care in selection. Let me make a selection first of all to those who are not raising purebred herds, but are rather in the dairying business for the profit of the cows, either at the pail or churn. Use none but a purebred bull. Remember that the bull should impress upon his get either his own likeness or the likeness of an ancestor, but unless a bull be extraordinarily prepotent, he more often impresses on his offspring a likeness of a remote ancestor rather than any fixed characteristic from himself. Therefore, in using any bull, it does not follow that his daughters will have the characteristics of his dam—the chances are that the progeny will resemble more closely in appearance and characteristics a more remote ancester than the dam of the

bull. Consequently it follows that if there be any impure blood in the sire used, there is a chance that his progeny may partake of the impure characteristics, and that he will not impress upon his offspring the desired qualities to the same extent as if he were pure. If you seek to produce milk, and milk only, without regard to what is contained in it, use a bull of a breed whose characteristics is ot give a large flow of milk, but let it be one of the milking breeds. If you are seeking to produce animals for the butcher's bolck, breed from a pure bull of one of the beef breeds. To those who are seeking to breed cows for the dairy, whether they be purebred or whether they be crossbred, I would say, remember the adage that "like produces like or the likeness of an ancestor." See that the dam of the bull you propose to use has the characteristics in either milk giving or butter making, and in form and size of udder, that you desire to see perpetuated in your herd, that his granddams were possessed of like characteristics, and so back, if possible, to at least four generations. If the female ancestors be possessed of those characteristics you seek to have established in your herd, then you may be reasonably assured that the bull will, when mated properly with desirable cows, produce staisfactory offspring. To those using what is known as an "in-bred" sire, that is, one inbred to a common ancestor on the part of both sire and dam, bear in mind that while the bull so in-bred will probably have the ability to fix the characteristics of the common ancestor to whom he is in-bred, he will, as surely fix and exaggerate the undesirable features of the ancestor as he will desirable ones. Therefore, it is especially necessary to see that the ancestor to whom he is in-bred, or his descendants through whom your bull traces to him, be not possessed of characteristics that you do not desire to perpetuate in your cows. To those breeders of pure-bred stock who are not financially in a position to go outside their own herds for desirable sires, I would suggest that they mate the sire they have in use to their very best cow; that they retain her son; that they mate him with the next best cow not related to the dam; and so on until they produce themselves a sire which has, as female ancestors for four generations back, desirable cows. In this way they are pretty sure to have a bull that will produce in his offspring the sought-for qualities, provided the cows to which he is bred be themselves desirable.

But it will be quicker and probably cheaper in the long run to buy a good, well selected sire if the one in use is not really good.

With good health at your back you can do anything.

How Long Should a Cow be Kept.

Many dairymen and others who milk cows for profit believe that when a cow reaches the age of seven or eight her useful years are over, and that she should be replaced by one younger. But, other things being equal, this is a mistake. A cow that has been well cared for, with generous rations and proper attention given to her comfort through all seasons of the year, is better and will make a more profitable return at eight years old than at any earlier age; in other words, she is in her prime, and she will continue in this condition several years, and will not be considered an old cow until 14 or 15 years have passed. Cows with first calves—at two or three years—are generally unprofitable in their milk yield, and one really good cow between seven and eight years old will pay a better revenue than two that are performing their first year's duties in the dairy herd, and she will probably consume but little more food than one of the younger ones. The fact is worthy of the consideration of those who are dairying for profit. A prudent dairyman who manages well knows which are his best cows; these he will not sell, under ordinary circumstances, as long as he continues in the business. It is, therefore, wise in buying a cow to investigate well the reason for selling. It is highly essential that a dairy cow, to be profitable, should be a hearty eater, for just in proportion to her ability to consume and assimilate food will she make returns to her owner for his care and attention. This valuable feature can generally be determined very early in the animal's life. A calf with a dainty appetite is almost sure to retain this undesirable quality after she becomes a cow, while one with a rugged constitution and greedy, always wanting more, becomes the cow with power to consume food largely, and if bred and constructed for dairy work, this is the kind that will pay largest returns. These observations are more applicable to Jersey cattle than to Shorthorns, whose value as barrens is an important item of consideration each season. It holds true, however, that a really good milch cow may be used profitably many years, and should not be sacrificed to the butcher when young.—T., Suffolk.

The milk in the pail the cow kicks over is lost forever

AND the butter-fat that goes into the can through the skim-milk spout of a cheap, inferior or worn-out cream separator is just as surely lost as the milk in the pail the cow kicked over. If you are trying to get along without a cream separator, or with an inferior or worn-out machine, you are losing butter-fat right along and butter-fat is money.

Get Your DE LAVAL Now—Right Away

every day you use it it will be paying for itself out of its own saving.

If you haven't the spare cash right now that need not hinder your immediate purchase.

We have an arrangement with De Laval agents which makes it possible for any reputable farmer to secure a De Laval on the partial payment plan—a small payment at time of purchase and the balance in several installments, so that a De Laval really pays for itself while you are using it and getting the benefit from it.

Let the De Laval start saving cream for you right now while butter and cream prices are highest. See the nearest De Laval agent at once, or if you do not know him, write us direct for any desired information.

On account of the high commercial value of the oil flaxseed is not extensively used as cow feed. It contains a considerable quantity of protein, with an excess of oil, but very little starch. Steeped until it forms a gelatinous mass, it is of great value as a food for calves on skim milk. It may be used as above either whole or ground. Mixed in small proportions along with coarse grains and ground it adds greatly to the palatability and wholesomeness of the meal ration. It should very seldom constitute more than one-fifth of the grain ration and one-tenth is usually an effective portion.

Had Dyspepsia.

Says: HE NEARLY TURNED UP HIS TOES.

Burdock Blood Bitters CURED HIM.

Mr. H. N. Manderson, Stettler, Alta., writes: "About twenty-five years ago, in the Province of Quebec, I came pretty near turning up my toes with dyspepsia. A cousin of mine persuaded me to try Burdock Blood Bitters. In about two weeks I could eat anything from raw fat pork to unleavened bread. Three bottles did the job, and I have never been troubled with my stomach since. You would say that this is wonderful if you could only see what we sometimes have to live on in this country; bannock, half cooked beans, etc."

Burdock Blood Bitters has been on the market for the past forty years, and cannot be excelled as a medicine for all diseases or disorders of the stomach.

B.B.B. is manufactured only by The T Milburn Co., Limited, Toronto, Ont.

THE HORSE

Wintering Horses Cheaply.

Years ago I learned through circumstances I could not avoid that horses, especially idle ones, are fed and pampered more than is good for them during the winter months. Even the work horses often are overfed and their digestive systems thus impaired till they forfeit considerable of their strength an denduring qualities. We had bought a piece of practically unimproved land. There was nothing on it except a good well, corn crib, and rough stable and hay barn. A new house had to be built, and while it was in course of construction the severest part of winter came on. There were practically no lots for hogs around the barn, so the dozen or more frisky Duroc-Jerseys were nailed up in the old barn, while the house was being built. It was during this unsettled state of affairs that the first snow struck us, covering the ground to a depth of 5 inches. We managed to slip the milk cows into one end of the old barn, ont of the cold and snow, but there was onthing else for it but that the horses should hump up on the leeward side of the building, out of the wind, but getting their backs covered with snow.

Up till the time of the snowfall, the horses, which were idle most of the time while the house was going up, had some cornstalk pasture and a few acres of bluegrass to range on. They did not receive one bite of grain or stored roughage, because their owner did not have it to feed. The snow of course covered up most of the grass, and I began to wonder what was to be done for feed. With enough cash perhaps to buy a good bale or two of hay, and only a few shocks of old fodder up over head in the barn, the outlook did not look especially dazzling. The horses got to pawing around some grass spots in a small patch of timber on the back of the farm, and it seemed as though they were doing all right; although I have looked off the house-roof, where my fingers got mighty cool in handling frozen nails before driving them and wondered whether I ever should get just punishment for making those poor animals rustle their feed out of the snow.

But the horses did not seem to care for the unhandy method of pawing the snow off the ground, and using their teeth as ice-tongs in sucuring their grass. There was a sheltering bank out in that patch of woods and those horses would sleep behind that of a night, rising and going after their grazing early. In fact, they rarely ever came to the house for water, and when they did it was drink and gallop back to the field and pasture. I kept a close watch of the animals, fully expecting a great fallingoff in their flesh, but it never came. Even the colt in the bunch did not fall off, as one would have expected, but if it had I would not have known where to put it—at least till one room was ready for occupancy in the new house. I might have stored him there. At last, when I saw that I would not have to stop and lose the time to bury that bunch of horses, I became convinced that they were doing about as well as I ever had them to do, so I let the horses do the worrying, if there was any, and went ahead and finished the house.

In the meantime I made use of the old fodder overhead in the barn by feeding it out to the horses, and by the time it was gone I had a very little feed to buy. The horses all came through the winter in fair shape, and those which were young, made a fine growth the following season. Of course, a horse that has "roughed it" more or less throughout the winter months will not show up as well when spring comes as those which have been carefully housed, pampered and fed heavily. This is one of the points which accounts for the vigor and activity of the free-range horses. Their coats of hair grow long and thick through constant exposure to the severe cold, and this affords good protection from the rigors of winter; while the daily exercise promotes ideal digestion, good health, and the development of a rugged constitution in general.

Since the foregoing experience I always have wintered all the idle and stock horses right out in the open, merely providing a sheltered place for them to slip into, out of cold rains, sleets and snow, and I would not think of trying any other method. Only last winter some mule colts on our farm ranged right outdoors, and a huskier pair I never raised. I venture the statement that those colts were not under shelter a dozen times all wir ter, unless it was storming. Apart from their grazing they had good, bright cornfodder and kafir, with a light feed of corn. It may be added that generous feeding of grain will be found highly beneficial for range norses, especially colts, provided one has plenty of it and it is not too high in price.—Iowa Farmer in Breeders' Gazette.

When you buy a Horse.

When one purchases a horse warranted sound, what is the legal interpretation of the word "sound"? An old English judge, in writing an opinion on the subject, said: "I have always considered that a man who buys a horse warranted sound must be taken as buying him for imemdiate use, and has a right to expect one capable for that use, and of being put to any fair work the owner chooses.

"The rule as to unsoundness is that disease or accident, undergone any alif at the tiem of the sale the horse has any disease which either does diminish the natural usefulness of the animal; or, if the horse has, either from disease or accident, undergone any alteration of structure that actually does at the time, or in its ordinary effects, will diminish the natural usefulness of the horse, such horse is unsound."

The foregoing opinion expresses the sentiment of the law in this country on the subject. In every transaction where the sale and warranty of horses is concerned the courts will look into the individual transaction and try to ascertain the intent of the parties and the agreement as made between them.

An Actual Case

There is an interesting case on record where a horse breeder sold an animal and delivered with it the following written instrument: "Office of O, Importer of Horses. Horses constantly on hand. Every animal guaranteed a breeder. Sold this day to J. a horse and if it does not give satisfaction, it may be exchanged for another."

The court in construing this instrument held that the wararnty was that the horse was an average breeder, although nothing special had been said, the statement merely appearing on the letterhead of the importer and breeder.

The law merely assumes to protect the purchaser in these cases against fraud and deceit. The old time horse trader with his ability to "skin" all who dealt with him finds no sympathy in court. A horse must be absolutely sound, or the law will attach the liability to the seller in every instance where warranty to that effect has been made.—Chesla C. Sherlock.

Points of a Horse.

A subscriber asks for color, average weight and height of the several breeds of horses. Percherons were formerly mostly grays, but now black is very popular, and bays, roans and an occasional chestnut are seen. Percherons stand from 16 to 17.2 hands high and weigh from 1600 to 2200 pounds and more.

Clydesdales are mostly brown, bay and black, 16 to 17 hands high and weigh from 1600 to 2200 pounds. Belgians run largely to roan, black and bay in color, and Shires bay, brown, black and gray. Belgians are 15.3 to 17 hands high and weigh from 1700 to 2500 pounds, while Shires stand 16.2 to 17.2 hands high and weigh from 1700 pounds up.

Morgans are purely an American breed and are largely bays and browns and 15 hands is perhaps a fair average height. American saddle horses stand about 15.2 hands high and are

Eat more Bread and Better Bread

Few of us eat enough of the "Staff of Life."

Make your Bread from

723

brown, black and chestnut in color for the most part.

The Cleveland Bay horse is either a light or dark bay, with black legs, 16 to 16.2 hands high and weighs from 1000 to 1300 pounds. The German coach horse is slightly smaller, standing 15.2 to 16 hands, weighing from 1000 to 1200 pounds and bay or brown in color.

The Thoroughbred horse is usually brown, bay and chestnut, with white points. The Hackney is brown, bay, roan and chestnut, 14.2 to 16 hands high. Shetland ponies may be any horse color, spotted ones being popular. They are from 36 to 42 inches high and weigh from 275 to 500 pounds.

Signs of Foaling.

Beginning enlargement of the milk glands is the earliest sign of foaling, but markedly variable as to time, dependent on the individual and certain physiological phenomena not always clearly apparent. However,, when this evidence appears the bag gradually enlarges, becoming tense with secretion and newly-distended blood-vessels. If we are dealing with a plainly pregnant mare, this sign warns us of approaching foaling. This incipient milk gland activity is usually manifest earlier in mares with the first foal than in matrons of the stud. However, as foaling time approaches milk secretion may become so profuse as to occasion its dripping from the teats or escaping in a stream.

These symptoms, together with an apparent change of mental attitude in the mare, lead the observer to watch for those manifestations denoting rapidly-impending foaling. When one observes the so-called formation of wax on the ends of the teats, he then has good reason to expect a foal in from 24 to 48 hours, although this phenomenon is not by any means invariable and foaling may be delayed after full formation of teat wax for several days —in my experience as long as nine days.

The really weighty evidence of foaling within a day or two is the loosening of the pelvic ligiments, particularly those at the base of the tail, which allow the muscles covering them to depress and bringing about a sinking-in of the croup. At the same time the lips of the external parts become slightly swollen, congested, bluish in color on the inner aspect, stand apart, a trifle flaccid, and from the orifice issues more or less secretion.

Following or accompanying these signs, a decided change of mental attitude in the mare is quite evident. As the event approaches the mare gives evidence of uneasiness, her feeding is interrupted, fugative pains due to womb contractions are manifest, and the countenance plainly denotes anxiety. If the mare is at liberty, she will usually withdraw from her companions and seek a quiet spot in which to foal.

Foaling

Under normal conditions foaling is accomplished rapidly and with but slight discomfort to the mare. Should any delay occur, though covering a few hours only, a dead foal is inevitable. This disaster is due to the fact that the mare's afterbirth is loosely attached to the womb, and frequently becomes detached early during parturition, thus cutting off the foal's blood supply and necessary oxygen.

Many foals are unnecessarily sacrificed during the act of foaling from lack of knowledge on the part of the breeder as to easily-acquired physiological facts and manual manipulations simple in application, and quite possible for the ordinary breeder to employ at the beginning of foaling. The breeder should acquaint himself with the normal foetal positions, so that he may correctly determine whether or not the foal is coming properly. Such examination should be made immediately on the advent of labor signs, since delay beyond a reasonable period of time certainly presages a dead foal, and not infrequently a dead mare also. Such knowledge on the part of an owner will stimulate the early summuns of a veterinarian, who in all probability will be able to save both foal and mare. There is no logical explanation of the great variability in the duration of pregnancy of the mare, although many hypotheses have been advanced, none of which can be accepted by the thoughtful investigator. Thirty years of fairly wide experience among the large breeding ranches have convinced me that the duration of pregnancy in the mare is a pure idiosyncarsy, depending solely upon individual physiological entity.—"Breeders' Gazette."

WHY NOT MAKE MONEY ?

You have it in your power to do so. Money capital is not needed. A business training will point out to you the way, will give you the confidence to put your plan into action. Three years from today you can own a business of your own that will bring you rich returns for your efforts. You can be financially independent.

It will pay you to attend the

"Monday Morning Leg."

Lymphangitis, or "Monday morning leg," is a malady to which some horses are more prone than others, but the simplest method of prevention in all cases is to decrease the quantity of food allowed on Sundays and other rest days, instead of giving more, and especially in the case of animals that are predisposed to lymphangitis by breed or constitutional tendency. No horse standing idle in the stable should have as much food as when engaged in hard work. It is not necessary, and therefore it is most wasteful. In cases where the animal has been heavily corn-fed, the best way to cut short an attack is to give a full dose of physic—physic meaning an aloetic ball—but when green meat is the staple diet it is better to give linseed oil. The following is a good drench: Oil of turpentine, 3 oz.; sweet spirits of ntire, 1 oz.; linseed oil, 1 pint. This may be repeated in six hours. The enlarged limb should be freely and frequently fomented—fomented, not padded about with a piece of old sacking and half a gallon of lukewarm water—and afterwards dressed with a lotion of acetate of lead and sulphate of zinc, of each ½-oz.; water, 1½ pint. There are differences of opinion as to whether the horse should be exercised or not. Some affirm that it disposes to elephantiasis, but our opinion is that it is useful to move the animal about, and that movement helps to clear up the effusion. Movement is painful at first, and the animal can hardly put the foot to the ground, but in a short time the lameness becomes markedly less, and the swelling reduced in volume. If there appears a tendency for the swelling to persist after the lameness has become less or disappeared, the animal should be given a course of combined tonic and diuretic medicine, receive food that is light and easy of digestion, have regular work or exercise, and the limb should well be hand-rubbed at frequent intervals, and regularly bandaged while standing in the stable. A suitable ball for swelled leg, after the active inflammation has subsided, is:—Sulphate of copper, chlorate of potash, and powdered gentian, of each 1 drachm; powdered nux vomica, 20 grains; powdered resin and nitrate of potash, of each 1½ drachm; soap and Venice turpentine to form a ball. One of these should be given every night for a fortnight.—Veteran.

A "365" Day Liniment

YOU ARE SAYING TO YOURSELF—"If I only knew of something to stop that Backache—help my Rheumatism—cure my Neuralgia, I would send and get it at once."

Get It. Gombault's Caustic Balsam will give you immediate *Relief.* A Marvelous Human Flesh Healer and a never failing remedy for every known pain that can be relieved or cured by external applications. Thousands testify to the wonderful healing and curing powers of this great French Remedy. A Liniment that will soothe, heal and cure your every day pains, wounds and bruises.

Gombault's Caustic Balsam
The Great French Remedy Will Do It

It Helps Nature to Heal and Cure. Penetrates, acts quickly, yet is perfectly harmless. Kills all Germs and prevents Blood Poison. Nothing so good known as an application for Sores, Wounds, Felons, Exterior Cancers, Burns, Carbuncles and Swellings.

"I had a bad hand with four running sores on it. The more I doctored the worse it got. I used Caustic Balsam and never needed a doctor after that." —Ed. Rosenburg, St. Ansgat, Ia.

Mrs. James McKenzie, Edina, Mo., says: "Just ten applications of Caustic Balsam relieved me of goitre. My husband also cured eczema with it, and we use it for corns, bunions, colds, sore throat and pain in the chest."

A Safe, Reliable Remedy for Sore Throat, Chest Cold, Backache, Neuralgia, Sprains, Rheumatism and Stiff Joints. Whenever and wherever a Liniment is needed Caustic Balsam has no Equal.

Dr. Higley, Whitewater, Wis., writes: "I have been using Caustic Balsam for ten years for different ailments. It has never failed me yet."

A liniment that not only heals and cures Human Flesh, but for years the accepted Standard veterinary remedy of the world.

Price, $1.50 per bottle at all Druggists or sent by us express prepaid. Write for Free Booklet and read what others say.

THE LAWRENCE WILLIAMS CO., Cleveland, Ohio

Heaves of Horses.

Heaves is a very common and annoying disease of horses, interfering seriously with the usefulness of the animal, and consequently detracting from its value. Mainly a disease of old horses, it is essentially the result of faulty feeding and working, especially hard pulling or fast driving when the stomach is overloaded. Gross feeders are frequetnly subject to heaves.

While in old, established cases there may be alterations in structure of the heart and stomach, the principal changes are observed in the lungs. These consist first in an enlargement of the capacity of the air cells through dilation of their walls, followed by a passage of the air into the lung tissue between the air cells. Owing to such structural changes it is impossible to prevent progressive development of the disease, which, however, under proper care, may go on slowly, the animal remaining serviceable for certain kinds of work for years.

Except in the very early stages the disease is readily detected. The symptoms are those which would naturally be manifested in a condition where the lungs are involved. A peculiar short, grunt-like cough is usually present, and when the animal is exerted a wheezing noise accompanies the breathing. The principal and characteristic symptom, however, is the jerky or double movement of the abdomen in an effort to force air from the lungs. The air passes into them freely, but the power to expel it is lost to a great extent; therefore the abdomenal muscles are brought into play.

Depraved Appetite

Indigestion is frequently observed in these cases, and the horse may have a depraved appetite, as shown by a desire to eat dirt and soiled bedding, and there is a tendency to the condition commonly termed "pot-bellied." The animal, though a heavy feeder, becomes unthrifty and emaciated.

A poorly vetnilated stable, humid weather, severe work, and overfeeding with coarse, dry feeds tend to aggravate the trouble.

As in this condition structural changes have taken place in the lungs, teratment, as a rule can only be directed to the relief of the symptoms, and it is not possible to effect a complete cure after the disease is established.

In the case of an affected horse it will be an advantage to dampen the food with a mixture of one part of molasses to three parts of water, so that no dust may arise while the animal is eating. It is also desirable to restrict the amount of hay or forage, as large quantities of bulky feed which distend the abdomen increase the difficulty, and an animal with heaves should never be driven or worked when full of such material.

In these cases Fowler's solution of arsenic may be given in doses of 1 ounce in the drinking water three times daily. Ordinary lime dissolved in drinking water (limewater) will be found beneficial. Lime may be added to a barrel or cask of water, and after the resulting mixture has become clear through precipitation of undissolved portion of the lime, the limewater may be used freely in watering the animal.

POULTRY

Features to Remedy.

(By M. A. Jull, Macdonald College, in Canadian Poultry Review.)

There seems to be the general impression on the part of the public that the poultry industry is something different from other allied industries of agriculture. There are thousands of uninformed people who apparently take it for granted that money can be made out of the poultry industry when all other means have failed. It is difficult to attempt an explanation of the underlying current of opinion responsible for this state of affairs. There are a few conditions, however, which are suggested, and the consideration of these will enable us to secure a better grasp of the real situation of the poultry industry.

The poultry industry of Canada is made up of very many small parts, i.e., the bulk of the eggs and dressed poultry produced comes from the flocks kept on the farms. These flocks are comparatively small in number, and, when considered by themselves do not appear to have a very great influence upon the total production. This is one point which is not given enough consideration and it should always be borne in mind that the backbone of the poultry industry is the farm flock, consequently and improvement must largely result from the improvement of poultry-keeping methods on the farm.

Poultry raising is easily adapted to moderate means. A small beginning can be made at comparatively little cost and good profits can be secured in a small way. This seems to be one of the alluring features of the industry. People seem to imagine that if a profit of $2.00 to $3.00 per bird can be made with a flock of 50 or 100 birds, then the same relative profits should be made when 2,000 or 3,000 birds are kept, but, this is not so. This feature, however, has led to a speculative tendency in poultry raising. Living examples of speculation in poultry raising are to be found in various idle poultry farms throughout the country. In some cases, wealthy business men have established large poultry farms which soon became absolute failures. The principle cause of failure is ignorance, and, in poultry raising, it is especially true, that "a little learning is a dangerous thing."

More Knowledge.

It is very obvious that one of the greatest needs of the times is dissemination of reliable information throughout all parts of the country. In order to provide the public with information which shall be of greatest service, much investigational and experimental work must be undertaken. The public must be informed regarding the most profitable means of poultry production. It is true, that a certain amount of poultry literature is being distributed about the country, but there is a need of more literature, and it should be more widely distributed. In this connection experiment stations and colleges should assume the responsibility of informing the public, and this they cannot do without more work being done in connection with the various poultry establishments. Investigations must be undertaken and experiments must be conducted in order to determine the best methods for poultry producers to follow. At present there is too much haphazard work being done and the results are not what they should be.

A More Stable Industry.

When reliable results are secured from experiments in connection with the various phases of poultry production, then better methods will be adopted and larger profits will result to the producer. If we consider the phase of production alone, we realize that there is an excessive wastage. Consider for instance, the number of infertile eggs produced during the breeding season; the number of fully formed dead chicks in the shell; the number of chicks which hatch but do not grow to a profitable size, and, consider also, the large number of chicks which are matured but which bring little profit to the producer. Every one of the phases mentioned above need to be greatly improved before our industry will be placed on a sound basis. What we need, is rock-bottom for future development. A better class of stock, and improved breeding methods wil overcome much of the wastage at present experienced. It is the writer's opinion, that constitutional vigor, more than anything else, means success or failure in the poultry business. Of coruse, there are many other phases regarding production which affect results, but these cannot be discussed here. There is the question of size of flock, soil contamination and many other factors which must be given proper attention. There are one or two other matters, however, which should be mentioned and which deserve the consideration of everyone who is interested in poultry keeping. Take for instance, our present methods of marketing poultry products. Trade conditions are so complicated that it is safe to say that a great majority of the consumers living in the large cities, do not know what a fresh egg tastes like. This is one of the distressing features of the poultry industry and it seems very peculiar that it should take the average egg produced in the country from two to four weeks to reach the consumer in the city. With the adoption of egg standards, however, there should follow improvement in marketing conditions. This should result in the improvement of the quality of eggs marketed, greater demand on the part of consumers and higher prices to producers. The marketing problem, however, is a very complicated one, involving co-operation, which cannot be discussed at the present time. It is merely mentioned here to impress upon the readers one undesirable feature in connection with our poultry industry.

Another serious condition which reflects on poultry-breeding work is the manner in which some poultry breeders sell live birds. Instances are related where the grossest mis-representation has been made and where stock has been sold which did not possess the qualities accredited to it. This feature is very apparent in the United tSates where the industry has developed to such enormous proportions. The perusal of almost any American poultry periodical will reveal the unjust and unfair methods adopted by certain poultry breeders in disposing of their stock. It is to be hoped that this undesirable feature will soon be eliminated from the poultry breeding industry of Canada.

In conjunction with the matter mentioned above, may be mentioned the kind and nature of advertisements adopted by many poultry breeders. This applies particularly to claims made for egg production in stock offered for sale. It is quite obvious that many of the claims are not only misleading, but are absolutely incorrect. This is clearly a matter of fair play and fair business, and, it is hoped that as time goes on, false advertising will disappear from our poultry periodicals.

There is yet another matter which should be mentioned here, if for no other reason than to serve as a guide post. For many years, many "Systems" have been adopted and applied to various phases of poultry production. Some of these have been termed "Secret Systems" for which great claims have been made. It is true that some of these "Systems" possess certain merits, but it is also true that a large number of these so-called "Systems" are void of all merit, and, moreover they have done much harm to the proper development of the poultry industry. The writer is reminded of a good suggestion, given some time ago, by the Editor of the Review to the effect that what we need in the poultry business is "system" and not "Systems."

Lastly, the questions of standards might well receive our consideration. You are familiar with the standard qualifications of the various breeds of poultry, and you also know what effect breeding for feathers exclusively has upon either egg and meat production. No criticism is offered to the adoption of standards, or breeding to standard, as long as it does not seriously affect utilitarian values. Sometimes, however, breeding for feathers has been carried to the extreme, and egg production has been affected. Consider for one moment, the effect of double mating on egg production. The writer appreciates the necessity for double mating to produce standard males and females, but, the point in question is, the effect which such a method has on practical methods. It is practically obvious to everyone that highest quality Barred Plymouth Rocks cannot be produced for exhibition purposes and for egg production at the same time. The writer considers this matter from the commercial standpoint and no mention would be made of double mating if it did not affect the commercial poultry industry and the breeder of exhibition birds realizes that the extensive development of the commercial poultry industry is of greatest benefit to the breeder of standard bred fowls.

Recent reports are afloat that rose comb varieties of Plymouth Rocks are to be produced and that single-comb Wyandottes will also appear. It is to be hoped that there is no foundation in such reports that Plymouth Rocks with rose-combs and Wyandottes with single-combs will ever be admitted to the standard. If such varieties were classified as standard varieties, it would only serve to complicate poultry-breeding work.

In this short article, merely a few of the outstanding features which affect poultry production have been mentioned. The writer is not a pessimist but is an optimist regarding the future development of our industry. During recent years the industry has been developing very rapidly, and there is every reason to believe that even greater progress will be made in the future. If some of these undesirable features are eliminated from our industry, then the industry will be placed upon a better working basis and larger profits will be secured by commercial producers and breeders, and greater satisfaction will result all round. From the commercial standpoint the need is felt for a well established farm poultry industry. Practically every farm should have a flock of sufficient size, which when given the best attention, will give the maximum returns. A great future lies before the poultry industry of Canada.

Eggs for Hatching.

Every breeder who has eggs for hatching to sell, should give a binding guarantee. He should at least guarantee eight chicks out of a sitting, or the eggs duplicated at half price. He would not lose anything if he gave a sitting free in exchange for the poor one. He would have a pleased customer, who would probably bring him in considerable business. At least, that customer would be liable to recommend him to others. One dissatisfied customer can do a great deal towards ruining one's reputation.

Eggs, to hatch well, must be produced under sanitary conditions and from healthy parent stock. Therefore, long before the season opens, you get your breeding birds in proper condition. Mate your birds for the best results and sell no eggs until your pens have been mated at least three weeks. Discard all birds from your yards that are not up to standard requirements in every particular.

Never sell cheap eggs for hatching. If the eggs from your stock are not worth at least two dollars per sitting, you had better quit the business. As much care must be taken not to overcharge. Put a fair price on your eggs, but these people who sell eggs for hatching at 75 cents per 13 must have a very poor opinion of the quality of their stock. They must sell eggs to beginners who want something "cheap," but remember that the best is always the cheapest in the end.

Do not ship eggs over five days old. If the eggs are to go any great distance, it is best to ship the eggs the same day that they are laid. Examine each egg carefully before shipping. Try to send eggs of uniform size and color, as that will give your customer a much better opinion of you and your stock. Remove all eggs that are rough, irregular in shape, or spotted. Remember that an egg with just a drop of kerosene oil on it, or a hole the size of a pin head, will have a very poor show of hatching.

Never send out eggs that you are doubtful about. If you think they wouldnt' hatch for you, they certainly won't hatch for you. Many unscrupulous men doctor their eggs before shipping, thus keeping them from hatching. What a combination ensues if they only could hatch. Other breeders advertise eggs from a certain pen of six females. When the figuring up at the end of the week is done, he finds that possibly he has shipped 100 eggs from that pen in the past week. Easy to make money that way, isn't it? These people will be found out some day, but as it has been said that "a sucker is born every minute," they will doubtless reap in a large harvest before their double dealings are discovered.

In packing eggs for hatching, pack them with the greatest care possible. If shippers would give a little more care, time and money to the shipping of eggs for hatching, there would be fewer complaints. It is nearly impossible to pack eggs so that there will be absolutely no breakage. The express companies invariably are to blame for the breakage of eggs entrusted to their care. A law should be passed, making the express companies liable for excessive breakage of

Eureka
Potato Planter
Catalog sent free

The Eureka line of Potato Planters is the largest manufactured. This machine takes only *one* man to operate it. That means less trouble and expense for *you*.
Opens the furrow—drops the seed any distance or depth required—puts on fertilizer (if desired)—covers up—marks for next row. Always accurate and automatic.
It's an easy machine to operate. The steel and malleable iron construction mean lightest possible weight and increased life of machine. Your repair bill will be practically nothing. Plants uniform depth at *all* times because plow is directly under the axle. Dropping mechanism in plain view of driver. Does not injure seed.
We supply planters in three sizes, for one or two rows—with or without Fertilizer Attachment.
For 16 years the Eureka Potato Planter has been successfully used throughout the world.
We also make Eureka Potato Cutters and the Eureka Mulcher and Seeder—a mulcher, smoothing harrow, cultivator, weeder, seeder.
Write today. *Sold by*
FROST & WOOD CO., Ltd., St. John, N. B.
Eureka Mower Co.
Box 745
Utica, N. Y.

eggs. No matter how carefully the box was packed, the agent usually forgets and jams something down on top of the box, thus oftentimes spoiling valuable eggs. All expressmen are not like that, fortunately. Many handle eggs with the greatest care, allowing them to reach their destination safely.

Try to please your customers, even if you do so at a loss to yourself. A pleased customer is any breeder's best advertisement. In any business there are always people who are ready to complain. If the eggs don't hatch well, the breeder, of course, is to blame. Possibly the purchaser remembers that he ran the incubator too high the first week and too low the last week. He may have forgotten to fill the lamp; the regulator may have been wrong. Stop and consider the question carefully before you make a complaint. Put yourself in the other man's place and generally it will be found that he did his part.

If you are selling eggs for hatching, send out none until you are assured that the pens are running a good percentage in fertility. Meet a dissatisfied customer half way; be honorable in your dealings; make no claims you are unable to carry out, and advertise, advertise, and advertise all the time. Some people believe in advertising only during the egg season or when they have stock for sale. To be successful, you must advertise continually. Increase your space possibly during the busy months, but never stop advertising entirely. The man who keeps his name before the public all the time will find customers waiting for him when he is ready to deliver the goods.

Sanitation in Poultry Quarters.

Regardless of the type or construction of the laying house, if the birds are to be kept free from disease and in a vigorous condition, it is necessary to practice careful and thorough sanitation. This work naturally groups itself along three lines, namely:

The droppings should be removed from the dropping board whenever they are wet or give off objectionable odors. When by the use of absorbents, the moisture can be kept from them they are not harmful. It will usually be found most economical to do this cleaning at least twice a week during the winter.

The litter on the floor of the house should be removed and replaced with fresh, clean material whenever it becomes wet, whenever it becomes finely ground and loses its property to hide the grain, whenever it becomes soiled and mixed with a large quantity of droppings. An inch of coarse sand should be kept on the floor, and this covered with straw or shavings to a depth of 4 to 6 inches.

Poultry diseases, especially those of a contagious nature, can be largely prevented by spraying the interior of the house four or five times a year with a complete disinfecting solution. The following is recommended as being very effective: Five quarts cream of lime, one pint of creolin, one quart of kerosene. This mixture should be agitated well and diluted with equal parts of water, and applied with a force pump through a spray nozzle. A thorough application of this solution will accomplish three things much more quickly and easily than if the solution were applied wtih a brush.

First. A good coat of whitewash will be applied thin, well spread and put on with force, into all the cracks and crevices. Second. The creolin will kill any disease germs which may be present in the house. Third, The kerosene will help to kill and drive out all red mites and to a certain extent body lice. The former can be entirely controlled by this formula, and the latter by the use of a good lice powder in connection with the above solution.

Lice and mites are a severe drain on a flock of laying hens if present in any number. Care should be taken not to let them get established. A clean house will mean more congenial surrounding and healthier birds.

PILES CURED at HOME by NEW Absorption Method.

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money but tell others of this offer. Write today to Mrs. M. Summers, Box P. 309 Windsor, Ont.

Give YOUR Home this Added Distinction— YOURSELF
NO need to live in rooms whose dullness crowd you in these stay-in days when beauty such as this can be had so easily.
You'll be surprised how you yourself can make any room more livable, more enjoyable to all, with the lasting charm
PEDLAR'S PERFECT METAL CEILINGS
AND WALLS
will bring it. Take the stately "Colonial" style for instance. Think of giving your most important room the delicacy and distinction that makes the true "Colonial" admired by all. There are designs that represent any Period, and Period styles to go with any room.
Pedlar's Perfect Metal Ceilings and Walls are moulded sharp and clear on steel dies. Made to fit with such accuracy no joints can show or come apart.
There are Pedlar designs that will harmonize with the particular height and size of all rooms in your home. They can be painted any tint or shade, and will last as long as your house—dust proof, vermin proof, fireproof and sanitary.
Bring to your home—NOW—that cheeriness and charm that will make these long dull days in doors seem shorter? Bring to it a lasting beauty you will come to cherish more and more as years go by.
Send us a rough plan of any rooms you wish. Our experts will make you helpful suggestion free of charge.
Shall we send you too the fine Wall and Ceiling Catalogue M. F. showing many of the 2,000 designs and Period styles to select from? Ask us today.

It Takes Some Work But Eggs Mean Money.

In caring for our dwellings we must keep constantly in mind the family comfort, so in caring for the hen house we must keep "Biddy's" comfort in mind if we expect her to repay us. The hen house must be kept dry, drafts avoided and ventilation provided. All droppings should be cleaned away once each week and oftener if the hens are kept in the hen house. If the floor is damp scatter plenty of litter over it. Provide plenty of grit, bran and water. If you have alfalfa scatter some leaves where the hens can get them.

The tidy housekeeper wants things to harmonize and a mixed flock of scrub chickens will not appeal to her. Get purebreds, for aside from their attractiveness, they will pay you in dollars and cents. True, eggs from purebreds will bring no more on the market, but the purebred hens will lay more eggs. And the purebred fowls, eggs and baby chicks will sell for more than the scrubs. For a farm fowl I believe we should have an allpurpose breed. I prefer the Rocks for they are a good table fowl, excellent winter layers, good mothers, and active without being destructive. And they are very beautiful.

If you want some extra early chickens set your hens in a good warm place, then when the chicks come provide a warm coop. You can make it so by lining all around with paper and putting litter in the bottom. I also put old carpet in the coop bottom on every cold nights or days. Yes, it takes lots of work, but it pays.—Minnie Hill.

Egg eating is a bad and expensive habit. but it seems natural for the hen to crave the material needed to form the egg shell. The plan I have successfully followed for years is to scald a mixture of one pint ground oyster shells and eight quarts of any grain mixture I am using at the time. The egg eating stops right away, but as a precaution I gather the eggs frequently for a few days so there will be no temptation to the hens. The plan is little expense and no extra trouble. Many have a box of the ground shells in the yard, so the hens can help themselves. My plan is better because the hen is obliged to take in some of the shells in her food.—A. A.

Where the White Nun Walks.

(Continued from Last Issue.)

That was the sound of a long shrill whistle. For I had drawn the whistle from the pocket of the cloak. In my desperation I had thought that at all costs I must summon help. The girls would be listening. Surely they would understand. And though it might draw discovery upon us—

But it didn't. You know it is not easy to locate the sound of a whistle. Although blown from less than twenty yards from where they stood, the men had no notion from which side it came. Only they understood it to be a note of alarm. They took to their heels and fled. I whistled and whistled and whistled, without a moment's intermission, and I heard their flying feet thudding and blundering.

It was a keeper who first rushed up.

"What's the matter here? Who's whistling?"

"Gregory, there are robbers—they have tried to kill and rob Mr. Talbot. They have hurt him. He is here——"

"After them—after them!" cried the faint voice at my feet. "Don't let them escape. Never mind me—after them!"

Then his voice failed, he seemed to fall back. But now there were sounds and lights approaching down the avenue and from many sides as well. Gregory dashed away calling on his underlings to follow, and I turned to face an excited contingent from the house who rushed upon me ,crying out:

"What is it? What is it? Has anything happened? Have you seen the ghost? Has the White Nun walked?"

"Ghost! White Nun!" I echoed in tones of lofty scorn; "it's Mr. Talbot with the jewels, and he's been shot at and pursued. But he has the jewels safe. I felt them in his pocket," and bending over him again I felt my fingers clutched and guided to the spot where I touched the case bulging in his pocket. But was it my fancy?—or was it some illusion of the senses? For it seemed o me that before my fingers were released they had been saluted by the lips of the wounded man. I thought I heard a whisper:

"I owe my life to you—thank you!"

They were all around him now. Lights were flashing from small electric torches which some of the company possessed and had brought out. I clasped the jewel case in my hands, but I stood aside to let the men get at the wounded messenger. I saw the light flash upon his face, white as death—yet it seemed to be the handsomest and noblest I had ever seen. I have not changed my opinion since! The girls closed round me and carried me off, leaving the men to transport their now unconscious charge to the house. Amongst the assembled guests we had a physician and surgeon both, and not a moment was lost in attending to his hurts. All the rest of us awaited the verdict with the greatest eagerness and excitement. I was made to repeat my story again and again, and it seemed quite clear that some of the daring burglars of the day had scented Tony's errand (they do get wind of things in the most marvelous manner, and the wedding of Eustace was no hole-and-corner affair), and had resolved to possess themselves of the jewels his best man was to bring down. But till Eustace himself appeared we could do little more than surmise how he came to be running down the Nun's Walk with a bullet somewhere in his person; and Judith wrung her hands in mock despair that it was not she who had made herself the heroine of that exciting episode.

When Eustace appeared there was a general rush. He stood up with his back to the fire of logs and told the tale.

"Oh, he'll do all right. Plucky chap as ever stepped. Bullet out and the shoulder dressed and comfortable, and he vows he'll be best man tomorrow whatever the medical authorities choose to say. I believe he will, too! He was with the irregulars in South Africa as quite a lad—laughs at laying up for 'a bit of a scratch and a thimbleful of blood.' We shall see——"

"But ,Eustace, how did it happen? Was he chased? Who shot him?"

"Well, I hope we'll get hold of the gentleman and find that out. What he says is that he must have been shadowed when he left the jewellers though he took every reasonable precaution. What he knows is that as he drove from the junction in his own dog-cart behind a very fast-stepping horse,—his own place is only about ten miles away from the junction in the other direction—he was aware of a small motor-car behind that seemed inclined to rush him—to run into him in fact. Suddenly he had a suspicion, and giving the reins to the groom he swung round and shouted to the men, asking what they were about. Next moment he heard the shot, and knew they were after him and the jewels. He also knew that he was close to the wall of Whiteladies, and that at intervals thehre were gates. He gave his orders to his man. He himself waited a moment and dropped off behind. The cart flew away in the darkness, he made for the gate into the grounds and vaulted over it. All would have been well but for the strong headlight on the motor. Those showed him up to the pursuers. They fired a volley. It was a mercy he was not killed on the spot. He felt the ball in the shoulder, but never paused a moment. Then he heard himself pursued, and flew at top speed towards the house. But he was bleeding fast. The inevitable happened. Though by his fleetness he distanced his pursuers, his strength collapsed, and he fell. If somebody had not been at hand to drag him into the shadows of the yews and cover him up and summon help"—Eustace turned towards me with a smile and a bow, and silent hands made a demonstration of applause—"there would have been tragedy at Whiteladies on the eve of the wedding. Luckily the traditions of Whiteladies live yet, and its daughters can play the heroine's part on emergency still."

Oh, if they only knew what a coward I had been really! But it was nice to be regarded as so brave! And then I had the jewel case to give over to Eustace, and there were the beautiful diamonds to exhibit to us all. Then in the middle came the news that the robbers had been caught! They had trapped themselves behind the walls of Whiteladies, failing to find the gate on their hasty return. They had dodged and doubled and run and hidden for quite a time; but the sporting dogs had scented them out one after the other, and now the police had them safe, and were pertty sure that Scotland Yard would be very glad to have news of them on many counts!

It was late before any of us slept that night, and we were early astir upon the morrow. I don't think I had slept more than an hour or two, for I was hautned by the recollection of that encounter in the yew walk, of the fall of thta tall figure in the light driving coat, of the horror of feeling pursuit coming nearer and nearer. And still my fingers seemed to tingle at the feel of the kiss laid upon them, and even in my dreams I seemed to hear the faint low voice which said: "I owe my life to you—I thank you!"

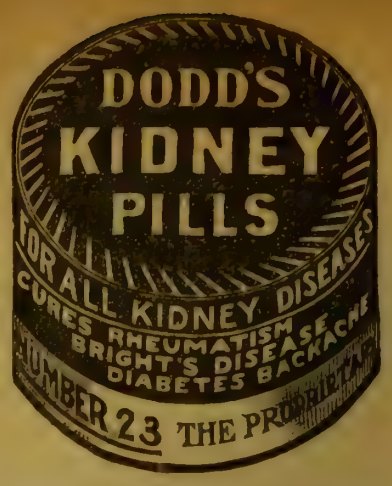
How bright the sun shone upon the wedding morning! How fair looked the bride! How blithe and happy were all faces! For our wounded hero was reported to have slept famously, and to have declared himself "as fit as a fiddle"; I think, until we actually saw him there in the church beside Eustace, his arm in a sling and his face absolutely colorless, though full of interest and animation, we scarcely believed that he would really rise and But hedress and play the part of best man. But he did ,and he and I walked side by side in the procession afterwards; and when they would not let him take a place at the long table, but set him down in a cushioned chair in the oriel, with a smlal table of his own, he looked round with his queer, delightful twisted smile to say, "But how can I cut up my own food? Isn't somebody going to be kind enough to help me?" why then I was simply pushed into a seat beside him, and we had our own little wedding-breakfast there to ourselves. Then when the toasts were drunk there was a special one for "First bridesmaid and best man," and almost directly the wag of the party leaped to him feet and gave—

"To the next wedding at Whiteladies," nad I felt myself getting redder and redder and hotter and hotter, because everybody turned and stared at us in the most barefaced way. And when the awful moment was over Tony got hold of my hand beneath the table, and if he did not kiss it again—it seemed to me exactly as though he had!

Tony stayed a fortnight at Whiteladies after that; and I spent the winter there. And he came over every week and sometimes stopped a night or two.

And now there is to be another wedding very soon at Whiteladies. And the family party is gathering fast, and Judith waltzes me up and down the long galleries, and makes me talk of Tony, which I simply love to do.

"You lucky girl! We all adore Tony! And to think how I have been done out of my chance! If only I had gone that night! I declare I should have been twice as brave as you" (that would not have been saying much, I thought). I should have caught the whole gang single-handed, and simply covered myself with glory! But remember, all you girls, it's my turn now! I'm going to tempt my luck as Maude did. I'm going to be a three-times bridesmaid next week! And don't any of you forget that when the last evening comes, I'm going to be the one to run the gauntlet of the ghost—I'm going to see if there won't be a husband waiting somewhere in the shadows for me in the dark yew tunnel where the White Nun walks!" —The Quiver.



The Dominion Atlantic Company are preparing information for the use of Tourists who may visit Nova Scotia next summer, and this will include a complete list of Hotels and Private houses in Town and Country board. No charge is made to advertise in the railway publications, all hotel and boarding-house proprietors should write at once to the General Passenger Agent at Kentville for the necessary forms on which to furnish such information.

BETTER THAN SPANKING

Spanking does not cure children of bedwetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W. 309, Windsor, Ont., will send free to any mother her successful home treatment, with full instructions. Send no money but write her to-day if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.

HEAT FLASHES, DIZZY, NERVOUS

Mrs. Wynn Tells How Lydia E. Pinkham's Vegetable Compound Helped Her During Change of Life.

Richmond, Va. — "After taking seven bottles of Lydia E. Pinkham's Vegetable Compound I feel like a new woman. I always had a headache during the Change of Life and was also troubled with other bad feelings common at that time—dizzy spells, nervous feelings and heat flashes. Now I am in better health than I ever was and recommend your remedies to all my friends."—Mrs. LENA WYNN, 2812 E. O Street, Richmond, Va.

While Change of Life is a most critical period of a woman's existence, the annoying symptoms which accompany it may be controlled, and normal health restored by the timely use of Lydia E. Pinkham's Vegetable Compound.

Such warning symptoms are a sense of suffocation, hot flashes, headaches, backaches, dread of impending evil, timidity, sounds in the ears, palpitation of the heart, sparks before the eyes, irregularities, constipation, variable appetite, weakness and inquietude, and dizziness.

For these abnormal conditions do not fail to take Lydia E. Pinkham's Vegetable Compound.

The Satisfaction and Profits of Gardening

are just in proportion to the quality of the seeds you plant! If you are ambitious to produce prize-winning vegetables and record crops —or if you simply aim to keep your table supplied with the best—be sure to get

Ewing's Reliable Seeds

Forty-five years of success in amateur and market gardens have proved Ewing's to be sure in germination, vigorous in growth, true to name, and of choicest strains.

The Little Ones in Your Care.

Do You "Overwork" Your Baby?

If your baby is fretful, cries altogether too much, does not keep down his milk as he should and is becoming thin and pale, the chances are very great that you are overworking him.

"Overworking" is a phrase of my own and needs a little explanation. By it I mean that you try to amuse the baby too much, or perhaps you are amusing yourself under the guise of amusing him. The best way to make clear just what I mean is to relate an actual experience—and there are altogether too many of them—which I saw in a home where the pride and joy was a chubby little chap fast being made a wreck.

I had called at the noon hour to attend another member of the family. The farther came in from work and straightway made for baby's crib, where the youngster sat quietly playing with his toes.

"Chick-a-choo, chick-a-choo! How's daddy's big man today!" inquired the father, and with every "chick" and every "choo" he jabbed his finger into baby's ribs. Then he picked him up and toossed him high. Then he hung the poor little thing in the crook of his arm and bored into him with his nose and bristly mustache.

Baby puckered his little face and squirmed and gasped and began to cry.

Later big sister came in from school and proceeded to trot baby on her none too plump knee. Up and down she trotted him, and chanted soemthing about "Ride a gray horse to Danbury Cross." Baby stopped smiling. His breath began to come "ug-ug-ug" with every jounce. The knee hurt him an dhe proceeded to cry again.

And then an aunt played with him for a while, and the hired man came in and tickled baby's feet, and brother danced a paper so close to baby's eyes that he almost looked cross-eyed at it. Mother took him up when the others had got well into their meal and she had a moment. Baby was fretful and hungry, especially hungry, but before feeding him she jounced him up and down, dandled him on her knee, made him "shake a da' da' " to everyone at the table, shaking his tender little arm until his tiny wrist must have ached. By the time she got him well jounced up and thoroughly upset, she proceeded to feed him. It took him five minutes to become quiet, and the milk he took during that five minutes when he was upset did not digest at all. It never does under such circumstances. Father tossed him up again before he left and chucked him in his tiny ribs until he was crying lustily. Grandma came out. She hobbled over to her son and took the baby away from him.

"You won't have any baby if you jounce the daylights out of him all the time!" she exclaimed.

"But he wont' keep quiet," protested the mother.

"Just give him a chance!" said grandma, and she put baby down on the floor on a quilt, up against a pillow. In about ten minutes baby was cooing and looking about and playing with his toes. He was just beginning to get comfortable.

Then I chipped in with this dear, old-fashioned grandmother, and told everyone, from little brother up through the list, that they weer over-working this baby—they were shaking him up inside, actually husting his little legs and arms and ribs, and especially the end of his tiny weak spine, by jouncing him.

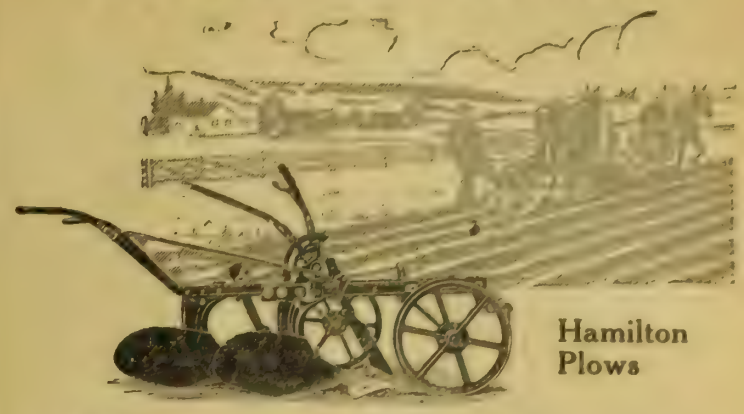
I gave them all a "talking to," and tried to explain just how they were really selfish.

"You call it amusing this baby," I said, "but you love this little chap and you are really amusing yourself by handling him so much and so roughly. If you really love him, give him a chance ot grow. If you have any imagination sit down for a moment and imagine that a great big giant three or four times as tall as any of you came along and tossed you up in the air and jounced you on his knee and poked you in the ribs and snuggled his great hairy face down into your neck, and repeated this about twenty times a day. Just picture this to yourself. That's what is happening to your baby. Give him a chance!" I know they called me a "grouchy old doctor," but it had its good effect. I have told hundreds of other parents the same thing.

You can love your baby without hurting him. Remember, he is very tender, all his bones are mostly gristle, all his internal organs are only partly developed. When you toss him around and shake him up you are doing him a great injury.

Give plenty of food, dry clothes and a clean, cheerful and wel-ventilated room, and baby will sit down on a blanket, braced up against a pillow, or remain in a baby pen and amuse him-

A Great Line of Plows



Hamilton Plows

WHEN you need a plow for turning sod, clay, loam or rocky soil, go to the **Deering** local agent and choose your plow from the **Hamilton** line he handles.

There are two plows in the **Hamilton** line, Nos. 46 and 47 walking gang plows, that every Eastern farmer should know about. They are particularly well adapted for use in such soils as are found north and east of the Great Lakes, and are built to be drawn by two large, or three medium size horses.

The frames are of special construction, which makes the rear bottom as rigid and unyielding as the front one. Wide or narrow bottoms may be used, any change being very simple and easy to make, the adjustments for width and depth of cut give the driver complete control of the work of the plow at all times and make it an easy matter to straighten furrows. The clevis allows half-hole adjustments. Don't fail to see it.

Whether your needs demand a walking or riding plow—gang or sulky, get your plow from the **Hamilton** line, which is handled by the **Deering** local agent. Write us at the nearest branch house and we will send you full information about this great line of **Hamilton Plows.**

self an hour at a time by the very simple means of plucking at his toes and pounding on the blanket with his chubby fist.

Babies keep extremely busy naturally. They have a great many muscles to exercise, a great many joints ot strengthen, and a very great amount of growing to do. Good old mother nature tells them how to do this in the best way. Now when it comes to "coochy-cooing" baby by poking him in the ribs with a finger, or tossing him up in the air, or grabbing hold of his dress at his stomach and playfully shaking him as you would a puppy, you are not amusing him in the least. You are abusing him, overworking him and getting him so that he cannot be left alone a moment.

I do not mean to let the baby entirely alone. It is natural to want to hold the baby, to pat his little hand, to play with his pink little toes, to take him out in your arms for a "walk" in the garden, and these things are all right in their way. It is the overdoing it that makes the trouble. If the right sort of a start is made, if baby is not tossed and mauled about all the time at the beginning, he will amuse himself far better than an adult can amuse him, and he will not cry so long as he is perfectly healthy, has dry clothes and is not hungry.—Dr. A. M. Hughes.

When the Grave Yawned for Him

SANDY GOULETTE TOOK DODD'S KIDNEY PILLS FOR BRIGHT'S DISEASE

Now He Can Do His Day's Work As Well as He Could Ten Years Ago—Offers Proof of His Statement.

Old Fort Bay, Labradore, Que.—February 4th. (Special).—Cured of Bright's Disease when the grave yawned before him, Sandy Goulette, an old settler here, wants all the world to know that he owes his life to Dodd's Kidney Pills.

"I was swollen out of shape from head to foot. I was so short of breath I could hardly speak," Mr. Goulette states. "The doctor could do nothing for me. The minister gave me the holy sacrament and a good old priest came and told me that I could not live much longer.

"I was sick all winter and in the spring. I telegraphed two hundred miles for two boxes of Dodd's Kidney Pills. I took three pills the night they came and I got relief before morning. I took Dodd's Kidney Pills and they cured me.

"If anyone doubts this statement they can write me and I will give them names of people who know me and who will vouch for me. I am able to do my day's work as well now as I could ten years ago."

Dodd's Kidney Pills are no cure-all. They simply cure the Kidneys.

Are you Making or Breaking Your Child.

Undoubtedly I am going to shock a great many dear parents when I state most emphatically that the old-fashioned mother, who, exclaiming in righteous anger, "I'll whale you within an inch of your life," took her young hopeful out in the woodshed and did "whale" him with a big switch until ridges appeared on his legs and thighs, did not harm her child one-tenth as greatly as the tender-hearted mother who shut her boy up in a dark closet for two hours!

And I am absolutely certain that hundreds of well-meaning fathers are going to sneer at my statement that the old-fashioned father who used to take the end of a tug from Old Dobbin's harness, turn his big boy over his knees and "lambast" him with the aforesaid tug until son's howls could be heard in the next county, was doing his son a real kindness, as compared to the other sort of father who sends his erring son upstairs to bed without his supper. Nevertheless all this is true.

I am oldfashioned myself in the matter of corporal punishment for children. "Spare the rod and spoil the child" is solid sense. But pelase, I beg of every parent, never attempt to punish your child unless you can pause first and use good, sound judgment.

"Strike while the iron is hot," is good business sense, but to strike while the parent is hot is a crime against the child. First of all, then, wait until you have cooled down before punishing your child. Better let him go unpunished forever than strike him when you are 's'eeing red" with anger—for anger has neither conscience, nor a spark of common sense, nor an atom of judgment, nor a grain of fairness. Better let your child come up uncorrected than make a coward, or a dyspeptic, or a defective of him, by means of the wrong sort of corporal punishment.

If every parent who has occasionally vigorously boxed his child's ears could know the actual number of men and women going through the world today who are stone deaf because their ears were boxed, he would pale in fright and sickness at the knowledge, and never box a child's ears again.

If every parent could know the number of poorly nourished, dyspeptic people in the world today who became such solely because they were frequently sent away from the dinner table before they had half finished their meal, or sent up to bed supperless, no offence their cihldren could commit would ever inspire him to do such a thing again.

If every parent could know the actual number of nervous wrecks, physical cowards and long-suffering men and women terror-stricken at the dark, whose condition is due solely to the fact that their parents used to shut them up in dark closets, he would fight the person who even suggested such punishment of his own children.

"I have never been able to hear a sound in my right ear," a very well-known artist told me once, "since the day my mother 'snapped' me in the ear with her finger, upon which was a heavy brass thimble. It broke my ear drum, and before the injury was discovered it was too late to save my hearing. I had accidentally dropped a saucer and broken it."

One mother caught her little girl eating jam from a jar she had been forbidden to touch. This mother didn't believe in whipping a child, so, for punishment, she made the little girl eat all the jam in the jar. Fortunately it was a small one, but at that I was afraid for a while that this mother wasn't going to have any little girl, and I told her so.

While I boast of being old-fashioned in the matter of punishing a child, I am not old-fashioned enough to believe in spanking, I know that children have been spanked from time immemorial. I know this is because of the general belief that the blows fall on a locality where there can be no physical harm, but plenty of pain. If this were true I would be for spanking first, last, and every time a child needed correcting. But it isn't true, because not many people know how to spank a child without hurting him. The child squirms too, and the result is that many a youngster has been pounded squarely on the tender base of his little spine, with some fearful results. Cases of paralysis, of crooked and otherwise injured spines have come out of such spankings.

If you are going to punish a child in that particularl locality, use a little switch, not a heavy one, but a very light one, so that there will be plenty of tingling and smarting, but no hard blows. A child may be switched about the legs too, without injury, but never with anything heavier than a switch.

And again, remember that your child is going to be young only a little while and, God willing, an adult for many years. And while an adult he cannot run out and play. His play days are short; let him have every one of them, every hour and minute that can be spared for his outdoor romping. Your child needs every minute of sunshine and every opoprtunity to run and laugh and exercise.

If you are doing any of these things I have warned against, you are breaking your child—breaking his health and disposition and digestion and tendency to smile and ability to be brave. But if you are waiting until your anger has passed before administering punishment, and if you do administer it with good judgment, as I have suggested, you are really making him. Every child need a little punishment, and deserves it at times, but no child deserves any treatment that will injure his health and happiness.—Dr. W. Peabody Bartlett.

Dyeing on the Farm.

"What are you going to do with those dresses?" asked my husband one day in the early spring, coming into the living-room and finding me busy with a number of old dresses belonging to Little Daughter. They were dreadfully faded, but the cloth was still fairly strong, and except for being short, they still fitted.

"I'm putting on cross-way bands on the bottom of the skirts," I replied, "and bye and bye I'll dye them and she can wear them during the vacation, and save her school-dresses for the fall term."

"Nonsense! Don't fuss with them!" he objected, eyeing the sorry lot with obvious disfavor. "Get some new ones if she needs them! Those aren't worth the work!" For Husband liked to see Little Daughter prettily dressed.

Nevertheless, I kept on with my work, and when the dresses were laid away to await the dyeing-day, each was let down with a cross-way band made of factory cloth. I paid ten cents for a package of pink dye, and had a dyeing. The result was three really pretty pink dresses and a pair of pink bloomers, which she is still wearing, and which have reconciled her father to the old garments. Another dress was later dyed blue.

A relative, who lives in town, frequently sends me the outgrown rompers and Russian suits of her little folk, for me to use for my small boy and baby girl. When these are very light-colored or faded, I dye them navy or dark blue, cut off the long blouses into short ones, and the boy has some neat play-suits, while the baby-rompers are saved until I have a dyeing, and colored pink or blue.

My husband had a number of faded light shirts, and several dress-negligee which had come to mending. I dyed these dark blue, together with several of his faded workshirts, and now he has some neat-looking dark shirts which would otherwise have either been discarded or worn looking dirty all the time. When the shirts have no soft collar, I put one of factory-cloth on before dyeing, and it looks all right when the shirt is done.

For a long time I had wanted a lavendar dress, but was afraid the color would not be becoming. I had an old lawn skirt, a lawn shirt-waist, and a white drop-skirt and corset-cover which I decided to risk. I dyed them all with half a package of purple dye, and produced a really pretty lilac dress, when worn over white, and a darker shade when worn over the foundation suit that I colored. I also put in an old silk girdle which took a little different but harmonizing color, and adds immensely to the gown. I cut the neck out and wear a deep white lace collar with it, and everybody says it's very becoming. As for house-dresses, I always dye them when they get faded, and so get the last bit of wear out of them.

I have dyed table-covers, ribbons, winter caps and mittens for the children, their little coats and light stockings which have been given me. When dyeing garments, I usually put in a piece of white cloth, to use for mending.

Just now I am saving some cloth grain-bags in which my husband buys a certain kind of feed, to make into a comforter. I shall dye them blue for one side and red for the other, and already have the blue ones dyed. Even the string with which they were sewed I have ravalled out, wound into

a ball and intend to use to tie the comforter.

I use comemrcial dyes, and follow the directions on the package. I mention the brand, because I could not guarantee results with other kinds which I have never used. I do not maen this as in any sense an advertisement, but simply a pointer to some farm wives, by which they can dress themselves and children better, and have nicer-looking things in their houses. Many seem to think dyeing is a very difficult thing. It is no more so than baking bread or cake, but you must follow the recipe (directions) in both cases, or you can't expect perfect results.—Mrs. W. S. W., in Maine Farmer.

Boiling Sugar.

To boil sugar is one of the fine points of the science of cooking, but the uses of the different forms of boiled sugar are so varied that it is worth some practice to acquire the necessary skill.

As the sugar boils it passes rapidly from one stage to another and must be watched carefully. Success depends on one's ability to tell the exact point at which to arrest the cooking. It is extremely difficult to tell by the ordinary way of testing by dropping it in water or by dipping in the fingers and as a second's time will make all the difference between good and bad results, every scientific cook should have a sugar thermometer and syrup gauze just as any scientist needs proper instruments. By the aid of these two utensils many things that have seemed difficult for the amateur cook to attempt become simple, such as making perfect fondant, spun sugar and good candies.

As the sugar boils the great care is to prevent its granulation. The tendency for sugar is to resume its original crystalline form. To prevent this the liquid must not be jarred or stirred from the time the sugar is dissolved. If crystals form about the edge of the pan above the sugar they must immediately be wiped away with a brush (kept for the purpose) dipped in cold water. If they are allowed to remain the whole mass will granulate. A very little cream of tartar (a scant half salt-spoonful to a pound of sugar) added at the beginning makes the sugar less liable to granulate.

Sugar has a great affinity for water and the atmosphere should therefore be very dry. Never attempt to boil sugar on a damp day or when there is any steam in the room.

The different stages given below follow very quickly after each other, so that the heat should be moderate and careful attention given it.

To arrest the cooking quickly, as is necessary, place the saucepan quickly in a larger pan of cold water. If by accident it passes the right stage, granulates, or hardens, add a spoonful of water and continue the boiling. No sugar need ever be wasted.

The Degrees

Following are exact degrees of sugar boiling and their tests:

215 degrees, small thread stage.
217 degrees, long thread stage.
220 degrees, little pearl stage.
222 degrees, large pearl stage.
230 degrees, the blow stage.
232 degrees, the feather stage.
236 to 238 degrees,, soft ball.
246 to 248 degrees, hard ball.
290 degrees, small crack.
310 degrees, crack.
345 to 350 degrees, the caramel.

How To Test It.

Small thread: Press a little of the syrup between the thumb and fingers. A ring will form and a fine thread be drawn out which breaks at once and returns to the drop. Large thread: the thread draws a little farther than the first. Little pearl: thread stretches long between the fingers, but breaks. Large pearl: thread stretches long between the fingers and does not break. The blow: twist a broom straw into a loop. When dipped in a film will fill the loop which may be blown into a bubble. The feather: fine threads will fly from the bubble. Soft ball; a little dropped in cold water will form a soft ball. Hard ball: it will form a hard ball. Small crack: when dropped in cold water will break. Crack: breaks off sharp when put in cold water and crackles when chewed. The caramel: it assumes a yellow color and care must be taken that it does not burn. The cooking should be arrested instantly.

If sugar at the caramel is used the work must be done with great rapidity, as it hardens quickly. If it does harden before all is used, add a spoonful of water and reboil.

Correct Position of Handling the Brush.

Did it ever occur to you that the surface of the back amounts to one-sixth of that of the entire body?- The osteopath will tell you it is the source of the entire nervous system—and we cannot ignore the opinions any longer of those valuable practitioners. It is from the spine that they treat every organ of our bodies—for that is the foundation of either health or sickness to the entire body. One-sixth of the area means also one-sixth of our skin pores and glands, yet how many of us take the trouble in the daily bath to keep these little workers clean and healthy, to perform their share in throwing off the waste from the body?

It is next to impossible for most of us to reach all parts of our backs and do good, vigorous scrubbing, so here with where the long-handled bath brush is needed. The picture shows how easily it can be made to cover the entire back. Cleansing the pores thoroughly is only one part of its work, as the greatest advantage will come from the splendid circulation it will create all along this important nerve centre, radiating health to every organ of the body. It will also make the skin firm and fine-grained, taking off much of the superfluous fat so many women are apt to get, especially over the top of the corset line.

The arm exercise that attends the use of the back scrubbing rounds the elbow and develops the chest and arms, adding still another point in favor of establishing the habit of using the brush.

Serviceable Suggestions.

As the truly conscientious housekeeper tries to learn something new each day about management of her domain, the idea of a holder for suggestions is not bad. The holder is a small empty picture frame hung above the work table. Recipes to be tested or suggested helps are slipped into it to be read, studied and tried as opportunity offers.

Some kitchen tables have glass tops and the clippings can be slipped under the glass instead of into the frame, or being pinned onto the window curtain or the wall.

Serviceable suggestions that you may want to rememebr are the following:

Kerosene removes stains from tin ware, porcelain tubs and varnished furniture; saturate a woolen cloth and rub with it; the odor evaporates.

Old newspapers clean stoves beautifully, save floors, table tops and fresh aprons when spread over them, as well as being useful for polishing kitchen windows.

A small wisp brush is better for cleaning greasy pans and kettles than the string mop you use, for the dishes. You can make these wisps by tying bunches of straw from old brooms together, but you can buy them two for five cents. A little soap powder sprinkled on them makes a fine strong suds for the tinware and cooking utensils.

Wet the broom when starting to sweep; it makes it more pliable and less hard on the carpet's pile and prevents dust from rising.

Gas and lamp chimneys, earthenware and baking dishes are toughened before using by being put into cold wtaer that is heated gradually until boiling and then cooled slowly.

The metal taste aparent in iron and tinned ware may be removed by boiling a little hay in it. In Irish dairies everything used to contain milk is scalded with hay-water, as it is a great sweetener of iron and wooden articles.

Powdered gum champhor is said to drive cockroaches away.

Boiled linseed oil applied to the kitchen floor gives a finish that is easily cleaned. It may also be painted over the draining board of the sink and does away with hard scrubbing. It must be renewed twice a year.

A lump of charcoal should be kept in the refrigerator to keep it sweet. When putting your best tea or coffee urn away drop a bit of charcoal in it and prop the lid open with a tooth pick or tiny stick.

Grease may be removed from unpainted boards by putting soft soap on the spot and holding a hot flat iron above it; wash thoroughly afterwards.

To take rust from flat-irons tie yellow beeswax or parafin in a cloth, and when the iron is warm, but not hot enough to use, rub with the wax and then rub through sand or salt. This will also remove rust from iron.

Old stocking tops make good dusters when sewed together; they also make good polishing cloths for oiling and rubbing down floors and furniture. Several stocking tops cut into strips and dipped in parafin oil make a fine dustless mop for hardwood floors.

Steel carving sets and knives should be rubbed with a bit of suet before being put away. Do not wrap steel or silver in woolen or in white canton flannel, the sulphur in these materials injures the metal.

Delicate china with gilt bands and floral decorations should not be wiped with the ordinary crash or kitchen towel. Use thin cloths, or scald and drain dry, and the figures will keep their beauty to the end.

The Provincial Chemical Fertilizer Co., Ltd.,

ST. JOHN, N. B.

announce that in addition to their regular Brands of Fertilizer, so well and favorably known throughout the Provinces, they are prepared to furnish

Pulverized Lime Stone

and Land Plaster

on very favorable terms, in either bulk or bags and solicit inquiries.

POULTRY SUPPLIES.

SISTER: READ MY FREE OFFER.

I am a woman.
I know a woman's trials.
I know her need of sympathy and help.

If you, my sister, are unhappy because of ill-health, and feel unfit for household duties, social pleasures, or daily employment, write and tell me just how you suffer, and ask for my **free** ten days' trial of a **home treatment** suited to your needs; with references to Canadian ladies who gladly tell how they have regained health, strength, and happiness by its use. I want to tell you all about this successful method of home treatment for yourself, my reader, for your daughter, your sister, or your mother. I want to tell you how to cure yourselves at home at trifling cost, and without aid from anyone. Men **cannot** understand women's sufferings; what we women know **from experience**, we know better than any doctor: and thousands have proved there is **hope** even **for the hopeless** in my method of home treatment. If you suffer from pain in the head, back, or bowels, **feeling of weight and dragging down sensations, falling or displacement of internal organs, bladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly or irregularly, bloating or unnatural enlargements, catarrhal conditions, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living, I invite you** to send to-day for my complete **ten days' treatment** entirely **free and postpaid**, to prove to yourself that these ailments can be easily and surely removed at your own home, without the expense of hospital treatment, or the dangers of an operation. Women everywhere are escaping the surgeon's knife by knowing of my simple method of home treatment, and **when you are cured**, my sister, I shall only ask you to pass the good word along to some other sufferer. My home treatment is for all.—**young or old.** To **Mothers** of **Daughters**, I will explain a simple home treatment which speedily and effectually cures green-sickness (chlorosis), irregularities, headaches, and lassitude in young women, and restores them to plumpness and health. Tell me if you are worried about your daughter. Remember **it costs you nothing** to give my method of home treatment a complete ten day's trial, and if you wish to continue, it costs only a few cents a week to do so, and it does not interfere with one's daily work. **Is health worth asking for?** Then accept my generous offer, **write for the free treatment** suited to your needs, and I will send it in plain wrapper by return mail. To save time you can cut out this offer, mark the places that tell your feelings, and return to me. **Write and ask for the free treatment to-day**, as you may not see this offer again. Address:

MRS. M. SUMMERS BOX 309, WINDSOR, ONTARIO

Gas in the Bowels.

Gas in the bowels is produced by stasis or stagnation, almost invariably evidence of insufficient intestinal activity. Whenever the food materials are delayed in their movement along the intestines, fermetnation and putrefaction occur, with the development of gases. When gas accumulates in such a quantity as to produce distention of the intestine, the result is a final spasmodic contraction accompanied by pain; this is known as colic. Immediate relief may often be obtained by means of a large, hot enema; the quantity of water required is usually two or three pints; the temperature should be 100 deg. to 105 deg. The addition of a little soap to the water is helpful. When the check valve placed at the juction of the small intestine with the colon known as the ileocaecal valve, becomes incompetent, the colon, when it contracts to expel its contents, discharges at both ends and a portion of the liquid faecal matters are forced back from the large intestines into the small intestine. In such cases the enema affords only partial relief; the gas distension still continues. For definite relief it is necessary to take measures to secure increased intestinal activity. It has now been ascertained that with very rare exceptions gas in the stomach consists chiefly of air which has been swallowed. The stomach is irritated and involuntary swallowing of air occurs. This morbid condition, known as aerophagia, is somewhat akin to hiccough. By an involuntary movement air is sucked into the stomach; after a time the air is returned, and as soon as the accumulation recurs, the belch is repeated. The gas expelled is, however, for the most part, made up of swallowed air. In such cases the remedy must be traced to the cause of gastric irritation. In a majority of cases the stomach is the seat of the hyperacidity; that is, an excess of gastric juice is formed. To relieve this condition the diet should be bland; that is, non-irritating. Mustard, pepper and other condiments should be avoided, with the exception of a sparing use of salt. Tea and coffee, and even the free use of water and other liquids at meals, must be avoided. Flesh meats of all kinds stimulate the acid-secreting glands of the stomach. Olive oil taken in a dose of one or two tablespoonfuls at the beginning of each meal lessens the formation of acids. The application of a hot bag over the stomach for half-an-hour after each meal is beneficial, but the most definite benefit will be derived from increasing the activity of the bowels. Normally the bowels should move after each meal. This prevents the toxema to which gastric irritation is in most cases due. —"Good Health."

Exercise for Indoor People.

Do you work indoors? Are your exertions more mental than physical? If so, let me suggest that you read supplement 24 to public health reports by Dr. F. C. Smith of the U. S. health service.

In this timely publication he warns us of the rising death rate after the age of forty and blames our complicated social and business life for this condition. As an antidote for this state of physical inertia and mental strain, he suggests—

Exercise and recreation which should be inseparable, i.e., "A man's exercise should, if possible, be his hobby."

For those wishing "a short life and a merry one," this accommodating pamphlet has a suggestion also. Try heavy athletics for Dr. Smith says that they are almost certain to shorten life, because the after effects of severe exertion are harmful.—Marion V. Higgins, Colorado Agricultural College, Fort Collins, Colorado.

Are these your Symptoms ?

PROSTRATION
LACK OF ENERGY
BRAIN FAG
PAINS IN THE BACK
STOMACH CATARRH
SLEEPLESSNESS

Sick Children Made Well

Every mother likes to see her children the picture of healty and vitality.

Trade Mark

I find that the stomach is a source of constant trouble to some children, and there is a constant need of some safe remedy. A disordered stomach, too, frequently breeds worms, either stomach worms or pinworms.

You can absolutely depend upon Dr. True's Elixer to expel worms and tone up the stomach, bowels and general health.

Dr. True's Elixer has been on the market for over sixty years. That's proof of its efficiency. Get the time-tried Dr. True's Elixer, the Family Laxative and Worm Expeller. Good for adults also. At your dealers, 35c, 50c and $1.00. Advice free. Special treatment for tapeworms. Send for book.

Knowlton, Que. Dr. True

Short Courses in Agriculture on P. E. Island.

The proposed series of Short Courses were commenced at Palmer Road on January 10th, and have been continued at O'Leary, Egmont Bay and Mount Carmel. Many of the people had to drive a considerable distance, and some boarded in the vicinity during the entire course. The programs were arranged to meet the most urgent needs of each community. The opportunity to discuss conditions in their home district, without conisdering those in some other part of the Island appeals very strongly to all the farmers. Most of those attending were at every session.

The lectures commenced at 9.30 a. m., and concluded at 11.30 a.m., and from 2.00 p.m. to 4.00 p.m., and 7.00 p.m. to 9.00 p.m. Such an arrangement allowed time to do the necessary chores and drive two to three miles. The large number of young men attending, considering that many have enlisted, speaks well for the communities.

The course at O'Leary was conducted under difficulties; the weather being very cold and many drove seven and eight miles to attend. The course at Egmont Bay and Mt. Carmel were conducted only six miles apart, but the attendance warranted the work put upon them. The earnest manner that was apparent encouraged everyone to put forth every possible effort. Revs. Gauthier, Boudreault and Arsenault, suported the courses very heartily, not only by encouraging the people, but by taking an active part in most of the sessions.

The attendance was:

	Sessions.	Attendance.
Palmer Road.....	13	99
O'Leary	9	60
Egmont Bay	14	110
Mt. Carmel	13	127

Ladies attended all the poultry lectures, and occasionally others, especially at night when the lantern was used.

The members of every branch of the Dominion Department of Agriculture cooperated heartily, with the Provincial Department, thus making it possible to place on well balanced courses. At every point, requests were made for a course to be held next winter or earlier if possible.

All of the courses as yet have been held in Prince County, and the necessary preliminary organization was done by W. J. Reid, B. S. A., the District Representative. He also gave the larger number of the live stock lectures and demonstrations during the courses.

Mr. J. A. Clark, of the Experimental Farm, took charge of all the work in grains and lectured on tillage. Much practical work was done with wheat, oats and barley. Leslie Tennant, B.S. A., was reponsible for the weed seed and grass lectures. Mr. Morrow discussed the care of milk and Mr. Marcellus represented the Poultry Division.

Plant diseases and potato work came under Mr. Murphy, plant pathologist at the Experimental Farm.

The marketing of wool was demonstrated by Mr. Thomson of the Live Stock Branch. Under drainage is a live topic in the Western part and created considerable interest. The destruction of the English sparrows was one of the lively topics and the discussion probably will result in local organization.

Community interest and organization may be one of the most potent influences emanating from the courses; probably never before was the attention of the entire communities concentrated on a common subject for one week.

The next course will be in the Consolidated School at Mt. Herbert. The school has not been used for some time and it is hoped that it will be put to community use continually.

The publisher of the best Farmer's paper in the Maritime Provinces in writing to us, states:

"I would say that I do not know of a medicine that has stood the test of time like MINARD'S LINIMENT. It has been an unfailing remedy in our household ever since I can remember, and has outlived dozens of would-be competitors and imitators."

Vacancies in Offices

Caused by so many enlisting for military service, have caused a great demand for well qualified young men and women.

Now is the time to qualify.

Catalogues to any address.

THE ST. JOHN Business COLLEGE

Two Weeks Short Course in Agriculture.

At Woodstock, March 20, to April 1.

The New Brunswick Department of Agriculture is arranging for a Two Weeks' Course in Agriculture for farmers and farmers' sons to be held in the Agricultural School at Woodstock, from March 20 to April 1. No effort is being spared to make the course as practical and interesting as possible, and the staff of instructors, in addition to the officials of the Provincial Department of Agriculture, will include Mr. S. J. Moore, Seed Commissioner for the Maritime Provinces; Mr. W. W. Hubbard, superintendent of the Dominion Experimental Station, Fredericton; Mr. G. C. Cunningham, Dominion Expert in Plant Diseases for the Maritime Provinces, and other leading agricultural authorities in their own special subjects. The first five days of the course will be devoted entirely to lectures and practical work in fertilizers, soil management, insect pests, plant diseases and spraying, leading up to the work of the last seven days which will be devoted exclusively between field crops and live stock. If you cannot spare the time to attend the entire course, be sure and come to those sessions in which you are most interested. Remember that there are no fees and all the lectures are free.

Board and room may be obtained in Woodstock for from $4.00 to $4.50 per week, and a list of suitable boarding houses will be provided to students. Applications for enrolment in this course will be received up to March 18th but should be sent in as early as possible in order that the Department may have an idea of the approximate attendance and make preparations accordingly. It is hoped to publish the full programme of the course in the next issue of this paper.

Intending students should purchase a one-way, first-class ticket, and secure a Standard Certificate from the ticket agent, or if travelling by more than one line, secure a certificate from the agent of each line. These certificates, when signed by the authorized official of the Department of Agriculture, will entitle the holder either to return fare free or at a much reduced rate, depending on the number of students in attendance.

Send applications for enrolment and inquiries for further information to A. G. Turney, Fredericton, N.B.

PEERLESS Long Span Gates

are so rigid—so strong—so thoroughly and scientifically braced that even after years of service they retain their original firmness. If properly hung, there will be no dragging on the ground—no necessity for having to lift or carry the gate open or shut. It will always swing easily and always hold its shape.

Made of Best Materials

Frame work of 1¾-inch steel tubing electrically welded together. Peerless pipe braced gates are all filled with No. 9 Open Hearth galvanized steel wire—built for strength and durability—weather proof and stock proof. Send for free catalog. Ask about our farm and poultry fencing, also our ornamental fence and gates.

Agents nearly everywhere. Agents wanted in open territory.

Boys' and Girls' Poultry Club Competition.

Rules and Regulations

1. Open to boys and girls of sixteen years and under, sons and daughters of farmers in each county in New Brunswick.

2. A boy or a girl on the farm may be the competitor, but only one in a family can enter the contest.

3. Each competitor must do all the practical work himself or herself as the case may be, but can receive advice and direction from parents or guardian.

4. Each boy or girl entering the contest must set the eggs under hens or in incubator, attend and manage the incubation, care for, feed and raise the chickens to roaster age in the fall. (April and first week in May best time to hatch out the chicks.)

5. The breeds to be used in the contest are pure-bred Barred Plymouth Rocks, Rhode Island Reds, Wyandottes and Orpingtons or high grade crosses from pure-bred males of above breeds. Only one breed must be used by each contestant in order to have the lot all alike and uniform. Suitable eggs can be purchased for incubation if not produced on the farm.

6. The Department of Agriculture offers three prizes to the competitors in each county for the best dozen chickens raised by the farmer's boy or girl in each county according to conditions in Section 4.

7. Twelve or more chickens (cockerels preferred) of any of above breeds mentioned in Section 5 to be put into a fattening crate or pen the third week in October, 1916, and fed according to directions supplied to each contestant by the Provincial Poultry Superintendent.

8. Birds to be fed at least fourteen days and not longer than eighteen days, then starved twelve hours and killed by bleeding in the mouth, plucked dry, undrawn, shaped and packed in a box of the proper size to contain twelve roaster chickens and expressed to the Poultry Superintendent, N. B. Cold Storage, St. John, N.B., with the name a naddesrds-Y with the name and address of shipper on the box, from the 7th to the 10th of November.

9. Information as to above method will be supplied by the Poultry Superintendent, who will be judge and will award the prizes according to merit of the exhibit from each county. In addition to the prize, the chickens will be sold at the highest market price and same remitted to the shipper.

10. Prizes will be awarded for the largest, best fleshed, best quality, best conditioned, best dressed and best packed box of twelve chickens. The contestant is allowed to select for competition the best twelve birds from his or her own flock.

11. Each competitor's work during the competition will be subject to the

OLEMNTRA	BEUQCE	OTOROTN	PNIENGIW

Can you arrange the above sets of jumbled letters into the names of four well known large canadian cities? If so, you can share in the distribution of the prizes below. It is no easy task. But by patience and perseverance you can probably make out 2 or 3 of them. To the person who can make out the largest number we will give the sum of One Hundred Dollars. To the person making out the second largest number the sum of fifty dollars. To the person making the third largest number the sum of thirty dollars. To the person making the fourth largest number the sum of twenty dollars. Should two persons send answers equally correct, the first two prizes will be divided between them (each receiving $75.00). Should three send in equally correct answers, the first three prizes will have to be divided (each receiving $60.00). Should four persons send equally correct answers, the whole sum of $200.00 will be equally divided (each receiving $50.00) and so on in like proportions, provided they comply with a simple condition about which we will write as soon as answers are received. We do not want a cent of your money when you answer this advertisement. If you can find any of the names, write us to-day enclosing stamp for our reply. Do not delay.

$200 IN CASH And Number of Valuable Premiums GIVEN AWAY FREE

The St Stephen Poultry Show.

The Twelfth Annual Exhibition of the Charlotte County Poultry and Pet Stock Association held in Agricultural Hall, January 19th-22nd was the first show of the kind ever held in St. Stephen which was open to the whole province. The Association has held an Exhibition every year since its reorganization in 1910 and each year has been a greater success than the previous, until this season, when between two and three hundred birds were entered from outside the county, a number equal to the total entries in former years, while this year's total was between five and six hundred,—or nearly double any previous exhibition. The management regret there is no hall nearer the business centre in which to hold the show as the distance in cold weather affects the attendance. Those who failed to attend this year were the greater losers, as many of the foreign birds were of breeds not usually seen at poultry shows on the St. Croix. Many prizes were carried away by the outside exhibitors in breeds not generally kept by our local poultrymen but in classes where both competed together the local men held their own fairly well. Day Brothers of Moncton made a display of Light and Dark Brahmas, that would be hard to beat and was worth any poultryman's while to spend some time on. George H. Seaman, Moncton, secretary of the New Brunswick Poultry Association, who was a strong winner in R. I. Reds and Hamburgs, was surprised to find his Buff Orpington beaten, as they have been winning wherever shown. Mr. Seaman, while surprised, need not feel disappointed for Buffs, to win over Edd Hacker, of Milltown, must be of the "Madison Square Garden" class.

The secretary, R. W. Whitlock, who has for years been winning with his fine flock of S. C. White Leghorns, had to take second place to J. N. Ferguson, of Fredericton, who virtually swept everything in this class,—the only first falling to Mr. Whitlock being on cockbird, which, however, pleases him better than anything else he might win as the old bird is now well up in years and has never been beaten although shown in the Maritime Province Exhibition at Amherst.

Charles H. Smith, Moncton, made a clean sweep in the Black Langshans.

The S. C. Black Minorcas exhibited by R. B. Stewart, Moncton, were the largest ever shown here.

The judge pronounced C. F. McGarity's entry of White Orpingtons the finest in the Maritime Provinces.

Write TO-DAY for book "Helping Mother Nature"

Farmyard Manure

(Greatest of all Fertilizers)

Money-Maker for the Farmer

Sit down and carefully read "Helping Mother Nature." Chapter I. shows how manure assists the land, and its actual fertilizing value in dollars and cents. Chapter II. shows how manure loses its value by leaching and firing. Chapter III. goes on to show how it should be kept till used. Then go on to the next chapter about how to get the fertilizer distributed for dollars and cents profit. Chapter V. suggests how much to use, and why, and where. Chapter VI. shows how corn and similar crops can be fertilized to the greatest advantage—and so on right through the book. It is a book you will have to finish when you pick it up—it is so vitally interesting, and you begin to see where most farmers neglect an easy profit. Spreading the manure has always been an unpleasant and unsatisfactory job.

Must be Spread Fresh—or Great Value is Lost

Your land has never had the value of your farmyard manure, if the latter was dried out, leached, or fired!

This Book will Open Your Eyes! It's FREE!

Rev. D. R. Chowen, Milltown, is a new member but has the courage to enter in two of the hardest classes, the Barred Plymouth Rocks and White Orpingtons.

Miss L. C. Brown, a school teacher of St. John, entered a large list of Silver and Golden Campines, but her finest exhibit was in the S. C. R. I. Reds, in which was included a very fine cockerel, scoring 95 points. The exhibition was a comparison show, but this bird, as well as several others, was scored by special request.

E. H. Barter was the largest individual exhibitor, 47 birds, chiefly Barred Plymouth Rocks, with a few White Orpingtons. John P. Bain, of Hillside Poultry Yards, St. John, was a close second, with 45 birds, but a greater variety, including many of the game breeds. Scott & Warren, St. John, also made a large entry of many varieties not usually seen at our shows, including a number of games and bantams. C. R. Fitzsimmons, McAdam, made a very pretty display of White Bearded Polish Bantams.

J. W. Hulme, Milltown, was also a large exhibitor, including about every variety in the Standard from every class, section and country.

In the entry made by R. Stevenson of Milltown, were some high-class White Rocks. There is no disputing the fact, Bobbie not only brings good stock but he knows how to make a white bird white.

Edmund Carter had a few young birds from Barred Rock stock, procured from Dannie Pike and if his interest continues as in his first exhibit, he will make both Dannie and Mr. Baxter look to their laurels another year.

E. Klein, Milltown, was the largest exhibitor of Columbia Plymouth Rocks, the most recent variety added to the Government Prize List, and Helen Tourtillott introduced a still newer variety, the Pencilled Plymouth Rock.

J. T. McClure, Jack Dinsmore and Sedgefield Curran were the chief competitors in the White Wyandotte class, with the honors slightly in favor of McClure. John W. and Edgar Bailey displayed their usual assortment of Blue Andelusians and Black Leghorns.

The strongest competition in any class was in the R. I. Reds, in which were many entries from outside. However, both the president, F. M. McCready and H. D. Dinsmore, were able to capture some firsts and Dinsmore won handily in the "Ancona" class.

A number of young exhibitors entered in Classes they did not thoroughly understand and the Judge very thoughtfully took them in hand, showing them the different types and markings of the birds, explaining how and where to botain the proper birds fit for exhibition and, no doubht, they will all appear next year among the winners in thier classes.

Ralph McCready was the only local entry in the Utility Class which is a new feature in this section.

A number of birds were sold at the close of the exhibition. Donald Hawthorne purchased a trio of the prize-winning White Rocks and will exhibit in that class in future.

Darius Hyslop and Alvin Johnston of Moore's Mills, and A. D. Stevenson entered Toulouse, African and White Embden geese. A few ducks but no turkeys were entered.

The Leghorns had the largest entry of any breed, but the Barred P. Rocks out-numbered any one variety, while the S. C. R. I. Reds had the greatest number of entries in each of the four sections of their classes.

In the following list of pirze winners, the abbreviations are: C, for Cock; H. for Hen; R. for Young Rooster or Cockerel; P. for Pullet. The residence will be given the first time winner's name appears.

Barred Plymouth Rock, E. H. Barter, St. Stephen, 1st and second C; 1st and 2nd H.; 1st and 2nd R.; 1st and 2nd P.; first exhibition breeding pen; 2nd and 3rd cockerel mating pen; 1st and 2nd pullet mating pen. Hazen Linton, St. Stephen, 3rd R.; Wm. Finkle, St. Stephen, 4th R.; E. Carter, St. Shephen, 3rd and 4th P.; Rev. D. R. Chowen, Milltown, 5th R., 5th P.; H. B. Pike, 1st cockerel mating pen.

White Plymouth Rock—R. W. Whitlock, St. Stephen, 1st and 2nd C, 2nd and 3rd H., 3rd R; Robert Stevenson, Milltown, 1st H, 1st R, 1st and 2nd P.; Charles Irvine, Milltown, 2nd R, 3rd P.

Buff Plymouth Rock—Scott & Warren, St. John, 1st C.; 1st H.

Columbia Plymouth Rock—E. Klein Milltown, 1st H., 1st R., 1st P., 1st breeding pen.

Pencilled Plymouth Rocks—Helen Tourtilliott, 1st H.

White Wyandotte—J. T. McClure, St. Stephen, 1st and 3rd R., 1st and 3rd P.; Jack Dinsmore, 2nd R., 2nd P.; Sedgefield Curran, 4th R.

Silver Laced Wyandotte—E. Klein, 1st C., 2nd H., 2nd R., 2nd P.; J. M. Hulme, Milltown, 1st H., 4th P., 1st breeding pen; Harry Hulme, 3rd H., 3rd R.; John P. Bain, St. John, 1st R., 1st P.; Wm. Hulme, 3rd P.

Golden Laced Wyandotte—John P. Bain, 1st R., 1st P.

Columbia Wyandotte—E. Klein, 1st C., 1st H., 1st P; Edd Hacker, Milltown, 2nd H., 2nd P.

Sharp-pointed Eggs no Relation to Sex.

Certain things affect the sex of chicks, but the shape of the eggs does not indicate the nature of its contents in this respect. The age and condition of the hen causes variation of shape of eggs without regard to the potential chicks' sex. The writer has repeatedly set two machines, one with the eggs which are most pointed, the other with eggs which are well rounded, and never yet had results which would bear out any of the superstitions as to judging sex by shape of egg. A pullet's eggs are smaller and more pointed than those of old hens, and certain abnormal conditions of the oviduct will also affect shape of eggs.

A vigorous young male penned with few old hens will result in more males than females among the offspring. If pullets or young hens are bred to an old cock more females than males will be hatched. Late in the season, when the young male has lost some of his vigor, the result will be a preponderance of female chicks if he does not limit his attentions to favorites. The percentage of fertility will be greater early in the season if a cockerel is bred to two-year-old hens; but unless his harem is rather large, the percentage of males in the resultant offspring will be unduly heavy. So the size of the breeding pen should be decided by the vigor of the male and the season of the year. If the cockerel has never been permitted to run with the females, give him more females in the breeding pen than if he has constantly been with the flock, to safeguard against the preponderance of cockerels among the chicks.—H. A. B.

Children are little sensitive mirrors of surrounding thoughts and conditions.

"It is such a Saving in Labor; I must have a Power Outfit."

In his sixth order to us, Mr. J. C. Harris of Ingersoll, Ont., says more for the Spramotor than our most enthusiastic advertisement. A man may buy a thing once and be dissatisfied, but when he comes back for additional purchases, there is only one conclusion that we can come to, and that is that articles must be all right. We never claimed more for the

Spramotor
It isn't a SPRAMOTOR unless we made it

than that it would do the work required of it effectively and economically and in all things give satisfaction. And letters which we have received and are constantly receiving from farmers all over Canada, signify that our statements have been met with a service that is making staunch friends for the Spramotor wherever it is used. Over 100 Gold Medals and Special Awards to the credit of the Spramotor shows that these expressions of confidence are merited. Suppose you write now while the matter is fresh in your mind for a copy of our booklet on crop diseases.

Nova Scotia Institutes.

(Continued from Page 279).

lecture was enjoyed immensely by the large audience of women and men and his optimistic outlook on the close of the war, came as a ray of light amidst the gloom of these dark days. Principal Cumming of the College, gave a short but eloquent address, complimenting the Institutes on the splendid work achieved during their short life and encouraging them for the future. A resolution of thanks was passed to the speakers of the first meeting, to Mrs. Sexton, Rev. Mr. Wilson, the Executive of the Local Council of Women, the Town Council of Truro, and all those who had contributed in any way to the success of the Convention, moved by Mrs. Polley of Lunenburg, and seconded by Mrs. Davis of East Leicester and passed unanimously, all the delegates rising to signify their individual enjoyment of the three days in Truro. With the singing of "God Save the King," the third Convention was brought to a close and the feeling was that the meetings had given a great impetus to the future life of the Institutes of Nova Scotia.

The report read by the Superintendent of Institutes for Nova Scotia, Miss Jennie A. Fraser, was as follows:

Madame Chairman and Delegates:

In welcoming you for the third time to these grounds, I feel that these conventions have marked the milestones of an eventful three years. In welcoming you to this building for the first time I feel that an eventful future lies before us. Let us look back for a little time and view the road over which we have travelled and then let me look forward and see what the future may hold for us.

Just two and a half years ago I sat in a hall in the county of Pictou listening to a warm-hearted, enthusiastic woman place before her audience the work that had been accomplished in another province through the efforts of the Women's Institutes, and I wondered in a vague sort of way if the women of Nova Scotia would feel the appeal of a society established along the broad and practical lines of the Women's Institutes. That evening saw the first Institute organized in Nova Scotia, and while we have gained and lost since that evening, our gains now far exceed our losses and the organization has made such a very special appeal to the minds and the hearts of the women of our province that they, individually and collectively, have built up in these two and a half years, an organization that stands for much in the life of Nova Scotia and is, I am not afraid to state, its most representative society.

You know pretty well the story of Women's Institutes in Nova Scotia. Eight Institutes organized in July of 1913 in Pictou, Colchester and Cumberland Counties; six more added in September of the same year in Hants, Kings and Annapolis; the Convention held in January of 1914 which gave confidence and inspiration to the fourteen; another Institute added to the number in January, 1914—the first in Lunenburg Co.—and in the summer of 1914 after a vigorous campaign, the list of Institutes was swelled to thirty-six, the new counties coming in being Yarmouth, Antigonish, Guysboro and Queens and several new Institutes organized in Kings, Annapolis and Lunenburg.

In August of 1914 the terrible war-cloud broke in Europe and we were face to face with the most tremendous issue that the world has ever known. The appeal went out for Red Cross funds, Red Cross supplies, Patriotic funds and before us was placed the suffering and dire need of that most gallant little country, Belgium, and we, with the other women of Canada, put our hand to the plow and we have neither faltered nor turned back although the furrow has been a long and weary one and at times, almost unendurable. But we were ready for the call and this is just another instance of a fact that is becoming more recognized every day—that organization can achieve and carry on work so much more sucecssfully, expeditiously and thoroughly than any haphazard attempts.

In January, 1915, we held the second Convention and if there were any doubts in the minds of the members of the worth and usefulness of the Institutes, they must have been eliminated, after listening to the Reports read by the delegates, of the work accomplished by their societies. During last summer fifteen Institutes were added to the list, seven dropped out, leaving the list standing at forty-four, distributed as regards counties as follows:

Pictou, 2; Colchester, 1; Cumberland, 3; Hants, 3; Kings, 5; Annapolis, 2; Digby, 4; Yarmouth, 4; Lunenburg, 7; Queens, 3; Halifax, 1; Guysboro, 4; Antigonish, 1; Cape Breton Island, 4. Our membership stands at 1383 with Weymouth, the banner Institute, boasting a membership of 81, Port Williams next with 69, D'Escousse next with 51 and Tatamagouche running very close with 50.

Those Institutes that found the burden of existence too heavy may be resuscitated in the course of the years. We cannot look for continued and uninterrupted success—if we maintain and hold a steady and strong growth we can be satisfied, and as the Institutes grow stronger and get more in touch with one another we will be better able to help the weaker Institutes and lend them a hand. In the meantime we can cheer ourselves with this remark "Even failure is only a relative term, you know. And that which the world calls failure may have some beter name in another planet."

When I make the statement that fifteen Institutes were organized during the past summer, I don't want you to think that only fifteen meetings were held and that we just went out and organized those fifteen Institutes. Alas! things are not achieved in such an easy fashion. Personally I held fifty-two meetings from the first of June to the end of November; nineteen were visits paid to organized Institutes and twenty-seven were organization meetings held with the assistance of Miss Dutcher—this number of meetings was lower than usual owing to the impossibility of my leaving home until June. Then Miss McQuire held fifteen meetings for organization purposes, so you see, we do a great deal of fishing for a very few bites, but we are so pleased when we land a lusty trout in the shape of a new Institute that it rewards us for days and days of disappointing effort. It pays even for an empty hall or schoolhouse as a reception to two shrinking females, and it even pays for several unenthusiastic audiences, a contingency, let me assure you, that is much harder to endure successfully than an empty hall. Several of the Institutes organized during the summer are doing Red Cross work for the first time in their community, not having realized its extreme importance before, and we feel that we have achieved good work for the country, that requires so much of that sort of effort now.

In 1914 we were fortunate enough to secure Miss Marion Cox, of the Normal School to give cooking demonstrations to the Institutes in Hants, Kings, Anapolis, Yarmouth, Lunenburg and Queens Counties, which were evidently much appreciated. The past summer we were also fortunate enough to be able to procure Miss Annie Redmond of Dartmouth, to give demonstrations in Guysboro, Antigonish, Colchester and Cumberland counties. Miss Cox and Miss Dutcher gave demonstrations in Pictou County and the latter gave one in Bridegwater. It was endeavored to have these demonstrations as practical and useful as possible in the limited time. We hope they met with the aproval of the Institutes and that they were found to be a help, as we plan to arrange a series on a much more elaborate scale for the summer months.

We utilized the generous Travelling Library scheme of McGill University in order to help the Institutes procure books, and seventeen Institutes availed themselves of the opportunity and found the books of the greatest help. This offer stands during this year for any Institute, new or old, that cares to send in an application.

During the Autumn I had the pleasure of judging at nine exhibitions and we procured Miss Redmond for two. I would like to appeal to the Institutes for a more enthusiastic interest in the County Exhibitions. The Institutes of North Queens have done much toward the improvement not only of the Annual Exhibitions of North Queens but also of the Exhibition building. Many of the Domestic Departments in the Exhibition lists now in use by the County Exhibitions are sadly in need of additions and substractions, and I owe a debt of gratitude to the Exhibition Commissioners for the kindly manner in which they have met any suggestions and the prompt way in which they have utilized them, but I feel that the lists still leave something to be desired and that not only the lists but the judging requires standardizing.

I feel that you as representatives of your Institutes require the highest praise for the work you have achieved since the first inception of Institutes in Nova Scotia. If it is not for anything else but the Red Cross work the greatest credit is due you. I wonder if you realize just how much money you have paid out of your Institutes for Red Cross, Patriotic, British Red Cross and Belgian Relief since the war began? To the first three you have given the altogether splendid sum of $7970.32; for Belgian Relief, $692.67; and you have forwarded, as nearly as I can figure it out, 162 large boxes. Then you presented the Provincial Red Cross Society with a motor ambulance, procured from the McLaughlin-Buick Company at a cost of $1,540.00. We are indebted to this firm for a splendid photograph of the ambulance and a silver plate affixed to the side bearing the inscription 'Presented by the Women's Institutes of Nova Scotia." Several of our larger Institutes, to avoid confliction, do Red Cross work in conjunction with or through another society, so you will not wonder that I say you are deserving of the highest commendation. The largest amount raised by a single Institute for these various causes was achieved by Canning, which stands at the head of the list with $1001.00; Port Williams comes next with $690.00 and Sherbrooke, Guysboro Co., comes in a good third with $588.24. Lakeville, Kings Co., leads in Belgian Relief with $229.90, and Aspen, Guysboro Co., next with $132.00. The hard part of this giving is that it must be done over and over again for Red Cross and Patriotic, for Field Comforts and other causes are making their appeal. We cannot shut our eyes to the terrible conditions holding among the Serbs and Montenegrins. They are our allies and their intense and cruel suffering cry to us for aid. We cannot rest feeling that we have done what we could, —we will not have finished when we feel we have done what we could not possibly do—then only will we commence to feel the stress of this war in any degree that may slightly be compared to the conditions that exist in the countries that have borne the brunt of the fighting. It is not a pleasant thing to contemplate—the length of the war, nor how the issue may leave us but the main thing at its close is to feel that we have done what we could—to know the cause is a just and a right one and to realize that "The strength of all the hosts of heaven is with him who is faithful to the right."

Besides Red Cross or war work I know that you have not let the home or local interests suffer. The causes that called before the war are still with us and must not be neglected and have not been. The improvements introduced into your schools, the assistance you have rendered to promote improvements in your community and your willingness to stand by and lend a hand have all been thorougly appreciated and everywhere I go I hear good words for the achievements of the Women's Institutes. You have kept up your meetings well and faithfully; have settled your own difficulties, only a very few have crept in, that is, to my knowledge, and those few you have overcome with very little difficulty. Don't let us ever lose sight of the big things of life in little bickerings and misunderstandings that will be forgotten so easily that a year's distance will hardly bring a remembrance. Differences are bound to creep in, but let us endeavor to settle them with open

New C. G. R. Time Folder.

The last issue of the Canadian Government Railways time folder appears in a new dress, and an attractive one at that.

On the front cover the words "Canadaian Government Railways" are shown in prominent and distinctive lettering with pronounced initials. A centre design shows a combination of the coat-of-arms of the various provinces, followed by the names of the Intercolonial Ry., Transcontinental Ry., Prince Edward I. Ry., now merged into Canadian Government Railways.

The back cover has a repetition of the name of the railways, the centre design being a striking monogrammic arrangement of the initial letters C. G. R. followed by the principal terminal points, Halifax, Sydney, St. John, Charlottetown, Quebec, Montreal, Cochrane, Winnipeg.

A striking red has been used for the cover, headings and rules, the text being printed in black.

Included in the time folder is a map showing the railways now under Government operation.

Gazette.

PAINS AFTER EATING

WIND IN THE STOMACH—ACIDITY, HEADACHES—CONSTIPATION

ARE SIGNS OF INDIGESTION.

Indigestion—the complete or partial failure of the digestive processes—frequently throws out of gear the whole machinery of the body. You can't enjoy the vigour and vitality of good health unless your stomach, liver and bowels do their work regularly and efficiently.

MOTHER SEIGEL'S SYRUP

As a digestive tonic and stomachic remedy, Mother Seigel's Syrup is esteemed in tens of thousands of homes, wherever the English language is spoken. If you suffer much or little from disorders of the stomach, liver or bowels, try the effect of taking 15 to 30 drops of this famous remedy in water, after meals, for a few days and note its beneficial effects.

Why we Should Prune and the Different Treatment of Old and Young Trees.

(Continued from Last Issue.)

As it is our idea the first few years of a tree's growth to prune for wood, you can readily understand the importance of this first cutting back. To enable us to form a good strong, well-balanced head we must have abundant wood growth and pruning during the first four or five years should be directed towards that end. After that age it will be shown later that our pruning practices are radically changed.

In heading back, head back the strongest branches the most and the weakest the least, in order to give a correct balance to the tree. This may be contrary to the popular opinion, but that is because popular opinion has confused the results of heading back a tree as a whole with the results from heading back separate branches.

This will probably be about all the pruning required the first year, although the tree should be looked at during the latter part of June and if any branch is growing at the expense of the rest it should be nipped back, bearing in mind the one aim to get a stocky and well-balanced growth to select from.

The first real pruning to our newly planted orchard comes in the second spring.

As the tree is to be the modified leader type, it is pruned so that the central branch will maintain the lead, and five other branches at most, will be selected, as previously stated. All other branches are removed and the five selected branches are cut back a considerable distance, cutting the weaker ones the least. As these main branches will probably have some laterals on them, it is advisable to remove these at this time. Now this second year much can generally be gained by adopting a system of summer pruning and continuing both summer and spring pruning for a number of years. By spreading the pruning over two periods like this, the shock to the tree is at on time excessively great, so that it is easy to maintain a correct balance. Furthermore, a whole season can be gained by summer pruning. Early in summer the branches cut back in the spring will have put forward considerable growth. Now as soon as this growth has reached a stage where laterals can be spaced on it, pinch back the branches and you will thus gain a season. It is the common practice to let these terminal growths grow until the following spring when it is found necessary to remove say a foot or more of new wood. This means a waste of energy, for you could have cut back to that same point in summer and would probably only have had to cut off six inches or so of new wood. The idea is to economize in the energy of the tree and relegate as little of it as possible to the brush pile, thus conserving it for use by the tree itself and incidentally gaining a season in your pruning. By the following spring each of the branches pinched back in summer will probably have a number of laterals attached to them. All these laterals but one for each main branch are removed, thus leaving twice as many branches as there were the previous spring. Select, of course, the best spaced and strongest branches in every case.

In selecting these laterals make sure that the lateral is not cut the same length as the main branch, or the result will be weakened crotches.

We now arrive at the summer of the third year after planting and as the trees are well established and in good condition, a considerable amount of new wood should be put forth. This new growth is again cut back, the same as the previous year and new laterals thus forced out. In this way another season is gained by summer pruning practices and we arrive at the fourth spring after planting with a strong stocky tree containing well spaced and well balanced lateral branches. This spring it will only be sirable and cross branches from the necessary to clip back too long or rangy laterals and thin out the undesirable and cross branches from the trees. During the summer little pruning should be done, but attention must be paid to too strong growing branches and laterals, suppressing the strong to give the weaker an opportunity to develop. This practice of milder cutting back and thinning out both spring and summer is followed until the tree reaches the age where it should come into bearing. This age varies of course with the variety and the locality. Our idea up to the present has been to prune for wood growth, now our procedure changes and we prune for fruit. The mistake is often made by growers of continuing the same practices during the bearing age as they did during the frame pruning period, thinking that the methods which have given them such fine and shapely trees should certainly give them fruit, but such is not the case.

Of course a variety like Duchess or Wagener can stand more cutting back at this stage than a variety like Gravenstein or King, the former being weak growers, tending to heavy and early fruiting and the latter being vig-

OLD-AGE COUGH & WHEEZING

There is real relief for the Bronchial troubles of old folks in Veno's Lightning Cough Cure. Quickly it frees the choked-up tubes and air passages, loosens the tough phlegm, and soothes the trying cough. Old age need never be burdened with old coughs, old wheezings, asthma or catarrhal troubles while Veno's Lightning Cough Cure can be purchased at the stores.

Awarded Grand Prix and Gold Medal, International Health Exhibition, Paris, 1910.

There is no opium, morphine, or paregoric in Veno's Lightning Cough Cure, nothing harmful to old or young. Its wonderful curative power is the natural result of its strengthening action on the breathing organs. Each ingredient it contains has definite action on the mucous surfaces of the throat, lungs, and bronchial tubes, and all combine to enhance the effect. That is why Veno's cures where others fail. That is why it has the largest sale in the world. Take it for—

orous growers tending more to wood production. Generally speaking, however, the spring pruning should merely consist of removing cross branches, needless branches and cutting back long barren growths, where laterals are needed, but no regular system of unrestricted heading back should be adopted. This should be supplemented by summer pruning to induce fruitfulness, especially in the varieties which are shy bearers and which take a long time to come into bearing.

Summer pruning for fruit is done at a different period from summer pruning for wood. Pruning to induce fruitfulness is done when the terminal buds are forming on the upright stage will be followed by very little after-growth. In fact if there is much after-growth it is a sign that the pruning has been done too early. This aftergrowth of course may be weak and winter kill, but that matters little for it will not materially affect the balance of the three as a whole. If done at the proper time, however, there will be very little after-growth to winter kill. Pruning at this season of the year, just as the tree is completing its season's growth will cause a thickening of the tissues, and will in this manner very often give rise to fruiting wood, either the following year or the year after, and in cases of bearing trees the remaining fruit buds will be strengthened by such treatment. The amount of wood to remove at this time will entirely depend on the vigor of the branch and may vary from a couple of inches to a foot or a foot and a half in cases of extreme vigor and tendency to wood production.

After a tree has been successfully brought into full bearing the pruning should be annual, not spasmodic. Pruning at long or irregular intervals is bound to upset a tree, whereas annual pruning will keep the tree in proper balance, for the amount of wood removed will be very small. The only pruning necessary in such cases will be to cut out bad limbs, crossing limbs and now and then do a little thinning.

Sumarizing our remarks so far then we find that during the first five or six years of the trees life we prune for wood, to get a good strong frame and a desirable form for the tree. During the next few years we prune to induce fruitfulness, changing our tactics and object entirely. During the balance of the tree's life we prune to maintain a proper balance in the tree and thus maintain its profitable fruitfulness. Our sole object in pruning therefore is to produce better fruit than we could produce without pruning practices.

This brings us to a discussion of how best to remedy some of the undesirable conditions existing among the older orchards. In the first place the trees are planted too thickly and it will positively be necessary in a great many cases to take out every other diagonal row to permit the trees to spread out and present their fruit bearing area to the sun. You cannot expect to grow good fruit in a forest. It is not sanitary and all the efforts in spraying are put at naught by those close orchards. Not only are the orchards too close, but by being so close planted the trees have been forced to go skywards until there is practically no fruit borne on the lower parts at all, the lower portion of the tree merely being used to support a few long branches of fruit at the top. It is impossible to spray such trees. You cannot reach them, in fact in many cases you cannot poke a spray rod up through the canopy of trees.

To remove every other row then is the first step. If the owner does not care to do this at once, a plan of the orchard should be made and the condition of each tree marked on the plan. In this way the best trees can be selected and a plan of removal adopted whereby the largest number of good trees are left. The condemned trees may then be severely headed back to give the permanent trees more room, and in about two years the condemned trees, now reduced almost to barren poles, can be removed. An additional crop of apples may thus be removed from these condemned trees while the others are filling in their increased area.

The result of this close planting will be what are termed long, barren arm trees. That is trees with long, barren arms supporting a little brush at the top.

These trees need to have the tops cut back to induce lateral growth to start on the barren arms.

Such severe heading back will induce much new growth, in fact it will cause a rejuvenation of the tree and although the new growth may appear excessive, it can, if properly selected and thinned out, be made to completely transform the tree.

Sucker growth or water-sprouts will be abundant in many cases and should not be despised, for by selection and heading back these can soon be made into bearing wood.

Of course with such varieties as Baldwin, headed back severely during the year when it is not fruiting, this growth may be very abundant, thus necessitating a very severe thinning out.

In contradistinction to the barren armed tree we have the very thick, but high, neglected tree. This tree will need to be thinned out first, then headed back and kept thinned out by summer pruning, which will lessen its tendency to reproduce the wood removed.

It is easy to tell a tree which besides needing to be lowered so that it can be sprayed and worked with properly, needs also rejuvenation. The annual new growth on such a tree will not exceed an inch or two. It does not make enough annual growth to keep a good continuation of fruit buds on the go.

In the case of very high trees where considerable heading back is necessary, it will porbably be better to do it by installments, and in many cases it will be advisable to leave the bottom branches intact and thus reduce the shock.

In making such large cuts as these dehorning practices will require, attention must be paid to a few points. In removing large limbs make the first cut at a point several inches from where the final cut is to be made and on the under side. Carry this cut about half way through, then cut through to meet it from the upper side, starting the upper cut about two inches farther out. Afterwards remove the stub supporting it while cutting, so that no bark splitting will result. Cut back to a good lateral branch and make the cut close to that branch. All wounds of any size should afterwards be made pointed at both ends.

Wounds over two inches in diameter should be treated at once with some coating to keep out disease and the weather. A good application of paint is satisfactory for small wounds, but will not suffice for larger ones; shellac is better for these. Many growers use coal tar, although it is claimed that it causes some slight injury to the cambium. The users of it, however, claim that this injury is not serious enough to consider and that it is the best and cheapest covering for large wounds. Large wounds should receive constant attention until healed over, and if this is given no evil result will follow from such dehorning practices.

Address by M. B. Davis, assistant hortilculturist, Ottawa, before the Nova Scotia Fruit Growers at Wolftville, January, 1916.

SERVICE

THE THIRD BRANCH OF BUSINESS

There was a time when business consisted of but two branches—buying and selling. They were fundamentals, of course, but they were the only fundamentals recognized. We have added a third great branch. We call it SERVICE. It goes into every transaction we have, and stands back of every vehicle we make or sell. It's your guarantee of QUALITY, PROMPTNESS AND SQUARE DEALING.

You will receive the benefits of this service when you buy from a dealer in Nova Scotia Carriages.

If there is no dealer near where you live, and you are in need of anything which we manufacture, we would appreciate a letter from you and would be glad of the opportunity to serve you by arranging for our nearest dealer to call upon you.

The Maritime Farmer

SUSSEX, N. B.

Education For Country Life.

(Continued from Page 277).

the Teuton menace as we call it, our country gives our soldier boys a year or so of the intensest sort of training at great cost. For the farmer's fight there is need too of special training.

As a raiser of animals, he feeds and breeds, uses them in his work, watches and tends, protects and nurses, selects and rejects, buys and sells. As with plant life, so with animal life there are a multiplicity of forms and cares. He has horses, sheep, cattle, swine and poultry. They require attention and care not in groups but as individuals. While they constitute the machinery for turning his crops into merchantable forms they are not inanimate things. They are living partners wtih him in his business. There are personal relations with them. They work for him and he works for them. They have enemies and diseases and he must defend and minister unto them. They have their appetites and special requirements of food, he must satisfy these. If skill and vigilance an dendurance are needed in the production of good crops, intelligence and love are needed in the farmer's work of raising animals.

From the accounts given of his work as a laborer and agriculturist, it may readily be seen in the third place that he must combine in a remarkable degree the functions of a Mechanic and Scientist. The work of the farm becomes more and more the work of a skilled mechanic. The farmer must be very largely his own carpenter and builder, mason and cement worker, blacksmith and tinsmith and plumber, painter and glazier. He should be an all round expert equipped to perform the commoner tasks pertaining to a dozen different trades.

On that side of his work in which science plays a part, there are manifold requirements also. For the best kind of intelligent work—and there should be nothing but this kind of work on the farm—he requires at least elementary knowledge of the sciences of botany, zoology, physiology, physics, chemistry and meteorology; not in the manner that the secondary schools of the country teach them at the present time, but in their intimate application to weeds and weed seeds, insects and plant diseases, domesticated animals, soils, drains, fertilizers and manures, rainfall and frost, fruit growing and grain growing, the laws of breeding and the principles of feeding. Farming is an art, agriculture is a rare complication of sciences. For these there must be found teachers.

In the fourth place, the farmer is a business man. He is more too than the owner of a small business; he is the manager of a big business. He employs labor and he uses capital. He buys and sells, he bargains and trades, he borrows and loans, he mortgages, he banks, he transmits money, he forms joint stock companies, or co-operative associations. He has the most intricate business in the world. No expert has ever yet worked out a satisfactory system of book-keeping for him. It is easy enough to keep track of the business of a bank or a railroad or a grocery store, but how is one to keep accounts for the soil, for manures, for feeds and for the intricate labor of the farm? And yet he is told he should keep books!

In the fifth place, he functions as a citizen. And a most important part of the citizenship he is. From the country come the builders of our cities, the founders of industries, the leaders in professional callings. A sound rural citizenship is the first requirement of stable governments and democracies. Potriotism is nurtured in the soil. Indirectly our leadership has its source there.

And as a citizen of the highest type he must be intelligently zealous for the four institutions that secure for the state its well-being, viz.: the Home, the School, the Church, the Government. To these he has exacting obligations. He will express his highest sense of citizenship as he stands for good homes, for the best educational oportunities, for morality and for clean and unselfish politics.

Thus we see the six-fold nature of the farmer's requirements in education, viz.:

Laborer, Agriculturist, Mechanic, Scientist, Business Man and Citizen. And what has been said about the man of the farm might be detailed in many similar respects for the farm woman.

(Continued Next Issue.)

Record Prices for Grade Holsteins.

At the dispersion sale of the show herd of the Carnation Stock Farms at the close of the San Francisco Exposition, December 1st and 2nd, grade Holstein cows brought probably the most remarkable prices ever recorded at any grade sale in the United States. One grade Holstein cow, Carnation Queen, was picked out by Auctioneer Gue, of Washington, to be the finest individual Holstein cow in the herd, and at the close of the first day he gave a lecture illustrating the qualities to be sought, by using Carnation Queen as the ideal Holstein cow. She was placed on sale the next morning, and there was spirited bidding among five different parties for this cow. She was finally knocked down to a millionaire living south of San Francisco for $505, which makes her the highest priced Holstein grade ever sold at public auction.

Another Holstein grade was sold at $300 and many brought over $200 each. We understand that the entire herd of grade cows averaged the Carnation Stock Farms $250 apiece, but they were a selected lot of several of the leading grade herds in the state.

In speaking of this, Mr. Harold McAlister says: "We happened to see several of the grades last summer that were milking over 80 pounds per day, or about five gallons (wine measure) to the milking.

When Holstein grades can command such prices and give such enormous quantities of milk, it is a great encouragement to farmers with grade herds, as to what can be accomplished by the use of purebred Holstein sires in a few years."—W. A. Clemons, Secretary, Holstein-Friesian Association.

Realize the Value of Your Farmyard Manure

Of course you use all your stable and stall manure—sometime or other. But does it first lose its value by leaching and firefanging?

Everything Depends on How it is Used!

Bulletin 223, issued by the Ontario Department of Agriculture, proves the importance the Department places on farmyard manure, and how it is used.

There is a book published called "Helping Mother Nature, The Value of Manure and How to Utilize It." It's a revelation of how much a farmer can add each year to his profits. It will help every farmer who reads it. We have reprinted it (six chapters) for FREE distribution.

First thing you do, cut out the coupon below, fill in your name and address and mail to us. By return of mail you will receive a copy of the book that will make you see manure in a new and profitable light.

The Great Aeroplane Sled and a Guaranteed Watch

A motor drives the propeller, the propeller drives the sled. Result: SPEED, SPEED, SPEED. Doesn't need a hill to go down. Travels on the level.

Absolutely safe for boys. Perfect motor. Speed thirty to sixty miles an hour on level ground. Length of car, 84 ins. Strong construction.

B5

Over the ice a mile a minute. THERE'S the sport! Racing down the wind like a bird a-wing, cheeks glowing, nostrils dilating, every nerve tense with the thrill of the newest, most exhilarating outdoor sport—Aero-sledding. No waiting for favorable winds; you control the speed—the direction—as easily and comfortably as from the seat of the finest racing automobile. The Aero-Sleds are driven by real aero motors and propellers. They don't fly in the air, but they do fly along the ice at a great speed. They are as easy to control as an automobile, and as steady. Boys and girls with rich, red Canadian blood in their veins can drive them easily. In summer you put wheels on and run it on the ground. They are strongly constructed; have three steel runners; have seats for two; genuine aeroplane gasoline motor and guarded propeller, and strong steering gear. Hey! boys and girls, here's the sport! And besides the great Aero-sled you can secure, also absolutely free, a magnificent watch, guaranteed for one year. This is a watch any boy is proud to own.

Live Canadian boys and girls, here's your chance to get both the Watch and the Aero-sled absolutely free. Just send us your name and address. We want you to help us advertise and increase the demand for our new double-strength mint chewing gum, put up in big packages—and sells at 10c a package. Our gum sells like wildfire because every purchaser gets free a $2.50 certificate entitling them to secure a copy of the great patriotic picture in full color "The Story of His Brave Canadian Father, [illegible]. Everybody wants a copy of this wonderful [illegible]. We will send you one free to show you [illegible] and we will send you postpaid and trust you with only 35 packages to distribute at 10c a package and 35 certificates to give away with each package. As soon as you have sold them return us $3.50. You will receive [illegible] as a reward for your work the magnificent Watch and the Aero-Sled as [illegible] without selling another cent's worth of goods. Just by sending us the names and addresses of eight boys who would like to have our fine premiums too and who will be our agents and sell our goods. Send your name to-day to

Use MILBURN'S LAXA-LIVER PILLS

FOR A SLUGGISH LIVER.

When the liver becomes sluggish it is an indication that the bowels are not working properly, and if they do not move regularly many complications are liable to set in.

Constipation, sick headache, bilious headache, jaundice, heartburn, water brash, catarrh of the stomach, etc., all come from a disordered liver.

Milburn's Laxa-Liver Pills stimulate the sluggish liver, clean the coated tongue, sweeten the obnoxious breath, clean away all waste and poisonous matter from the system, and prevent as well as cure all complaints arising from a liver which has become inactive.

Mrs. John V. Tanton, Birnam, Ont., writes: "I take great pleasure in writing you concerning the great value I have received by using your Milburn's Laxa-Liver Pills for a sluggish liver. When my liver got bad, I would have severe headaches, but after using a couple of vials, I am not bothered with them any more."

Milburn's Laxa-Liver Pills are 25c a vial, 5 vials for $1.00, at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

America's Pioneer Dog Remedies

BOOK ON
DOG DISEASES
And How to Feed
Mailed free to any address by the Author
H. CLAY GLOVER, V. S.
118 West 31st Street, New York

Safety first in Feeding.

Two feeds that should be handled with care by hog raisers are wheat bran and cottonseed meal. The bran is all right for old hogs and well-grown shotes, but young pigs sicken on it, if much is given. Cottonseed meal is poisonous, often to a fatal extent, to all ages of hogs. I have known some men to feed it successfully, but they gave very little of it, and said that it was risky, unless one had had long experience with it.

There are two reasons why it is desirable to feed concentrated hog rations mixed with plenty of water, so as to make a thin slop. First, it has been proved both by experiment and practical observation that hogs often do not take as much water as they need for full health, especially in winter when their water supply gets cold. Giving a lot of it with their feed saves handling and makes sure of their taking it. Second, it seems to be the nature of a hog to want feed that is not only nutritious, but filling. The water bulks out the feed and leaves the hog with his digestive apparatus comfortably distended. It is best, of course, to give some bulky feed also, for the same purpose.—G. B. Hill.

Retained Portion of Foetus.

Farmer.—"Cow retained parts of a calf from calving time, over twelve months ago. She is now in good condition and fat. Is there any reason why she may not be butchered? Is there any objection to putting her on the market?"

Answer—This condition is often met with in cattle practice. In some cases the cow will again conceive and bring forth a healthy calf. These cases are generally discovered when the cow is slaughtered for beef. The foetus or a portion thereof is found in a mummified condition, or perhaps only the bones, hoofs or hair may be found. The flesh is good for human consumption."

A few Pointers on Manure Handling.

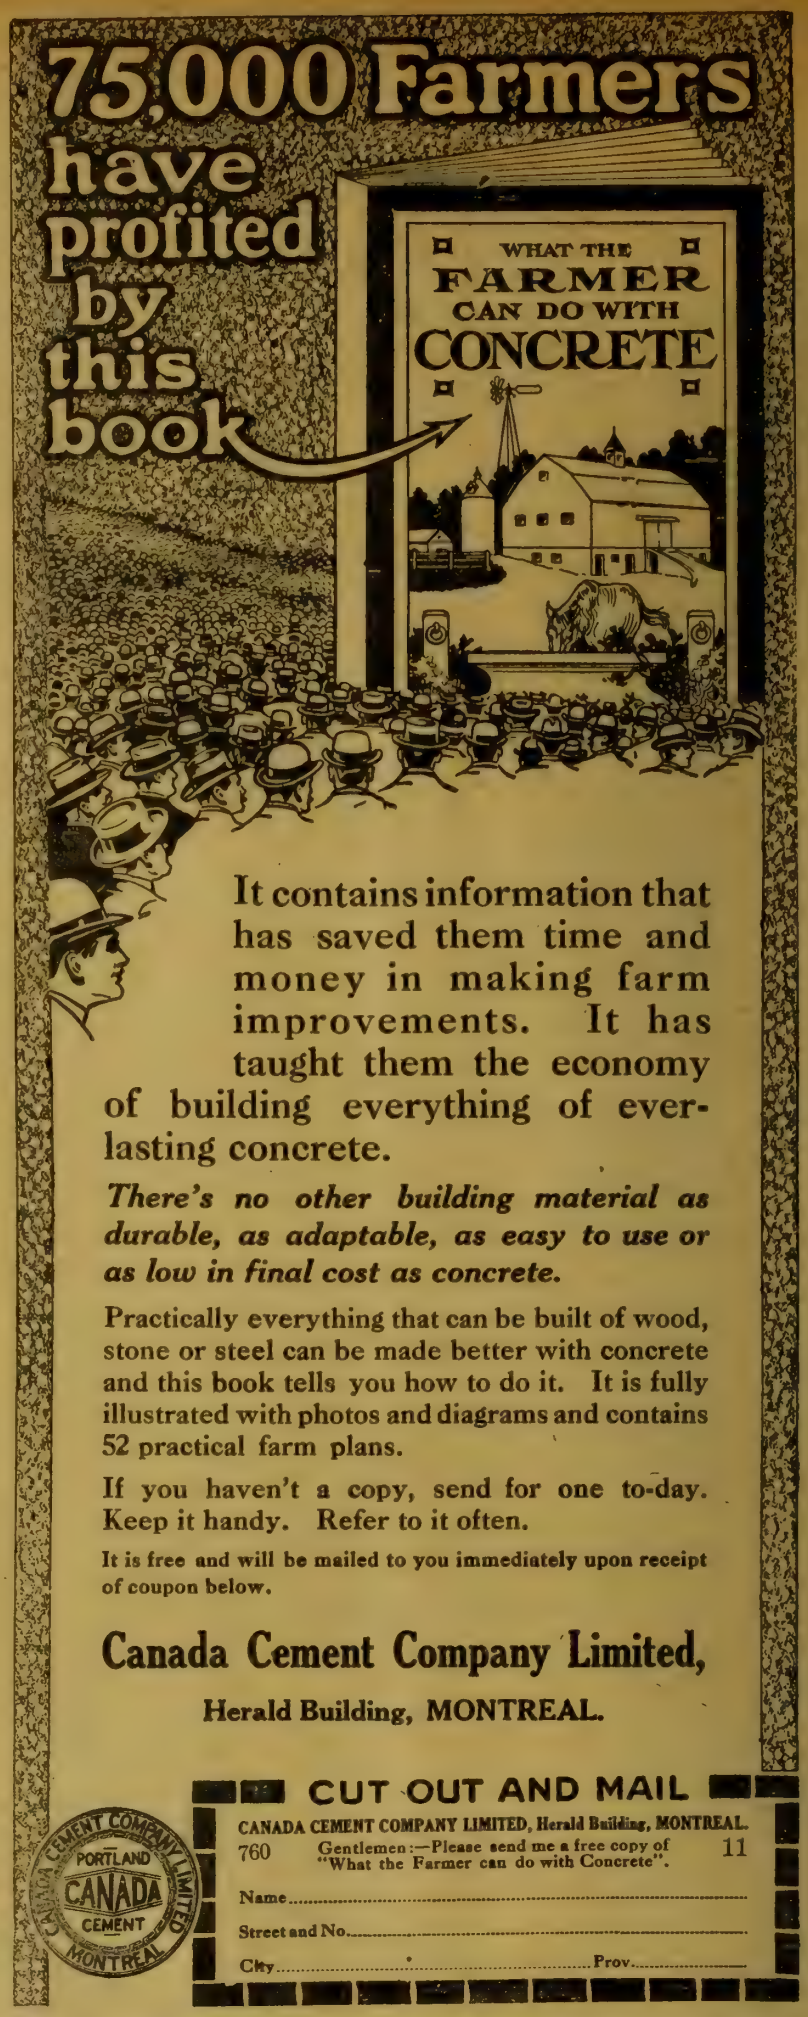
Never permit fermentation or superheating, of manure. It is easy to lose one-half of the original value of a manure heap in a few months if it becomes fire-fanged.

In this country we have less loss through leaching than is the case where winter rains prevail, but a manure pile under the eaves of a building may easily lose heavily from this cause.

Remember that the urine, or liquid portion of the fertilizing elements voided by animals. Do not bore holes in stable floors to facilitate the escape of this portion, but rather use bedding to absorb it and carry it to the land.

To the Hen—Oh, Lovely Hen.

Alas, my child, where is the Pen
That can do justice to the hen?
Like Royalty, she goes her way
Laying foundations every day
Though not for Public Buildings, yet
For Custard, Cake and Omelette.
Or, if too old for such a use
They have their fling at some abuse,
As when to censure plays unfit
Upon the stage they make a hit,
Or at elections seal the fate
Of an obnoxious candidate.
No wonder, child, we prize the Hen,
Whose egg is mightier than the Pen:
—Selected.



It contains information that has saved them time and money in making farm improvements. It has taught them the economy of building everything of everlasting concrete.

There's no other building material as durable, as adaptable, as easy to use or as low in final cost as concrete.

Practically everything that can be built of wood, stone or steel can be made better with concrete and this book tells you how to do it. It is fully illustrated with photos and diagrams and contains 52 practical farm plans.

If you haven't a copy, send for one to-day. Keep it handy. Refer to it often.

It is free and will be mailed to you immediately upon receipt of coupon below.

Nova Scotia Institutes

(Continued on Page 303).

minds, willing to forget self and willing to consider the other person. I don't know that I was ever a very ardent follower of the admonition to "turn the other cheek" but I am a firm believer in the efficacy of "A soft answer turneth away wrath." George Eliott said, "When Death, the great reconciler has come, it is never our tenderness we repent of, but our severity." Let us remember that the only way in which true happiness comes is through service—service in the home, service in the Institute, service in the community, service for our country. "A poor man saved by thee shall make thee rich, a sick man helped by thee shall make three strong. Thou shalt be served thyself by every sense of service which thou renderest."

That then is what the past two and a half years have brought of achievement of which you have a right to be proud. What of the future? I have no fear of that. I have the utmost faith in my women and here this morning when we are by ourselves, I want to say to you that I am of Scotch blood and it's "unco hard" for the Scotch to tell out loud anything about his or her inmost feelings, but I am just simply overwhelmingly proud of you all, glad that I happened to be the person to know all the goodness of you, all the kindness of you, all the dependability of you, and if the time ever comes when I have to resign, I know I shall be jealous of anyone going in and out among you—no matter how much more suited that person may happen to be for the work than I. The future should, however, be more productive of good than the past because we have the added facilities given us in this splendid new building with its up-to-date equipment. Already we have requests for Short Courses of longer duration than the present one and we will be ready to arrange for one whenever twelve or more persons request it and we want to make the attempt before spring brings its busy season. Give me your co-operation and assistance, talk it over in the Institutes. This building is for you and if you desire to have good practical courses in Household Science and its allied subjects, remember, ladies, you have but to make that desire apparent.

I hope that you will find this Convention helpful in some way to your Institute and to yourself, and if for nothing else, that you may go home feeling refreshed in body and mind for the little trip to Truro. I am glad you came, sorry that there were not more of the Institutes availed themselves of the oportunity of sending delegates. The main thing after all is that you may get some help from this Convention, however small, and a convention is a good deal like life—we get back from life just whatever we put into it—and so in a way do we get back from a convention, perhaps not so much from what we put into it as the spirit in which we approach it, and I think that a spirit of helpfulness and encouragement is with us during these days, and we can cultivate no better spirit at any time or in any place.

Take back to the Institutes my sincerest good wishes for the New Year on which we have just entered. May it bring happiness and prosperity in rich and abundant measure not only to the Institutes as a body, but individually to each member.

"Now blessings be upon your house,
Your roof and hearth and walls;
May there be lights to welcome you
When evening shadow falls;
The love that like a guiding star
Still signals while you roam,
A book, a friend—these be the things
That make the house a home."

A Fish Day.

February 29th.

(Canadian Fisherman).

This is a leap year. One more day is added to the calendar, one more working day means a lot in economic value. It means more wealth for distribution, more savings for the thrifty, more knowledge for the student, more ideas for the intellectual, more value all around added to the year. It is our duty to make the most of this extra day.

In our particular sphere of action, could not something be done to enhance and promote the interests of our industry? It strikes me that this particular day of this leap year, February 29th, should be a fitting occasion to inaugurate a day, which would be known in the years to come as, the Fish day of the Dominion. It is said "Every dog has his day," and why should not the fish have its day? To that effect I propose most earnestly that after this year, our Association, at its general meeting, should decide the date of an annual Fish Day. I believe, however, that it should take place during the month of February. Firstly, because in the abstract the month of February in the calendar year is under the sign of the Fishes—this appeals to the imagination.

Secondly, it is during this month that as a rule the Lenten season commences, and we all know the concrete influence of this season on the fish trade.

Thirdly, at this particular period of the year, stocks of all kinds of fish have accumulated in great variety and it affords a greater choice to select from. It is also the period of cold weather when Fish can be conveniently and more safely carried and distributed.

The fish day that we wish to inaugurate should not be merely an occasion to make speeches, to read papers, or to comment on the operation of the Naval Service Department, and revise the statistics. It should be a day of action, and the slogan, "Eat Fish, more Fish and plenty of it," should be more in evidence than ever.

It should be a festival of good cheer, bon viveur, after the style of the old mythological feasts, so that a fat salmon buried in crisp Boston lettuce adorned with thin slices of juicy lemon, cucumber and other tasty seasonings would become as significant, to us, of good things, as Bacchus crowned with vine leaves was to the ancients. Or our Fish Day might be a repetition of those Fairs of more modern epochs. The part of the trade in this festival would be to make a great demonstration by the Fishermen, an exposition of the riches of our prolific waters, decorated with bunting, mottoes, inscriptions; even illuminating signs should be displayed at every market and business place.

There should be everywhere an atmosphere of bustle and activity, so that hesitation to participate for the good influence in this festival would be impossible. In the public demonstration new adherents to the cause would join by myriads. But to make the Fish Day a success and to implant the idea securely in the hearts and minds of our people, it is necessary to give it a wide publicity. From the Arctic Sea to the Great Lakes, from the Atlantic to the Pacific, the press of our country should proclaim the advantages and merits of Fish as a food. Every member of our Association should do his share of advertising in this connection. It is also the duty of each one of the Executive not to share efforts but to co-operate fully with the press and give all attention to the movement.

I say also that our Provincial and Federal Governments, our Transportation and Public Utilities Commission, should throw all their influence to bear upon a subject which is interesting and concerns every citizen of Canada. After all the Fish Day will be a stimulant and a means to develop one of this country's best assets. It is also a patriotic effort in every sense of the word.

Our Fish industry is not less precious than our Mines, our Forests, or our Agricultural Lands, and really a good deal less has been done to develop the Fish industry.

For many reasons our fish industry should receive more encouragement, as it is a better asset for our country than any of the other industries. All that is necessary is to exploit the fish—nature constantly replenishes the losses without any cost or effort to the exploiter.

In the case of our mines, after the ore is taken out, nothing of any value is left. It takes one hundred years to replace the growth of a forest that has been cut, and if farming could be done without tilling the soil, planting the seed and fertilizing, it would then be on the same footing as our fisheries.

And as regards food products, crops will fail, disease will spread and annihilate cattle, but no famine is possible with our fisheries, and the more we develop them the more valuable they will become. So a Fish Day every year is imperative. We must at all costs get the public interested in the development of our fisheries.

Let everyone be ready, then, for the next 29th February, the first Fish Day to be celebrated in this country.

Community Breeding.

A uestion that is commonly asked by dairymen is what breed shall be selected. Before making a choice as to any breed it is well to consider the matter from the community standpoint. Instead of selecting a breed not represented in the community, it is far better to develop a herd of the same breed as already predominates in that locality. Among the advantages of such a system may be mentioned the sale of surplus live stock.

In the older dairy sections the sale of milk products are but a part of the profits derived from the industry as the sale of the surplus stock has become an important factor. The demand for dairy cattle throughout the country is very strong and there are certain districts that are known as Guernsey, Holstein or Jersey countries and to these countries buyers from long distances come knowing that they will be able to find what they wish to purchase. In these sections where one breed predominates, community breed associations are formed, where the subject of breeding is studied and the members a erstimulated to take advantage of their opportunities.

By this co-operation, the cost of advertising, official testing for advanced registration is lessened and material advantages are obtained in the buying of feed, the marketing of their dairy products an dthe fighting of disease.

It is of great importance in regard to breeding animals. It is a well-known fact to dairy breeders that high class bulls are relatively scarce. Many valuable sires have been lost before their owners realized their worth. By trading bulls through the medium of a community association it is becoming possible to retain the best bulls in service, not only reducing the expense for this purpose, but also makes wide use of the blood that is found to sire especially meriterious animals.—Prof. E. V. Ellington, Idaho Experiment Station.

Cribbing or wind sucking is a vice, not a disease, and cannot be cured by medicine. Applying a mixture of red pepper and soft soap, or better still, aloes, around the stall will sometimes stop this habit.

Stumps Out—Quick and Easy

Here at last is the land clearing device you have been looking for—the Kirstin One-Man Stump Puller—a simple, powerful, practical Puller that one can handle and operate with ease. No big, expensive, cumbersome outfit—no horses to drive—no extra work of any kind. With the Kirstin, one man *alone* clears land quickly, easily, economically. Costs little to begin with—nothing for upkeep—and costs far less to operate than any other hand or horse power puller on the market. In the

Kirstin One-Man Stump Puller

you get every quality needed for land clearing—*strength, power, speed.* The Kirstin is the only stump puller with variable speeds. This gives you a big advantage—saves much time. To start the tough stumps, you have enormous *power:* then when the stump breaks loose, a turn of a wrench gives *greater speed.* Any and all kinds of stumps—big, little, green, dry, tough—also trees and hedges—are pulled quick and easy. The Kirstin holds the record for lowest cost of operation. Prove our claims by

Ten Days Try-Out on *Your* Farm

With the Improved Double Leverage Kirstin you can clear over an acre from one anchor. Also no time wasted in frequent re-setting of puller. The Kirstin is designed to save time. When you get a Kirstin you get a complete, practical Stump Pulling Outfit *at little cost*—and you are protected by the *Kirstin Iron-Clad Guarantee.*

The Kirstin can be used anywhere—on hillsides, in swamps and on rough ground or in thick timber where no other puller could be used. The Government uses Kirstins—so do several of the State Experiment Stations—and thousands of land owners from Maine to California and from Canada to the Gulf are loyal boosters for the Kirstin because it has **demonstrated its superiority** as a land clearing device. If you have only a couple of acres of stump land you can't afford to let it lay idle. Get a Kirstin now—clear out those stumps—make your idle land pay you a profit.

Get the Kirstin Catalog—Today!

Any one having stump land should get this valuable free book at once. It tells all about the wonderful Kirstin One-Man Stump Puller, the Kirstin Service Bureau, the Payment Plans and fully explains easiest, best, cheapest way to clear your land.

IF YOU HAVE LIVE STOCK FOR SALE ADVERTISE IN THE MARITIME FARMER.

One Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only 1 cent a word, you can advertise anything you wish to buy, sell or exchange. The aderess must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issle. No black faced type or display of any kind will be allowed under this head, thus making a small add as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, Sussex, N. B.

FOR SALE.—A pure-bred Percheron Stallion, three years old.—LEO. A. MILLER, Linville, Car. Co., N. B.

VALLEY FARM HOLSTEIN OFFERING—One pure bred Bull, dropped last February, also one Heifer Calf, three weeks old.—W. G. CAMPBELL, Salisbury, N. B.

JERSEYS, A. J. C. C. REGISTRATION FOR SALE.—Bull, 7 months; two heifers, 14 and 16. Prices reasonable.—J. F. HALL, Lunenburg, N. S.

FOR SALE.—Bronze Turkeys, large, healthy birds of Bell strain, bred from prize winners. Toms, $7 00; hens, $4.00. Only a few left.—HOTEL DIEU FARM, Chatham, N. B.

YOUNG PIGS FOR SALE.—Purebred Berkshires, registered; Purebred Yorkshires, but not registered. Also Berkshires and Yorkshires crossed.—R. O'LEARY, Richibucto, N. B.

PURE BRED JERSEY COW.—I have for sale this cow of extra good butter and milk qualities. Freshens February 10th. For particulars by mail apply to C. FRED FAWCETT, Upper Sackville, N. B.

JERSEY BULLS of good type, ready for service, also Bull Calves, all from good producing stock. In Berkshires one Boar, 2 years old; one Sow and young Sows from 6 to 8 weeks.—J. R. SEMPLE, Tatamagouche, N. S., R. R. No. 1.

"VOL-PEEK" MENDS pots, pans, buckets, boilers, graniteware, tin, aluminum, in two minutes, without tools. "Put it on with your finger," enough to mend 50 holes 25c, postpaid. Agents wanted everywhere.—H. NAGLE, Montreal.

WANTED.—Ladies to do plain and light sewing at home, whole or spare time; good pay; work sent any distance; charges paid. Send stamp for particulars. NATIONAL MANUFACTURING COMPANY, Montreal.

FOR SALE.—One Jersey Bull, four years old, sure getter and quiet. Offspring of a cow and bull brought from Hood's Farm by Jordan.—R. W. JONES, Steeve's Mountain, N. B., via Boundry Creek.

FOR SALE.—One pure bred registered Guernsey Bull, now 23 months old. This Bull is a first class individual and unites the best strains of the Corning and Roper herds. Well suited for an agricultural society or private herd. Price reasonable.—W. E. READ, Bear River, N. S.

FOR SALE.—Black Percheron Stallions, have two foaled 1903. Both imported, weigh 18 hundred each and are two of the best stallions in New Brunswick. They have colts here and lots of mares in foal. Will sell one of them. Also have an imported Clyde Mare, 7 years old, which I will sell.—WARREN C. BULL, Woodstock, N. B. R. F. D. Route 4.

PURE HOLSTEIN BULL CALF (registered) FOR SALE—Age 3 months, nicely marked, weighed 115 lbs. at birth and now weighs nearly 300 lbs. Sire was twice Canadian National Champion. Dam winner of her class at St. John, 1914, and a big milker now in R. O. P. test. This combination of size, constitution and production makes this Bull Calf a sure herd improver. Apply J. H. STOCKTON, Bull's Creek Farm, Woodstock, N. B.

FREE, to stockmen and poultrymen our 80 page illustrated booklet on feeding; how to construct a house which will accomodate 100 hens; gives dimensions and measurements of every piece of lumber required. Deals with the common diseases of stock and poultry and the remedies. Tells how to cure roup in four days. Contains full information about Royal Purple Stock and Poultry foods and remedies.—THE W. A. JENKINS MFG. CO., London, Canada.

Fall Clearing Out Sale

First prize Registered Holstein Bull over two years old, $100.

Two Registered Yorkshire Sows over 7 months old, best bacon type at $18 each

20 Big Barred Rock Hens, $1.25 each; Roosters, $2.50.

20 Beautiful Pure Bred White Wyandotte Hens, $1 25 each; Roosters, $2.50.

Massey-Harris Root Cutter, cost $15, price $7.00.

Mixed Breed Hens from free range, soon laying, 75 cents each.

Percheron Stallion
GLENEUR
FOR SALE !

The Imported Percheron Stallion Gleneur has stood for service in and around Sussex for five seasons, where his get are in demand at the highest prices paid for draft horses in this vicinity. He must now be sold in order to make room for another horse to mate with his fillies. His get are active, trappy fast walkers and great workers.

Gleneur is a dappled grey, weighing 1750 lbs., is nine years old, gentle and a sure stock getter. Guaranteed sound in wind and limb. If you want to buy a stallion that will improve the quality of live stock in your district and prove a good investment for you, make inquiry about Gleneur before you place your order elsewhere,

Wm. Jamieson, - - Sussex Corner, N. B.

R. O.M. and R. O. P. Holsteins

Would you like to get a good foundation? Holsteins of this calibre are seldom offered at any price, but we are overstocked and will offer::—

2 Daughters of "Ruby Nig" whose 7 day record is 567 lbs. milk, 25.60 lbs. butter; yearly record, 16,555 lbs. milk, 750 lbs. butter; the second highest record in Canada at 3 years of age.

2 Daughters of "Black Rose Beauty" whose record is 522 lbs. milk, 24.60 lbs butter in 7 days.

2 Daughters of Miss Rooker Posch, whose record is 402 lbs. milk, 16.114 lbs. butter in 7 days; 12,268 lbs. milk, 600 lbs. butter in one year, when 3 years old.

2 Daughters of Beauty Rooker, whose record at 2 years of age is 322 lbs. milk, 15½ lbs. butter in 7 days; 11,248 lbs. milk, 517 lbs. butter in one year.

And several others of equal breeding, sired by or bred to "Ida Rooker 2nds Vale," a sperior animal in every way and a proven producer of rich milkers. Also some extra nice bulls of the above breeding, all at reasonable prices.

LEA & CLARK, Victoria, P. E. I.

ELMHURST SHORTHORN STOCK FARM

Present Offerings—Six exceptionally good red and roan bulls, 10 to 18 months of age, from superior milking dams. Write me for prices and particulars before placing your orders elsewhere.

C. C. H. EATON, - - - - - CANARD, N. S.

HOLSTEIN BULLS AT BARGAIN PRICES

Two pure-bred, but not registered, Holstein Bulls, 16 and 18 months old, in excellent condition, fit for service. Just right for farmers who have only grade herds and wish to improve. These bulls will be sold at bargain prices. Write quickly if you want one of them.

A. HECTOR CUTTEN, - Inglewood Farm, Lower Truro, N. S.

Bargains in Ayrshires.

Owing to having a large milk contract to fill, I find it necessary to dispose of young stock and offer: One Bull Calf, dropped Dec. 10th, dam qualified in the R. O. P. test as a two-year-old, with 8,880 lbs. milk and 363 lbs. butter fat, also Heifer Calves from dams now under test. All sired by Spring Bank Roger, his dam having qualified in R. O. P. with 11,365 lbs. milk, 511 lbs. butter fat, as a four-year-old.

T. J. HAWKINS,
Stewacke, N. S.

Valley Farm Holstein Offering

One pure bred Bull Calf, dropped last February.

Volume 21. SUSSEX, NEW BRUNSWICK, FEBRUUARY 22, 1916. Number 10.

ORCHARD FERTILIZATION

Address by Prof. W. Saxeby Blair before the N. S. Fruit Growers' Association.

Since our fertilizer supply is being shut off owing to the War it seems desirable that we should modify our orchard parctices in order to meet conditions as they exist. With an unlimited supply of potash at a reasonable rate we have little need to worry about the potash requirements of our orchards, in fact in many cases probably more potash than actually necessary has in the past been used. This, however, does not say that we can do without this element in years to come. The hope is that the shortage in this fertilizer is only temporary. Nitrogen also has in the past been reasonable as compared with present prices of $70.00 per ton for nitrate of soda which last year cost us only $50.00. The various phosphotic fertilizers have also advanced.

An acre of apples producing 100 barrels according to analysis will take from the soil aproximately as much nitrogen and phosphoric as an acre of wheat producing 15 bushels, and about 3 times as much potash.

	Apples.	Wheat
Nitrogen	33	33
Phosphoric Acid	7½	10
Potash	45½	16

Experiments have shown that a fertilizer carrying 30 lbs. nitrogen, 50 lbs. phosphoric acid and 50 lbs. potash should be furnished to a full bearing orchard annually. It will be noticed that the phosphoric acid called for is much in excess of the amount the plant requires according to analysis, but in actual practice it is found that plants generally require an amount of phosphorus in excess of that called for from a chemical analysis of the product grown.

Considering the fact that nitrogen is one of the most important fertilizing elements it is well for us to see that we are making the best use of the means at our disposal to obtain all of this element we can from the air by growing leguminous orchard cover crops. An analysis of the various cover crops in their green state gives a comparative idea of their fertilizing constituents.

	Common Vetch, ready to bloom	Peas 2 to 3.	Crimson.	Red Clover.
Nitrogen	.65	.45	.43	.41
Phosphoric Acid	.14	.11	.13	.13
Potash	.47	.36	.49	.45

It will be noticed that according to this the crops ran fairly uniform in their green state.

Experiments conducted at Ottawa gives the following comparative values of the different leguminous cover crops seeded July 13th, and collected October 20th.

	Weight of crops per acre tons.	lbs.	Nitrogen. per acre.
Mam Red Clover stems and leaves.	6	1310	82
Mam Red Clover roots	3	1200	48
Total	10	570	130
Common red Clover stems and leaves.	4	1779	70
Common red Clover roots	2	1445	47
Total	7	1224	117
Crimson Clover stems and leaves.	11	234	85
Crimson Clover roots	3	201	19
Total	14	435	104
Hairy Vetch, stems and leaves	11	1895	129
Hairy Vetch, roots.	2	345	18
Total	14	240	147

The common vetch was not grown for comparison in this test but the chances are that it will compare hardly as favorably as the hairy vetch, but better than crimson clover.

That the turning under of such a cover crop does supply a large amount of nitrogen which is taken from the air is shown by tests conducted by following grain on land which had previously been in grain with which red clover had been sown as compared with adjoining plots not seeded to clover. The results were as follows:

FIRST YEAR.

	Straw. lbs.	Grain. Bush.	lbs.
Banner oats, where clover seed withthe grain crop had been turned under..	5110	55	
Banner oats, where no clover had been seeded with the grain crop	2260	44	4
Gain from Clover	2850	10	30

SECOND YEAR.

Banner oats, where clover seed withthe grain crop had been turned under..	3270	44	38
Banner oats, where no clover had been seeded with the grain crop	2320	33	36
Gain from Clover	950	11	2

Tototal gain 3800 lbs. straw, 21 bushel 31 lbs. grain, for the two years from seeding clover with the grain crop, the growth of which was plowed under in the fall of the same year. This increase of crop is equal to approximately $25.00 at present prices and the gain must have been due principally to the one crop of clover.

Similar tests with corn and potatoes show the following gains.

Similar tests with corn and potatoes show the following gains.

	Tons.	lbs.
Corn, where clover sown with grain was plowed under	19	1560
Corn where no clover was plowed under	16	1160
Gain from clover	3	400
	Per Bus.	acre lbs.
Potatoes where clover sown with grain was plowed under	320	
Potatoes without clover	280	40
Gain from clover	39	20

Repeated tests show that the clover does not lessen the yield of grain when seeded with it, and similarly a cover crop is not a detriment in orchard practice but rather a gain.

It has been said by some one that a good crop of clover turned under is worth as much in fertilizing value as ten tons of manure per acre. It would seem from what we can find out that this is pretty largely true. At least investigation shows that a vigorous crop of clover contains in stems, leaves and roots:

100 lbs. nitrogen.
30 lbs. phosphoric acid.
85 lbs. potash.

and well made barnyard manure from well fed animals contains in 1 ton:

10 lbs. Nitrogen; in 10 tons....100lbs
5 lbs. Phosphoric acid, 10 tons. 50lbs
9 lbs. Potash; in 10 tons..... 90lbs

At the present price of commercial fertilizer; that is, Nitrate of Soda, $70 per ton; Slag, $16 per ton, and muriate of potash, we will say $150.00 per ton, although even at that price I doubt that it is available, but probably if you are buying mixed fertilizer you will pay at that rate per lb. at least. Nitrate of soda contains about 15% nitrogen, one ton would contain 300lbs. which at $70 would be 23 1-3 cents per lb. Phosphorus approximately 6 cents per lb. and potash at above assumed price would be 15 cents per lb., as muriate of potash contains 50% potash, or 1000 lbs. in one ton.

Figured then on this basis a ton of well made stable manure from well fed stock would be worth as follows:

10 lbs. Nitrogen at 23½c	$2.35
5 lbs. Phosphoric Acid at 6c	.30
9 lbs. Potash at 15c per lb.	1.35
Value per ton	$4.00

Considering therefore the scarcity of potash we cannot afford to let this important fertilizing element be lost through our method of handling.

This is calculated according to the prices you have to pay for the various fertilizing constituents in commercial fertilizers at the present time and does not include the value of manures for their humus contents. In both cover crops and manure we are liable too often to forget about the important part humus plays in producing conditions suitable for crops other than the supplying of necessary plant food.

When speaking of well fed and well kept stable manure it is well for us to keep in mind that manure from animals poorly fed is not nearly as valuable as that from well fed animals, and that a manure from which the liquids have been lost is not nearly as valuable as one where it has been retained. Just in this connection it is interesting to note that almost half of the total value of the excrement lies in the urine. Particularly is nearly four fifths of the potash found in the liquids voided by animals. The following table gives the per cent of the different fertilizing ingredients found in the excrement of the cow and horse.

	Nitrogen. %	Phosphoric Acid. %	Potash %
Horse urine	1.52	tr.	.92
Horse, solid excrement	.55	0.35	.10
Cow urine	1.05	tr.	.36
Cow, solid excrement	.43	0.12	.04

In the face of this we see absolute carelessness on the part of many farmers in not using absorbents in the stable to retain all the liquids voided by animals and also often a great waste from careless handling of manures which should be worth from $3.00 to $4.00 per ton.

It is estimated that the number of pounds voided by full grown animals in 24 hours is as follows:

	Solids lbs.	Urine lbs.	Total Excrement
Horses	33	8	41
Cows	49	19	68
Sheep	2	2	4
Hogs	4	3	7
100 hens	8.5		8.5

The whole point of this address so far is to show the comparative value of the leguminous crops as compared with stable manure, and if possible encourage a more extensive growth of the nitrogen gathering crops in our orchards.

R. J. MESSENGER
President of The Nova Scotia Farmers' Association.

It would seem to me in the face of conditions that at present exist we should adopt some system to make a greater use of the clover and vetch than we have in the past.

I am often asked whether I would advise lime for an orchard. My reply is yes for the purpose of starting a clover crop if for nothing else. It is doubtful of what value lime is to us to increase our apple crops, but certainly many orchards will not produce clover without lime. The quantity per acre required will vary somewhat, and in many cases all the lime requirements may be made up by a judicious use of Slag. I am convinced by our experiments at Kentville that lime in some form is essential in order to get a growth of clover on many of our soils. The reason why vetch has given better results than clover is that vetch will thrive on soils which are quite acid although liming is usually helpful to it. It has therefore a far wider range of adaptability than clover which tends to disappear altogether when soils become exceedingly acid.

The following experiments conducted at Kentville are of particular interest at this time as having a direct bearing upon the growth of cover crops. The Nitrate of Soda and Slag were applied in 1913 and 1914 but not in 1915. The experiment covers a three year rotation, potatoes, oats, clover.

	Potatoes 1913 Bushels	Grain 1914 Bush.	Lbs.	Clover 1915 Lbs.
150 lbs. Nitrate of Soda, 50 lbs. Slag	196.5	54	4	9521
50 lbs. Slag	160.0	33	18	6987
Gain	36.5	20	20	2534
150 lbs. Nitrate of Soda, 500 lbs. Slag	196.5	54	4	9521
No Fertilizer	161.5	30		3000
Gain	35	24	4	6521
500 lbs. Slag	160.0	33	18	6987
No Fertilizer	161.5	30	00	3000
Gain	1.5	3	18	3987

The plots on which no fertilizer was used had no clover at all whereas the slag plots were practically entirely clover.

In another test where the nitrogen content of the fertilizer was made up entirely of dog-fish scrap fertilizer to represent a 4 per cent mixture and acid phosphate and muriate added to make 4 per cent. phosphorus and 10 per cent potash, and lime added to one plot, the results were as follows:

	1914. Straw Lbs.	Grain Bush.	Lbs.	1915. Clover Lbs.
215 lbs Fish scrap				
233½ lbs. Acid phosphate				
100 lbs. Muriate of Potash	2516.2	57	8.2	4567.5
No fertilizer	1787.3	45	12.5	2405
215 lbs Fish scrap				
233½ lbs. Acid phosphate				
100 lbs. Muriate of Potash				
3000 Ground Limestone	2625.	66	6	6760

In this case also the difference in yield was made up principally from the extra growth of clover which was even and strong on the limed plots.

It is interesting to note that lime of itself will not always give increased crops. On poor soils there is not the gain one might expect for lime will not furnish the necessary nitrogen, potash and phosphoric acid.

Just in this connection we hear considerable about the ability of lime to liberate potash from the soil. It is no doubt true that where soils have been fertilized generously with potash in recent years the use of lime will add noticably, for a time, to the quantities of potash which plants can take from the soil. This is due to the fact that lime enters into certain compounds replacing potash, which then passes into solution in the soil water or is held in the soil in such a physical state as to be more readily available than before. It is obvious that an end to such a possibility will soon be reached, for there will not be sufficient potash remaining in these readily decomposable compounds to be liberated to any practical extent. The most of the potash in soils is present in such combinations that lime will have on practical effect upon it. It seems to me little can be hoped for in a practical way by attempting to set free potash for crops by liming.

The fact that large quantities of potash have in recent years been used in the Valley will materially help, but the source of our potash supply in the future should be through the clover plant with its deep feeding root system which will do more to liberate potash than will the lime.

Many of our orchard lands are so deficient in humus and plant food that they will not grow cover crops even if lime is used. If such is the case a system should be adopted to give to the orchard sufficient stable manure to get a good clover crop started after which there will be little difficulty in securing a good catch. From 5 tons of good stable manure to 10 tons of poorer grades per acre should be sufficient if properly applied to give an excellent catch. If necessary to this soil should be added about from 2 to 4 tons of ground limestone per acre. In some cases Slag is all that will be required and this can be applied at the rate of 1000 lbs. every three years. I am of the opinion that it is best to give a good application at once rather than spreading it in small quantities over several years. In other cases it may be that lime only is required. This can be determined by the vigor of growth in the orchard and quality of the fruit previously produced.

To bring my remarks to a conclusion therefore it is clear that we should depend more than we have been doing upon clover, that if necessary stable manure should be used to give the necessary plant food and soil conditions to secure a good stand, and liming usually will be necessary. Basic Slag may in some cases be used to furnish the lime requirements in addition to the phosphorus. In case acid phosphate is used lime should always be used. The potash can in a measure be secured by taking more care of our stable manures and using more absorbents such as straw, sawdust and dried peat to hold all the liquids voided by our farm stock.

Results Obtained at the Dominion Entomological Laboratory During 1915

By G. E. Sanders, Field Officer in Charge, Annapolis Royal, N. S.

Before taking up the subject which I am to speak on, I wish to thank you fruit growers for the support which you have given so generously to our work in the past. The new building which you asked for at your last annual meeting has materialized in an up-to-date four room laboratory on land which the school board of Annapolis Royal very kindly placed at our disposal. The assistance which has been rendered by a number of your members individually, including Mr. F. H. Johnson, S. B. Chute, A. Fitz Randolph and many others has enabled us to do more valuable work this last season than in any previous. I am only repeating what Dr. Hewitt and many others tell me, when I say that the Dominion Entomological Laboratory has been a success, in that it has helped in causing more and better fruit to be grown in Nova Scotia, and the main reason for this success has been the attitude of your fruit growers. A number of you have put yourselves out to help us in every way possible to secure new information in regard to spraying, and you have helped in acting on and spreading conclusions which we were able to draw from such information. Today the average Nova Scotia grower is living up more nearly to the best information he has on spraying than any other grower in America, and I think you will all agree that there is still plenty of room for improvement, so I am going to ask you to keep on helping in securing information and in persuading your neighbors to spray, until we have every orchard in the valley properly sprayed; then we will be able to deliver apples to the English trade that we may be proud of and that we may advertise even more loudly than we do our apples of the present time.

Spraying Conditions for 1915.

Probably we had more damp weather during the spraying season of 1915 than we ever had before. According to my diary rain fell in greater or less quantities on 21 days during May, and on 18 days during June. This continuous dampness caused an immense amount of burning wherever lime sulphur was used, and although most growers are blaming the particular brand of lime sulphur that they used themselves for the burning, we find that all brands burned to about the same extent, and it was the season and too strong a solution in many cases that were responsible for the burning rather than any particular brand. In addition to burning the leaves we have good evidence during the past season that lime sulphur used too strong will cause a reduction in set of fruit and for the coming season we recommend its use at not stronger than 1.007 specific gravity after the blossoms fall. As far as we can now determine, the stem of the young apple is most susceptible to injury about ten days after the blossoms fall, and for that spray we are recommending lime sulphur a little weaker than 1.007 specific gravity. We have not yet finished our work along this line, but following our principle of giving you our findings just as soon as we are certain of our results. We must warn you against using lime sulphur at greater strength than recommended. For further information, see the spray calendar gotten up by Prof. Brittain and myself.

New Nozzles

From the growers' standpoint, probably the most valuable piece of work done during the past years has been the testing of the new nozzles put out by the Friend Manfg. Co.

These nozzles, the Drive and Calyx, are suitable only for power outfits at a pressure of 200 pounds, and are the finest for their respective purposes that I have ever seen. As only one nozzle is needed on each rod, the cost of them is about two fifths of the two nozzles and Y now used on each rod.

First, to take up the drive nozzle: It is primarily an insect nozzle, throwing a coarse spray from 2 to 3 feet wide at high velocity. It drives into chinks and crevices which the ordinary mist nozzle does not wet at all, and so gives us very much better control of all the insects that effect the apple before the blossoms. In the case of the budmoth which are our most injurious insects, we had during the past season seven comparisons of the drive nozzle and mist nozzle in budmoth control, and in every case the drive gave the smallest number of apples injured by budmoth when picked. We found respectively 40.9, 34.3, 87.8, 30.8, 3.1, 60.5 and 33.6 per cent more apples injured by budmoth in the plots where the mist was used than in the plots adjoining where the drive was used.

In the case of the fruit worms, we found practically the same increase in control. We found respectively 11?, 22.2, 46.4, 35.9, 9.8, 2.5 per cent more apples injured by fruit worms where the mist nozzle was used than in the adjoining plot where the drive was used. In one pair of plots we got exactly the same number of apples injured in each plot. As was suspected, the increased control of fruit worm came mostly from the mechanical jarring of the leaves, the larvae being very active and in the habit of dropping to the ground when disturbed This was proved out by spraying two plots with water only. When the water was applied with a mist nozzle we got 8 per cent of the apples injured by fruit worms, and where it

was applied with the drive nozzle we got 4.5 per cent only injured, proving that the mechanical action of the drive nozzle is an important factor in the control of fruit worms.

One drive nozzle will at the same pressure throw almost as much spray as a pair of mistry or whirlpool nozzles; the advantages of it lie in the high velocity of the spray as it leaves the nozzle. It throws a good spray from 4 to 6 feet from the end of the rod and is useful on high trees; the spray going at much higher velocity than from the ordinary nozzle drives into clusters of leaves, curled up leaves and places that the ordinary nozzle cannot touch, and so gives better control of budmoth, fruit worm and codling moth as well as the aphids and plant bugs of which Prof. Brittain has spoken. The disadvantages of the drive nozzle lies in the narrow spray which it applies. In the hands of a careless operator narrow portions of the tree will often not be covered properly, and inferior spot control result; but with careful men we got on several occasions better spot control this year from the drive than from the mistry nozzles against which it was tested. We recommend the drive nozzle above all others for the two sprays before the blossoms.

Calyx Nozzle

The Calyx nozzle resembles the mistry or whirlpool in shape, size and type of spray aplied. One Calyx nozzle will throw fifty per cent more spray than a pair of mistry or whirlpool nozzles. It is primarily a black spot nozzle, throws a very fine spray and a lot of it. With a smart man on the rod the calyx nozzle will cover a tree more quickly and better than any other nozzle I have seen, but it is no nozzle for a lazy man. It throws out too much spray if he stands to talk between the trees. Properly handled, the Calyx nozzle should prove a time and money saver in any orchard. Like the drive nozzle the Calyx requires 200 lbs. pressure to work properly. The two cleanest lots of Gravensteins that I saw in 1915 were sprayed with Calyx nozzles, namely Mr. R. H. Fowler's which packed out 83 per cent No. 1, and Mr. Alfred Messenger's which packed out 77 per cent No. 1, tree run. We recommend the Calyx nozzle for all sprays after the blosoms.

Budmoths

During the past season we found in addition to the three species of budmoth already recorded from the Annapolis Valley a fourth species, The Lesser Budmoth, (Recurvaria Nanella Hubn), an insect of European origin, where it is a serious pest on apple, pear, plum and peach. It was probably brought to American some years ago, as it has already spread over the eastern half of the United States as far west as Michigan and was this year found for the first time in Canada, being recorded both from Nova Scotia and Ontario. The life history and treatment of this new budmoth is on the whole similar to the three that we have already investigated in Nova Scotia. One point in which the treatment for it differs from our other three budmoths is in the effect which the odour of sulphur sprays have on it; almost complete control having resulted from a late dormant or semi-dormant lime sulphur or soluble sulphur spray. The spray does not seem to kill any larvae in their hibernating quarters, but when they emerge in the spring the odor of lime or soluble sulphur appears to nauseate them so that they drop to the ground rather than bore into the opening buds on such ill-smelling trees (Bull. 113, U. S. Dept. Ag.) Just what this new budmoth will do in the future we cannot of course tell. It is a native of Europe, imported into this country without its native parasites, and even in Europe it is a serious pest. So we may have in it a very much more serious pest in the future than in the past.

Now in regard to the control of the budmoths that we have been working on in the past; we have found this year means of controlling them better than ever before. We have always been in doubt as to whether two sprays before the blossoms were better in budmoth control than one spray about midway between the two. This year we tested this point out, and found that where we used only one spray we killed 50 per cent. of the budmoths, but where we used two sprays we killed 75 per cent of them, or the extra spray increased our control of budmoth by 50 per cent. I have already spoken of the superiority of the drive nozzle in budmoth control, so our recommendation for budmoth now is, spray with the drive nozzle at 200 lbs. perssure, first when the leaf is the size of a ten cent piece, and again imemdiately before the blossoms, using 5 to 7 lbs. of paste lead arsenate or 1½ to 2 lbs. of dry arsenate of lime per 100 gallons with of course the sprays after the blossoms which control a great number of them.

Brown Tail Moth

We have on the whole had two very successful years in brown tail moth control. Last year we found 18,154 nests in the province against 24,156 nests the previous year, following the big flight from the New England States, or a decrease of 6,002 nests. This year up to date we have found on the whole a big decrease, with increases in a few isolated localities. Only ten inspectors are employed, five by the Dominion and five by the province, and they have to cover all of Shelburne, Yarmouth, Digby, Annapolis, Kings, Hants and part of Cumberland, Queens, Lunenburg and Halifax counties—or approximately two million apple trees scattered over that territory, so they have little time for other than orchard property, excepting when thorn scrub is known to occur. That they have prevented the brown tails from ever doing a dollars worth of damage up to date in Nova Scotia is, I think, something that we can point to with pride, for Nova Scotia is the only locality in which the climate is very favorable to brown tail moth development where it has been controlled and prevented from doing damage. We found this year a very interesting outbreak which goes to show in a very striking manner what the brown tails would do in Nova Scotia if left uncared for. Just south of the church in Torbrook and across the river there is a thorn scrub in a pasture which none of our inspectors knew of and so had never before been visited; this year a few nests were found in apple orchards near by and an irregular line of nests traced from bush to bush until it led to the heaviest infestation we have yet found in any part of the province; over 1500 nests have already been taken from this pasture and there are probably 500 more yet to come. The whole scrub does not cover over 30 acres, the most heavily infested portion about ten acres; there were enough brown tails present to eat every green leaf off the central ten acres. The infestation had been running there for four or five years. I cannot blame the inspector who worked that territory last year for not uncovering the infestation, for in order to get his territory done he had to confine himself almost entirely to orchard inspection. If we were to inspect pastures and woodlots we should need three times the number of men. The Torbrook outbreak shows in a very striking manner the state in which the unsprayed and half sprayed orchards of the Annapolis Valley would be in if the brown tail were allowed to run unchecked. We have found that a campaign for more spraying has given us good returns in the control of brown tail moth, so we have our inspectors call on each man whose property is infested with brown tails and inform him of the fact, advising him to look for more nests after they have finished his orchard, and also to persuade his to spray if possible.

We have as inspectors the best men obtainable, mostly graduates of the Nova Scotia Agricultural College. They have all the data obtainable on spraying at their finger tips. If when you see them going through your orchard, you want to know if Aphids, Plant Bugs, San Jose Scale, Canker Worm, Tussock Moth, or any other pest requiring special attention are present, stop them and have them make an inspection, and get what information you want on spraying from them. They are sent out to help you in your orchard problems as well as to collect brown tail moth nests, so make all the use you can of them. On the other hand, while we have the best inspectors obtainable, they have a very large territory to cover and cannot get every last nest for a great number of reasons. You may find a nest left after they have gone through your orchard. We should like every owner to inspect his own orchard; if he finds more than one or two nests after the inspectors, we would consider it a favor if he would write in to the laboratory stating the fact. We want inspectors who will do their work right. If they do not do it right in an orchard, the owner should let us know. If your orchard is infested with brown tail moths, and if it is, the inspectors will call on you informing you of the fact, try to spray the orchard next spring. If it is your neighbor's orchard, try to persuade him to spray; do not allow a public nuisance, such as an orchard infested with brown tails, to be maintained in your neighborhood.

Canker Worm

Last year in this meeting I warned you of a very wide spread outbreak of Canker Worm, which would damage a great many orchards in the spring of 1916,—that warning was based on reports of our brown tail moth inspectors. This year, reports from the same men say that the infestation is increasing and that a great amount of damage will be done next spring. A few owners have already applied tanglefoot bands. Where these bands were not applied, very thorough spraying in 1916 is all that can now be depended upon to control canker worm. If you say any number of light moths about the trunks of your trees during November you can depend upon it that they will eat more or less of the leaves from your trees next spring, and will so cause you some loss.

In regard to spraying for canker worm, we of course all know what a hard insect it is to poison. When more than half grown it apparently thrives on arsenic, so in order to control it we must have the leaves thoroughly coated with poison when it emerges from the egg and begins feeding, for it is then comparatively easy to kill. Most of the canker worms emerge about five days before the blossoms show pink, so if your orchard is infested put on the pink bud or second spray a couple of days earlier than usual, or else retard your semi-dormant or first spray until the leaf is as large as a 25 cent piece, using in both sprays a larger quantity of poison than usual.

The present outbreak is wide, covering the whole Valley and in a general way only the orchards that have been heavily sprayed for the past two years are in any way free from them.

Tussock Moth

We are now on the eve of another outbreak of Tussock moths. Inspection has shown this outbreak to be widespread, probably heavier in the west end of the valley than in the east. The Tussock moth was particularly bad in the east end of the valley in 1906; the next outbreak in 1912 did not affect the valley so much. This present outbreak will damage a few orchards in 1916, but will not reach its height until 1917. In one orchard this year I found a large amount of fruit disfigured by the feeding of the larvae. The injury might, at first glance, be mistaken for that of the fruit worm, but the feeding is done later and does not heal out so perfectly. The apple is seldom deformed, the edge of the eaten areas are irregular, often extending irregularly over half of the apple.

The eggs of the Tussock moth were deposited by the female about August 30, about 150 eggs in a cluster, on the old pupa case and covered with a frosting or froth to protect them. They may be found on any part of the tree, usually on the fruit spurs of the apple. The young larvae will emerge during the last week of June and feed for two or three weeks on apple leaves, later feeding on the fruit to a certain extent. In order to control Tussock moth we must therefore put poison into our last summer spray, or that going on during the last week of June. If the eggs of Tussock moth are in any way numerous in on orchard, it would pay to put in a larger quantity of poison than usual in the last spray.

Results of Spraying in Orchards.

Last year I gave you a sheet showing the percetnage of No. 1 and 2 Gravensteins packed out by the Round Hill Fruit Company, with the number of times each orchard was sprayed, an dother details, and I am giving here the same table for the same company for the year 1915. The percentage of No. 1 and 2 are not as high as last year, but as a demonstration in favor of spraying the results are as good.

THE MARITIME FARMER.

And Co-operative Dairyman
Registered Trade Mark

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said :—"I saw" your adv. in the MARITIME FARMER.

RATES FOR CASUAL ADVERTISEMENTS.

1 inch—First insertion 75 cents 2 inches—First insertion $1.50; inches—First insertion $2.25.

Contract rates on application.

Address letters and make all checks, money orders, postal notes, etc., payable to

THE MARITIME FARMER, or
R. D. Robinson Publishing Co., Limited
Sussex, N. B.

Toronto Representative—J. Lester Davis, Miln Building 8 Johnson Street.

Montreal Representative—Dakers Cameron, St. Nicholas Building.

NOTICE TO ADVERTISERS.—Changes of ads. should reach this office one week before date of issue, in order to insure insertion.

RECEIPTS FOR FARMER SUBSCRIPTIONS

The Maritime Farmer, instead of giving you one receipt in the year for a paid subscription, sends you 24, or one every two weeks. You will find it on the GREEN COLORED LABEL on which your address appears. The date printed thereon is that on which your subscription terminates. If on payment of your subscription the date is not changed within two weeks, please notify us. No other receipt will be sent.

FEBRUARY 22, 1916.

DATES OF ISSUE.

March 7-21
April 4-18
May 2-16
June 6-20

WASTING FERTILIZER

Our farmers are confronted this year with abnormally high fertilizer prices and consequently they are turning their attention to the manure produced on their farms. At least one third the value of our barnyard manures is lost by neglect on the part of the stock owners who must make up for this loss by expending enormous amounts of their surplus cash in the purchase of commercial fertilizer. "'Tis wilful waste makes woeful want." Many of our farmers are beginning to wish that they had been more careful to conserve all available farm yard manures.

A writer in Hoard's Dairyman says: "The manure pile is never still. From the minute the hired man finishes the morning task of cleaning the stables, the elements in the manure begin action. Much of the nitrogen turns to ammonia and evaporates into thin air. Some is converted into nitrates and, with the first rain, is washed away. Still more becomes nitrogen gas and disappears." "There are two ways to prevent this loss—have a cement cistern for the manure, or haul it to the fields every day or so. Cement cisterns can be built with little expense, and they soon pay for themselves. They are especially valuable in saving the liquid excrement, which contains the most nitrogen and potash. The best results are obtained if the liquid manure is kept separate from the solid manure. When applied to the fields, however, solid manure should be added to it, otherwise the ground becomes hard for want of humus.

"Cisterns are coming into more use every year because on most farms it is not practicable to haul out the manure every day. Even where the cisterns are not yet installed, better care is being taken of the manure. And the old way of turning the pile over with a fork two or three times a year so it will rot well is being abandoned. True the rotting process destroyed harmful weed seeds, sometimes, but there was also a heavy loss of nitrogen and ammonia, as well as wasted plant food, because the rains washed away much of the decayed straw, etc. Now rotted manure is used principally by gardeners and it is the best for that purpose. The reason for that is that gardeners want the most plant food in the least possible bulk. For the farm, however, where not only plant food is wanted but also considerable humus, or decayed organic matter, the fresh manure is the best.

"Comercial fertilizers are good, and they serve their purpose. But it's a wrong policy to use them in place of manure. Get the most out of that manure pile first."

Some of our best authorities on agriculture, men who made a study of the subject, from all angles, claim that live stock is the salvation of Maritime agriculture. Why? Because there is always something to return to the soil in return for the drafts growing crops have made on the plant foods stored in the soil. Help repay these drafts by conserving all the manure, liquid and solid, made on your farm.

MILK VEINS

Hoard's Dairyman says:

In estimating the capacity of a dairy cow, milk veins have always been given considerable attention. It is through them that the blood from the udder is returning to the heart. If the veins are large and tortuous it is believed that a large amount of blood is passing through them and this indicates that the udder is well supplied with blood. It is from the blood that milk is elaborated, and it follows that when the udder is well supplied with material from which milk is made that the cow will be a good producer. It may be said that most of our good cows have well developed milk veins, and they are so common with cows of large production that we admire a well veined animal.

"A few years ago Dr. King of Maine called attention to the fact that the size of the milk veins, as determined from external appearance did not indicate their blood carrying capacity. The walls of the veins, he held, may be thick and the openings through which the blood flows small. Further, the flow of blood is more rapid in some animals than in others.

"There has been little scientific study of the milk veins in order to determine how much their size indicates capacity. Professor R. R. Graves of Oregon Experiment Station has undertaken to find out just what dependence can be put upon the milk veins in judging a dairy cow. He tied off the milk veins of a pure-bred Ayrshire cow so that no blood could pass through those we ordinarily see extending forward from the udder. No ill-effects came to the cow and there was no decrease in the flow of milk of this animal. His work has not been carried far enough to warrant any conclusions, but it does indicate that perhaps we have laid too much stress upon the size of milk veins as an indication of dairy capacity.

'This work of Professor Graves suggests to us the splendid opportunity for a physiologist to study the factors that control milk production and to give us some definite infromation, if possible, upon estimating the cow's dairy capacity by external indications.

THE BEST IS THE CHEAPEST

While in conversation with a breeder of pure bred poultry a day or two ago, he remraked that last season he advertised eggs for sale from two pens of the same breed. Eggs from Pen No. 1 were quoted at $3.00 per fifteen and from Pen No. 2 at $2.00 per fifteen. During the season he sold twenty settings and invariably the request was for eggs from Pen No. 1. This is ample proof that our poultrymen are beginning to realize that the best is none too good.

A breeder of pure bred cattle told us not long ago that he had recently sold six young bulls. These bulls were thrifty youngsters, every one of them. All by the same sire, but out of different dams. The prices quoted were guaged on the producing qualities of the dams. While the cheapest bull looked just as well as the highest priced bull, the former was the last one sold, as invariably, regardless of price, the buyers purchased the bull whose dam had the best producing record.

This is another sure sign the trend is in the right direction. It shows that our farmers are more than ever getting away from the idea of buying on pedigree only. They want pedigree and production combined and do not purpose to allow the question of a few extra dollars to interfere.

When it comes to the paying of prices for first class blooded live stock to improve our herds, or the best seed grain we can get to sow our fields with, the most of us are governed by traditions and mere notions as to values and not sound reasons. At an Iowa convention the question was asked: "What can we afford to pay for good seed corn?" One man present said: "Fifteen dollars a bushel if you can't get it for any less." That would be about 50 cents a quart, or $3.00 an acre. Well, does anybody think he would not be pretty certain to lose more than three dollars an acre if he planted poor seed? Poor seed is fearfully expensive at any price and good, viable seed is always the cheapest at any price if you are going to plant corn at all.

What holds good in regard to the value of good seed corn is also appreciable to all other classes of seed grain, clover, grasses and vegetable seeds.

The introduction of pure-bred bulls from high record stock into any community is sure to increase the average production very markedly in a very short time. This can be brought about by the Agricultural Societies and Live Stock Associations. A community should strive to breed the same kind of cattle so that good bulls can be exchanged and not allowed to be butchered or leave the community.

* * *

Have your palns made as to just where you are going to plant your different varieties of garden seeds.

* * *

Have you sent for the catalogues of all the seed houses advertised in the columns of The Maritime Farmer? Canada's most reliable seed houses advertise in our columns. It will pay you to send for their catalogues and study them thoroughly, then make up your orders and procure your seed supply before the rush season is on.

* * *

Have you talked with your neighbors about subscribing for The Maritime Farmer? Why not do it now? Make up as large a club of subscribers as you can and send them in. You will thus be doing your neighbors a good turn and we will reward you for your trouble.

A New Kind of School Needed

(Continued from Last Issue.)

How are we to get an education suited to all these functions and activities of the farmer? That he should have such an education will surely be admitted by everyone. Will a bare grounding in the three R's not suffice? Surely not! Can't the "little red school house" of revered memory be modernized to yield the desired return? It is not possible. With all due respect to the zeal and skill of many of the little girls or young women who teach in the country schools of Canada, I am forced to the conviction that they can never under the best circumstances work out a fair solution of the problem of education for country life.

The fact is that the one teacher country school is out of date just as the cradle is out of date for harvesting. It may be that for out-of-the-way corners such a school may have to be kept just as the old-fashioned cradle is still required sometimes for securing fence corner harvests. But for most parts of eastern Canada at least, the one-teacher school should be 'scrapped.' That is what is done with defunct machinery in any common-sense business now-a-days. It 'scraps' the out-worn.

No, the kind of education needed to make rural Canada great and contented and prosperous, will never be forthcoming from one-teacher country schools. We must consolidate. Country people must co-operate in education. The unit of administration of country schools must be enlarged. Sectionalism must be broken down. We must grow bigger people and people cannot be bigger than their schools. The average country school cannot produce anything bigger than itself and it is very small. We need consolidated schools that can take pupils into high school work. In other words country people's high schools.

Colsolidation and Country People's High Schools

By "country people's high school" is not meant a town high school such as we have them now, translated into the country, carrying on its university preparatory and professionalizing work. There will always be need for these, I presume, but what is needed is a school of secondary grade that will bring high schooling within the reach of every boy and girl in the remotest parts of the country; uniting its organization and instruction to the actual needs of the country, not to the supposed needs of a few who may or may not go on to college and life-work in the town; opening its doors in the winter months to all and sundry; keeping boys and girls at school until they are 17 or 18 years old; bringing older people in for short courses; acting as a community centre for all country organizations, farmer's institutes, women's institutes, co-operative associations, debating societies, creating a new spirit and developing a country people of enlarged visions of the value of an education that serves their needs.

It will be in such schools and in such schools only that we will be able to secure the six-fold educational need of the Canadian farmer, as trained Laborer, Agriculturist, Mechanic, Scientist, Business Man and Citizen.

Possibilities of the Sussex Agricultural School

And what an opportunity you have right here in Sussex in this fine new Agricultural School in which we are meeting! It shouldn't be difficult to adjust the uses of this school in the directions indicated! This school should have a great influence in this province for a new kind of educational leadership. Far-reaching betterments may be looked for from it!

Five Agencies for Improvement

And how are these things to be secured? Ah! there's the rub! It's easy to demonstrate the need. Everybody sees it. Everybody acknowledges it. But what's to be done about it?

According to my view of the matter there are five chief lines of attack, or five agencies to be set into action. Let us set these before you briefly. Each might be the subject for a separate address but a brief outline will suffice now.

The Teacher Missionary

First—We must work with the tools that are at our hand. We must use the schools and the teachers that we have now for securing the "new idea" and the "new desire," without which the end cannot be attained. "Without a vision, the people perish." In this case they do not perish, but they cease to grow, which is a phase of perishing.

You, as teachers of Nature Study and Agriculture, must go out amongst the country people of the Province of New Brunswick with a missionary's message, you must carry a new gospel of education to your people. By the better teaching and the better matter of instruction that you give to the children you will reveal a new purpose in education. You will lead the people to see a new school possible in their old one. You will make them desirous of more of the good kind of thing their children are receiving. For that you will make them willing to tax themselves more or to urge their representatives in the legislature to vote more money. Out of the old will arise the new. The one teacher school of the pioneer phase of agriculture will be replaced by the modern school founded in a spirit of co-operation.

The Universities' Responsibilities to Country Life

Second.—We need a new kind of direction from our universities. A university as I understand the term is an agency of instruction in universal knowledge. In reality they are not so, at least in Canada so far as I know them. Most of them shut their doors against a large part of the clientele they are supposed to serve. At least the doors of entrances are so narrow and so difficult to approach that few reach them. The entrant must come to them specially moulded to fit the door. Through special subjects of study, which have been used for a few hundred years and which therefore must be still necessary, the candidates must be prepared, or they cannot be fit for further instruction in the higher seat of learning.

And what has this to do with better education for country life? The university has nothing to do with country life. None of its graduates live in the country! It recognizes no direct service to the country! Farmers surely can't be affected by what the university requires of its candidates! It has nothing to do with them!

The university affects the situation in this way. Hitherto and largely now, our system of primary and secondary education is organized on the supposition that everybody may go to the university. The teachers have been nurtured in this working principle. They perpetuate the supposition and put it into practice. They teach to pass pupils through examinations into the high schools and the high schools look upon every pupil who enters its doors as a possible candidate for a higher examination which is shaped in most provinces, though not so much in New Brunswick, I am told, by the narrow university requirements.

Don't you see then that the University hinders the admission of new subjects just as rich in culture-value, too, as Latin or Greek or French or German or some of the mathematics required—back in the country school? It does it not only in a physical sense, but in a hypnotic manner also. Because the university requires such and such, the ordinary school man and the ordinary ratepayer assumes that the requirment must be fair and right. And because there is no popular demand for reform, the university remains fixed in its old-fashioned system, and teachers go on in their old-fashioned ways too.

There are good signs, however, of a change. Many of the American universities have broadened out greatly. This is true particularly in the central west. Chicago University for example accepts into its classes practically any pupil who has completed four years of satisfactory work in a good high school. Out of 15 credits required (a credit is a subject taken for an hour a day for one year) the only obligatory subject is English. For most of the credits, the widest cohice is allowed including such things as Domestic Science, Music, Agriculture, Spanish, etc. In several other American universities the obligatory subjects are Mathematics and English. I believe that in one at least of our own Western universities, this modern principle is to be recognized in part. So we in the East may hope.

In visiting a high school—a real country people's high school such as I described previously, in a little country village in the State of Minesota two years ago, I was surprised to find that some of the pupils who looked forward to entrance into their great state university were not required to take Latin but had such a subject as agriculture accepted as a credit instead. I was surprised because I had never heard of anything like that in Canada. So I asked the principal how it was. He wasnt' ignorant of our needs for he was Canadian born. His answer revealed a not uncommon wrong-end foremost university attitude. He said: "Oh! we own the university in this state; it doesnt' own us!"

When will our universities get the notion that boys and girls are not born and reared and sent to school in order that they may "go to the university"? And when will they so adjust their entrance requirements that the urgent needs of 95% of those who attend common schools may be readily arranged for? It's a far cry from the country school to the university; it is farther from the educational needs of country life to the educational processes of our universities.

Modern Methods from Departments of Education

Third.—We need constructive legislation and modern methods of propoganda and leadership from our provincial Departments of Education. The day is past when a modern government can fulfil all its duties to those governed by simply passing laws and formulating regulations. It has to follow the lead of good business corporations and take its patrons into its confidence. It must find means of letting everyone know what it is thinking about and what it wants them to do. It has to take on a personality and cease being a mere bureau.

There is nothing in the field of education more needed than education about education. The hopes for satisfactory progress rests on the educated intelligence of the mass of school supporters. There is a great field in this for Departments of Education.

We have some fine examples of this in several provinces. Mr. Steeves here has his personal conferences and his circular of instructions; Manitoba has its travelling advocates of consolidation; Saskatchewan has its splendid "Public Service" review in which the activities of all branches of the government are set forth and put into the hands of everyone who is interested in the government of his own province.

This attitude towards those who are served and these, or better, means of enlightenment are due from our Departments of Education in order to make the best progress.

Women's Activities In Education Needed

Fourth. One of the best assurances of better country schools for the days to come lies in the splendid development of women's activities in the Women's Institutes of Canada. In many places they have already given their practical attention to the concerns of the schools and the schools have greatly benefitted. When the war is over it will be found that their power has increased wonderfully. In the patroitic and Red Cross work, they are strengthening themselves in co-operative and unselfish services. With the needs of the schools and of rural education in general made plain to them, what may not be hoped for?

Our country women should be encouraged to take a place with men in managing our schools. In many respects they are better equipped for this than men. They are the natural home-helpers to children in school work. They are instructively more concerned in the affairs of the school. And they are better educated than men! All over Eastern Canada at least, it will be found that our girls are getting more schooling than our boys. The senior classes in the country schools and the high school classes in country towns and villages show the girls greatly outnumbering the boys. In the school in which I teach the proportion is about five girls to two boys in the first year classes. If trained intelligence is needed for qualification in trusteeship, surely our omen should have a share in managing our schools! If our men have failed to keep pace with the times, perhaps the women could speed them up a bit!

A Federal Bureau of Education Needed

Fifth—We need the force of the federal government in the undertaking. You say the Dominion Government has no given place or rights in the field of education. Well, if it hasn't let us give it one. Look at the Bureau of Education in the United States! It has done a magnificent work without interfering with the rights of states. We could do the same surely. There is a great cause to serve by a Dominion Bureau of Education. Think how our provincialism in education might be broken down. Imagine the good that could come from co-operation. Could anyone measure the possible growth of national spirit that might be fostered?

Undoubtedly much of the advance in education in the United States has resulted from the services of its Bureau. In Canada, there has been good too from the operation of the Agricultural Instruction Act in the field of agricultural education; all the provinces are unitedly going forward. But the field should be widened. Education is larger than Agriculture. We need the force and asistance of the Dominion Government to make the campaign for better education for country life effective. It is a national problem. There should be a national agency concerned in its solution.

Missionary teachers, redirected universities, modernized Departments of Education, women trustees, a Dominion Bureau of Education! Will these come to be? Surely. It will be a slow process but they will come. When they are commonly felt as human needs, they will come. In the meantime we must be patient—but not

DUPUY & FERGUSON,
38 Jacques Cartier Sq., Montreal

Results Obtained at the Dominion Entomological Laboratory During 1915

(Continued from Page 311)

In this lot No. 13 had trouble with his pump and had low pressure throughout; No. 14 was three days late with each spray and could not possibly get good results; No. 16 was delayed by trouble with pump; No. 19 had trouble with outfit, and was way too late with the third spray. In the list the men who sprayed five times got the highest percentage No. 1 and 2; those that sprayed four times, once before and three times after the blossoms came next, followed by those that sprayed twice before and twice after the blossoms, then come the orchards sprayed three times in a long even row, then the two sprayed twice, then one sprayed once, then one not sprayed, then one sprayed twice—the last spray way too late, and finishes with an unsprayed lot.

The lot which packed out 68 per cent No 1 and 2 cost a trifle less than 15 cents per barrel to spray the five times or at the rate of $15.00 per 100 barrels. It sold through the company at the rate of $208 per 100 barrels, the lot which came highest of the unsprayed lots coming from the field next to the best lot and grown on isolated trees, while the best lot was from a thick, closely planted orchard, and sold through the company at the rate of $143 per 100 barrels. Fifteen dollars per 100 barrels would have given that man as clean a crop as his neighbors and an additional return of $65.00 per 100 barrels, which after deducting the cost of spraying would come to a clean profit of $50.00 per 100 barrels, which the man lost through not spraying; and that unsprayed lot I may say was the very best unsprayed lot of Gravensteins I have seen this year.

In this comparison we have not considered the fact that the man who sprayed caused 80 per cent more apples to set on acocunt of insect control, and it is hard to estimate how many more on account of blackspot control. Neither have we considered that he caused the foliage to remain on his trees for at least a month longer this fall, making the fruit buds strong and full, so insuring a good, vigorous bloom for next spring. These things cannot be reckoned in accurately, but they all go as additoinal profits from spraying.

Now there is spraying and spraying—some good, some no good. No. 14 on the list packed out 26 per cent No. 1 and 2. He sprayed rather carelessly and was three days late with each spray. His appies sold at the rate of $151 per 100 barrels; the three sprays which he applied cost him at least $9.00 per 100 barrels, which deducted from $151 leaves $142, or $1 less than the best unsprayed lot. We can readily see from this sheet that good spraying gives big returns, but there is no profit in half spraying an orchard. Too many people are afraid of wasting spray; there are very few orchards in this Valley where enough is used. We can dilute it more and use more with profit. I must tell you of one of the men who experimented for us last season. We wanted him to test the drive nozzle. He said he was afraid it would waste the spray, so I agreed to give him ten pounds of arsenate of lime to make up for the waste from using the drive nozzle. On one side of the orchard where he used the drive nozzle he got 9.8 per cent spotted Gravensteins, and on the same side where he used the old mist nozzle he got 22.65 per cent spotted Gravensteins. On the other side of his orchard he got 19.7 per cent spotted with the drive nozzle, and 57.2 per cent spotted with the mist nozzle, getting in one case 12.85 per cent more clean apples, and in the other way 37.5 per cent more clean apples where he used the drive nozzle and apparently wasted a little spray. A man should cut out all miserly feelings and make himself act as much as possible like a philanthropist or a spendthrift when he is spraying his trees, if he wants good results.

Conclusion

In talking over the outlook for the apple business with different people, and reading what I could with a bearing on the future, I have found several interesting bits of information. Prof. Bunting, of McDonald College tells me that he has investigated the matter and finds that there are fewer apple trees east of the Mississippi or in Eastern America today than there were twenty years ago. Mr. F. S. Walsh, Agriculturist to the New York Central Railway, whose business it is to know such things for his employers, tells me that there are fewer apple trees in New York State today than in 1891. Several factors are the cause of this falling off in orchard in eastern America, the most important being the San Jose Scale, which has killed thousands of acres of apple and peach in Illinois, Indiana, Ohio, Virginia, New York, Connecticut and Massachusetts. In addition to killing off the uncared for orchards, the San Jose Scale is making it almost impossible to grow a young orchard in infested districts as the profits from apples in the Middle States are not large enough to justify the extra cost necessary. Then the fact that peaches are a much more profitable crop than apples in some sections has caused a portion of the reduction. Lack of profit and general neglect have also been the cause of a large amount of the decrease in Massachusetts, Maine, New Hampshire, etc.

Now, with all due credit to the system of buying co-operatively which has saved the grower anywhere from 5 to 20 per cent on his supplies, and to the co-operative marketing system which has been the cause of opening new markets, keeping down freight rates, standardizing the pack and altogether increasing the return not only to its own numbers but to the general public as well, we can also increase our profits enormously by better work in our own orchards. Last year I wrote up two orchards, one sprayed and the other unsprayed, taking the 1911 crop as a 100 per ecnt full crop

during the three years following the man who did not spray averaged 30.6 per cent of his 1911 crop of Nonpariels, while the man who sprayed averaged 111.8 per cent of his 1911 crop of the same variety. The man who did not spray for the same three years averaged 18.7 per cent of his 1911 crop of Gravensteins, while the man who sprayed averaged 116 per cent of his 1911 crop of the same variety; or the second man's crop of Nonpariels was increased by 265 per cent and his crop of Gravensteins increased by 520 per cent, over what it would have been if he had not sprayed. We have this year the best sprayed lot of Gravensteins in the Round Hill warehouse, averaging $2.08 per barrel, while the best unsprayed lot averaged $1.43 per barrel, and spraying our figures have shown, increases the quantity of fruit a whole lot more than it increases the quality.

We are now at probably the most trying time in the history of the apple industry in Nova Scotia, and still we are selling apples at a profit. The competitor of Nova Scotia cannot continue selling apples in competition with us at less than cost, and it cannot be many years until we are in a much better position in regard to markets than we are now.

Last year the United Fruit Companies offered to place at our disposal one page of the "Co-operative News" which is sent to about 60 per cent of the fruit growers of the Valley. The Dominion Entomoolgist, Dr. Hewitt, welcomed this opportunity to place the latest and best knowledge of spraying before those most interested at the earliest possible moment, and in addition to our own articles we have been running a series of articles on spraying from Prof. Brittain, Prof. Caesar, C. A. Good, M. E. Davis and others, all written especially to suit Nova Scotia conditions and during the coming year the aim of our Laboratory staff will be to help in advising the Nova Scotia grower by this and other means how to produce the best fruit in the most economical manner, and so to win out in competition with other countries in the world's markets.

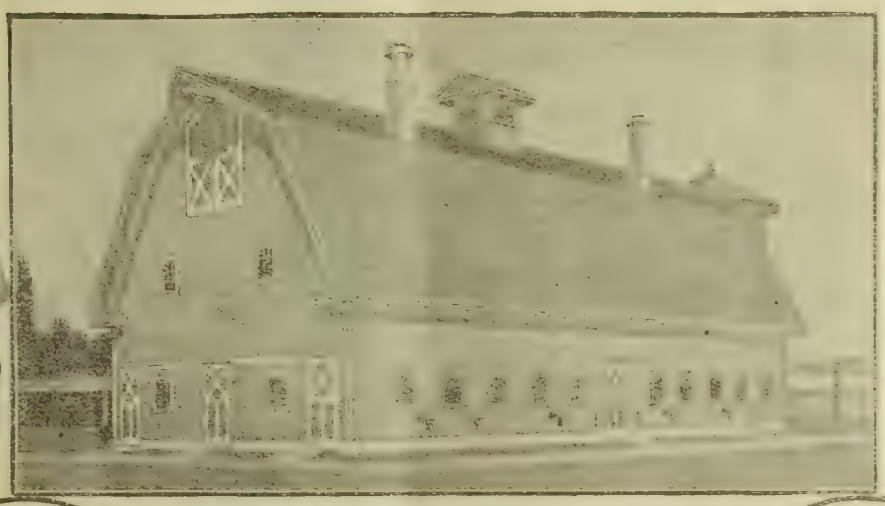
LOUDEN BARN EQUIPMENT

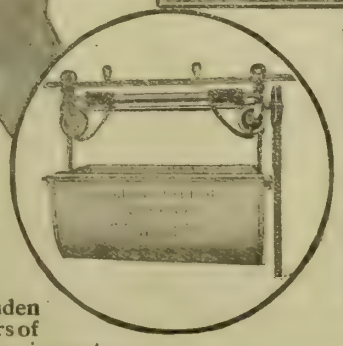
FOR QUALITY FOR SERVICE FOR SECURITY

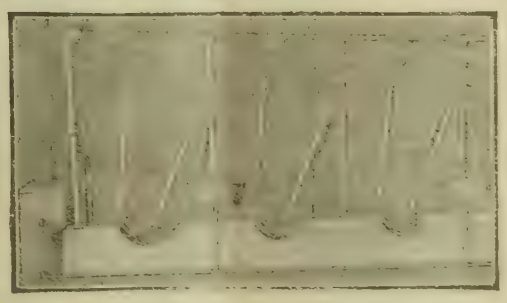
FILL OUT AND MAIL US THE COUPON FOR THIS FREE BOOK.

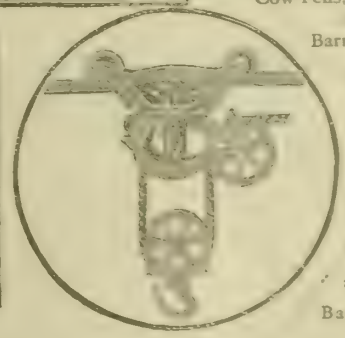


Book of Barn Plans Free

Louden "Barn Plans" is not a catalogue of barn equipment. It is a complete and valuable book of reference and instruction on barn construction. The 112 pages of Louden Barn plans is full of dollar saving information—the best of ideas gathered by the Louden Company during many years of barn building, and barn equipment experience. 51 representative designs for cow barns, horse barns, general purpose barns and hog houses. In addition, there are 32 pages devoted to general construction problems, such as concrete work, laying floors, roof construction, ventilation, etc.







Louden equipment makes possible a clean, sanitary barn with a minimum of expense for upkeep. When cows are transferred from dark, dirty barns to Louden barns, the milk flow often increases from 15 to 25 per cent. and the labour of caring for the herd is reduced from one-third to one-half.

The cost of of installing Louden equipment is surprisingly small, and is just as great an economy for the man with a half dozen animals as for a man with a hundred. The percentage of labour saved is the same.

The Louden Line includes:

Litter Carriers, Hay Carriers,
Feed Carriers, Cow Stalls,
Horse Stalls, Water Basins,
Cow Pens, Bull Pens,
Hog Pens,
Barn Door Hangers.

Eureka

Potato Planter

Catalog sent free

The Eureka line of Potato Planters is the largest manufactured. This machine takes only *one* man to operate it. That means less trouble and expense for *you*.

Opens the furrow—drops the seed any distance or depth required—puts on fertilizer (if desired)—covers up—marks for next row. Always accurate and automatic.

It's an easy machine to operate. The steel and malleable iron construction mean lightest possible weight and increased life of machine. Your repair bill will be practically nothing. Plants uniform depth at *all* times because plow is directly under the axle. Dropping mechanism in plain view of driver. Does not injure seed.

We supply planters in three sizes, for one or two rows—with or without Fertilizer Attachment.

For 16 years the Eureka Potato Planter has been successfully used throughout the world.

We also make Eureka Potato Cutters and the Eureka Mulcher and Seeder—a mulcher, smoothing harrow, cultivator, weeder, seeder.

PETITCODIAC, - N. B.

Pruning the Tree for best Results.

W. J. Green, chief horticulturist of the Ohio Agricultural Experiment Station, addressed a recent meeting of horticulturists on the subject of the "Rejvenation of old Apple Orchards" and in the course of his address he said that the first point to decide is whether or not the orchard is worthy of rejuvenation. A large proportion of the old and neglected orchards will not pay for the labor and expense that will be necessary to bring them to abundant fruitfulness, because the varieties are not such as will sell at fair prices on the market.

About the first step in the rejuvenation of an apple orchard is the pruning. The ordinary instruction is that the top and centre of the tree must be opened up so that the sunlight can get in. In most cases this is all wrong. When the average tree is bearing its load of fruit, its weight causes the branches to droop and spread apart so that all the light and heat of the sun that is necessary can get into the centre of the tree. If the tree is opened up so that the sun's rays are unobstructed when the tree is bare of fruit, the exposed branches are liable to sunscald, leading to their death.

O course dead and dying branches must be removed. Allowing them to remain is dangerous to the life, the health and the fruitfulness of the tree. But aside from these, it is seldom desirable to remove large branches. A general "dehorning" of the trees, which has been frequently recommended, is entirely unnecessary and should not be tolerated. When a large branch is cut from a tree, one or more water spouts usually start from near the end of the stub. These seldom amount to much as bearing wood and may soon die. In the latter event or in case none start, the stub becomes the same as dead wood and is a menace to the good health of the tree. If for any good reason it appears necessary to remove a large living branch the cut should be made just above another branch. The cut should be at a considerable slant from the horizontal with the point of the cut on the same side as the remaining branch, and the cut surface should be dressed with paint.

Aside from the above all necessary pruning may usually be readily done with the jackknife. It should consist largely in thinning out the fruit bearing twigs at the ends of the branches. Any water spouts which may appear should be removed before they reach much size. But few grow if no large branches are taken off.

Wanted—Potato Seed

Potatoes have been grown so long from cuttings that they are getting out of the habit of producing seed. Seed for breeding purposes is in demand and worth six dollars a thimbleful—when the thimbleful can be secured. Edward F. Gigelow, writing in The Guide to Nature (Sound Beach, Conn., January) tells an amusing tale of his efforts to obtain the seed of this exceedingly common food product. He has been told everywhere that it can be had "by the bushel," but he rarely finds it. In Maine he is informed that it is plentiful in Ohio, and in Indiana they refer him to Michigan. Experts tell the truth. Mr. Burbank's explanation is given above. William Stuart, horticulturist of the United States Bureau of Plant Industry, writes that the reason more seed-balls are not developed is that most potato-plants do not produce enough pollen capable of germination. Such pollen develops best in northern climes, and the seed-balls of potatoes are thus seen most frequently in Maine, northern Michigan and Winconsin. Writes Mr. Bigelow:

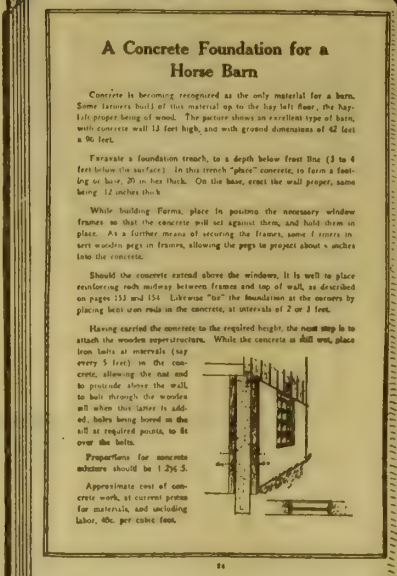
"Thirteen years ago I originated the annual summer school of nature-study at the Connecticut Agricultural College, Storrs, Connecticut, and was the director of the first session. One of the members of the staff at that session was Professor Gully, the horticulturist of the college. This expert in garden products made one day an astonishing statement that I thought was intended to be oratorical rather than literally financial. When discoursing in regard to the fruiting-berries of the common potato, he exclaimed: "All these berries have disappeared from the State. I will give twenty-five dollars for one found within Connecticut.'

"No more of that lesson that day for me. I did not expect to receive twenty-five dollars, but I wanted the satisfaction of proving that the professor was in error. Potato-balls? It seemed only yesterday that I saw them lying on the ground by the quart, the peck, the half-bushel! Potato-balls? I remember hurling them from the end of a sharp stick with almost the accuracy of a catapult.

"I slipt out of the class-room and hastened to the nearest potato-patch. Over an acre of ground, up and down between the rows I traveled, but if the prize had been one hundred dollars I should have received it not. No potato balls were there. Still, I was determined to show Professor Gully that he was wrong. When I returned home I hunted in my garden and in the gardens of other people. I haunted potato-fields and searched acres. I invited others into the work. I talked about it from the lecture platform in various parts of the State. At last came a letter and a package. 'Here, Mr. Bigelow,' said the letter, 'are fifty dollars' worth. I found these two hunting over an acre of potato patch, and I send them to you. Collect fifty dollars from the professor. You keep twenty-five. That will be fair to both.' With high anticipations I unwound the fastenings and removed the cover of that box; but how dissimilar to those great, round, smooth, tomato-like forms so familiar to me, just a few days ago, as it seemed, in boyhood's familiarity with the potato-patch! These were vestigial berries no larger than peas! So for thirteen years I have searched in vain to prove that Professor Gully is wrong, but he must still limit that claim to Connecticut, although it would not cost him a for-

Before You Build

WHAT THE FARMER CAN DO WITH CONCRETE



A Concrete Foundation for a Horse Barn

Concrete is becoming recognized as the only material for a barn. Some farmers build of this material up to the hay loft floor, the hay-loft proper being of wood. The picture shows an excellent type of barn, with concrete wall 13 feet high, and with ground dimensions of 62 feet x 96 feet.

Excavate a foundation trench, to a depth below frost line (3 to 4 feet below the surface). In this trench "place" concrete, to form a footing or base, 20 in. hes thick. On the base, erect the wall proper, same being 12 inches thick.

While building Forms, place in position the necessary window frames so that the concrete will set against them, and hold them in place. As a further means of securing the frames, some farmers insert wooden pegs in frames, allowing the pegs to project about 4 inches into the concrete.

Should the concrete extend above the windows, it is well to place reinforcing rods midway between frames and top of wall, as described on pages 153 and 154. Likewise "tie" the foundation at the corners by placing bent iron rods in the concrete, at intervals of 2 or 3 feet.

Having carried the concrete to the required height, the next step is to attach the wooden superstructure. While the concrete is still wet, place iron bolts at intervals (say every 5 feet) in the concrete, allowing the nut end to protrude above the wall, to bolt through the wooden sill when this latter is added, holes being bored in the sill at required points, to fit over the bolts.

Proportions for concrete mixture should be 1-2½-5.

Approximate cost of concrete work, at current prices for materials, and including labor, 40c. per cubic foot.

Concrete is the Best Material for a Horse Barn Foundation

In the first place, concrete foundation walls are cheaper—in first cost—than any other material except wood; and of course farm horses are too valuable for the owner to dream of depending on wood for their protection. As every farmer knows, animals attract lightning—and lightning causes fire. If your barn is entirely of wood, fire will quickly sweep it away, without giving much chance to remove the horses.

Concrete is permanent, sanitary and rat-proof. Concrete wall foundations make a building cool in summer and warm in winter.

Nowadays, the farmer shows his good sense, by being just as thoughtful of the welfare of his animals as he is of his own comfort.

To provide comfortable, cleanly quarters for horses or cattle, one must use concrete.

Get This Free Book

It contains 150 pages like those shown here—116 pages give practical instructions for improving your farm, explaining the most economical way to construct all kinds of buildings, walks, foundations, feeding-floors, walls, troughs, tanks, fence-posts, and 45 other things needed on every farm.

There are 14 pages of information vital to every farmer who intends to build a silo. 22 pages show what concrete is; how to mix it; the tools needed; what kind of sand, stone and cement are best; how to make forms; how to place concrete; and reinforce it, etc., etc. In fact it tells everything necessary to know about the world's best and most economical building material—*Concrete.*

This book is the recognized authority on farm improvements and has benefited 75,000 farmers.

PALPITATION
OF THE
HEART.

Sudden fright or emotion may cause a momentary arrest of the heart's action, or some excitement or apprehension may set up a rapid action of the heart thereby causing palpitation.

Palpitation, again, is often the result of digestive disorders arising from the stomach, or may be the result of over indulgence of tobacco or alcoholic drinks.

The only way to regulate this serious heart trouble is to use Milburn's Heart and Nerve Pills.

Mrs. J. S. Nicholls, Listowell, Ont., writes: "I was weak and run down, my heart would palpitate and I would take weak and dizzy spells. A friend advised me to try Milburn's Heart and Nerve Pills, so I started at once to use them, and found that I felt much stronger. I cannot praise your medicine too highly, for it has done me a world of good."

Milburn's Heart and Nerve Pills are 50c per box, 3 boxes for $1.25; at all dealers, or mailed direct by The T. Milburn Co., Limited, Toronto, Ont.

ADVERTISE IN THE MARITIME FARMER TO GET RESULTS.

tune should he extend to the United States in general.

"From the lecture platform in Teachers' Institutes in Ohio, Indiana, and Pennsylvania I have told the story of that startling announcement, and in most place I have offered a year's subscription to this magazine for a box of well-developed specimens. Last August I made the offer before more than two thousand teachers of Allegheny County at Pittsburg, Pa., and again in one of the county districts of southern Indiana. The announcement was received with general surprise and the remark: "We can send them to you by the bushel. We will bankrupt you on subscriptions." But of the thousands of teachers that promised to search the fields only about a dozen have responded, and no package contained more than eight or ten balls. Nearly all have been vestigal. In the thirteen years not more than thirty large, smooth, round, perfect specimens have reached me. As a result of my efforts during the past summer, I have obtained at a cost of six dollars less than a thimbleful of the seed.

"Now the question is, "What is going to happen to the potato-crop when no more seed is obtainable?' Most readers know that what we call the planting of seed-potatoes is the planting of pieces of potato to raise a new crop; it is really but a sort of cutting as one might cut twigs of willow and set them in the ground to produce new trees. Like grafting, it produces its own kind.

"But when we plant potato-seed it is like planting apple-seeds, for we do not know what will happen. The seeds seem to become insane and try to produce a little of everything. Fortunate is the experimenter that finds in the varied potato-seedlings some particular form that may be better than the original. I long ago gave up all attempt to attain fame and fortune by originating an early rose or something equally epoch-making, but I find it interesting to experiment with the seeds and I get kaleidoscopic effects that most conspicuously manifest themselves about the second or third year.

"These investigations have led to efforts to ascertain where in the United States the seed may yet be obtained. . . . . A number of correspondents have told me that Luther Burbank, of Santa Rosa, Cal., 'has planty.' Mr. Burbank throws the will-o'-the-wisp clear across the continent of Maine, and writes:

"The reason for the scarcity of potato-seed is that the potatoes have been grown from cuttings so long that it has given up its habit of going to seed.

"It is somewhat difficult to obtain potato-seed, but you can probably obtain it from some of the nurseries or seed-houses in Maine.'. . . .

"Here is what the Department of Agriculture of the State of Maine says:

"'I do not know of any one at present who is experimenting in growing potatoes from seed. The season has been so bad here in southern Maine that I have not seen any mature seed-balls. I have some at home in a little vial, probably several hundred. These are several years old, and I do not know whether they would germinate or not.'. . . . .

"The more extensive the correspondence the more one is inclined to agree with the great Dreer seed-house of Philadelphia when it writes:

"We regret to say that we are unable to furnish you with the potato-balls and do not know any source of supply for seeds.'

"Readers, this is an alarm-cry! Potato-seed is going from this country. All that can be obtained should be put at once into the hands of competent experimenters.

"What are we going to do when the present varieties of potatoes have 'run out,' and no more seed can be obtained?"—Literary Digest.

DAIRYING.

The Use of Starters.

It is not very long since the modern method of making butter and cheese originated. Previous to that, and in some cases at the present time, the resultant product was not all that could be desired. Merchants complained that there was lack of uniformity in the quality, with the result that they had gerat difficulty in giving satisfaction to their customers. Now, however, with the use of "starter," the butter-maker and the cheesemaker may control the ripening of the cream or the development of acidity in the cheesemaking process to such an extent that the production of a uniform article can be accomplished. In fact, success in butter and cheesemaking is only possible where the ripening process or development of acidity is properly controlled.

The Theory of Ripening

It is well known that milk or cream which is left exposed to the air will become sour and curdle. This acidity is brought about by the activity of the lactic acid bacteria which live in the milk, feed on the milk sugar or lactose, and ultimately change it into lactic acid. The lactic acid produced precipitates the casein, causing the milk to thicken or curdle. This development of lactic acid in the milk or cream is called the ripening process. These bacteria, being living things, are affected by variations of temperature. Towards freezing point they cease to be active factors, and with high temperatures they may be killed off. Between these two extremes at which they develop and multiply at a great rate, so that their activity would be greatest at about 85 degrees F. The golden rule to remember is that to hasten ripening one must raise the temperature as near the optimum as possible, while to retard it the milk must be cooled down to 50 degrees F., or in some cases less. Close attention to the temperature of the milk and cream during the ripening process is, then, imperative if a superior article is to be obtained.

But What is a Starter?

A starter is really a culture of the bacteria which change the sugar of milk (lactose) into lactic acid. These occur in sour milk, buttermilk, sour whey, cheese, etc., and the first three of these may be used in some cases for this purpose, provided they are net tainted in any way with other injurious bacteria. Commercial starters are now on the market, and can be had in either liquid or powder form; the former, however, is the one chiefly used in this country. These commercial starters are, or should be, pure cultures of the lactic acid bacteria.

How a Pure Culture is Made.

Take three tubes of nutrient gelatine, and keep at a temperature of 100 deg. F. to keep the gelatine liquid. Make a loop on the end of a platinum wire, and place a loopful of sour milk, wihch has a clean, sharp, acid flavor, in No. 1 tube, and stir after adding. Transfer a loopful of inoculated gelatine from No. 1 to No. 2, stir again, and do likewise from No. 2 to 3. The idea is to get the bacteria thinned out or attenuated in Nos. 2 and 3 tubes. The contents of Nos. 2 and 3 are poured into sterilized plates with covers on, and sperad evenly over the bottom. This is called "laying the plates," or practically "seeding" 'them. Each or at least several of these bacteria flourish on the nutrient gelatine, and by multiplication form colonies after their own particular kind, provided the temperature has been somewhere about 70 degrees F. After examining under a microscope, one of these colonies is selected and cultivated further on gelatine, agar and in sterile milk, to make sure that none other than the lactic acid forming bacteria are present. The required organisms having been isolated, is propagated from day to day in a suitable medium, like separated milk, which has been previously rendered sterile by heating, and this gives a pure culture.

Preparation of Starter

Take half a gallon of separated milk in a clean enamel pail. Heat to 170 deg. F., and then cool down to 84 deg. F. Into this, after shaking the bottle containing pure culture pour contents of bottle, and cover the pail with a muslin cloth. Set in a room which doesn't fall below 65 deg. F. for 24 hours. The milk should then be thick an dsour. Make a second or sub-culture from this by taking some more separated milk, which has been rendered. sterile, and after skimming off the top layer take, say, a pint from the centre of the first culture in first pail, and strain into it. Set as before. A third cultivation should be made, which will generally be quite satisfactory. Each day about a pint should be reserved for setting the culture to make the following day's starter. A good starter will contain .75 to .85 per cent. of latcic acid, and in order to get this, one needs to attend to the time of setting, the temperature of the milk to be inoculated, the amount of starter used, and the temperature of the dairy. Where a night temperature of 70 deg. F. can be looked for, good results can be obtained, by adding ½ to ¾ pint of previous culture to each gallon of scalded milk, and setting it at 4 to 5 p.m. With the dairy at a lower temperature, it must be set earlier. About mid-day answers well in some dairies.

Preparation of Home-Made Starters

Take two enamelled pails. In one pour newly separated or skimmed milk. Set in a warm place for twenty-four hours, when the milk will be sour and thick. Skim off surface, and break up the centre of this soured milk, then take about half a pint and add to milk in second pail, which has been previously scalded and subsequently cooled to about 65 deg. F. Make sub-cultures from this as mentioned above, when the third one should be a fairly pure culture. If the surface or any part of the starter becomes discolored, this part should be rejected, and only the pure white portion used. When the starter becomes weak, and does not sour the milk sufficiently, either more starter should be used, or a fresh, pure culture should be secured. It is advisable to prepare as much starter as will equal about one per cent of the milk to be inoculated. After setting the culture for next day, it should be stirred occasionally in the evening. "The preparation of home-made starters does exert a purifying influence on the bacterial content of starter, and results in the elimination of bacteria, which are unnecessary, if not harmful, to the production of a first-rate article."

Character of Bacteria Used in Starter.

They should resemble those found in ripened cream or in good cheeses, and they should by no means have a clean, sharp, acid flaovr, and when added to milk or cream should be capable of eclipsing, to a large extent, the development of obnoxious bacteria. They should neither liquify gelatine nor produce spores, and when examined under the microscope should occur in pairs or figure eight as short bacteria with rounded ends.

Wise Dairymen Frequently Use Tuberculin Test.

Owners of dairy herds should not wait for authorities to compel them to tuberculin test their herds. The prudent and sagacious man keeps his herd free from tuberculosis. It is to his advantage to do so. It is his loss when he does not, writes ex-Gov. W. D. Hoard of Wisconsin.

A community has a right to demand clean, wholesome dairy products. It cannot force a person to tuberculin test his cows, but it can keep him from marketing his products unless they come fro ma herd free from disease. It is quite true that reforms are apt to be carried too far and to contain many things which are impractical. It is not possible for a province of a city to send out men to test cows and if reactors are found eliminate them from the herd and in this way clean up the diseased animals, unless they have the co-operation of the owners to follow out certain principles necessary to free a herd from tuberculosis.

Perhaps it would be well for us to discuss a few things that should be done and to indicate the limitation of the tuberculin test and the nature of tuberculosis. In the first place, tuberculosis is a germ disease. An animal cannot develop it unless it comes in contact with the germ. A herd may

For Every Farm and Dairy there's a Labor-saving "EMPIRE" Machine

EMPIRE Mechanical Milkers: Remove the grind of daily milking—make their owners independent of hired help—induce the cows to let down more milk—protect the milk from dirt and germs.

EMPIRE Disc Separators: Have exclusive features which give them the lead over all others in mechanical excellence and close skimming.

BALTIC Separators: Are high-class small machines for the man with a few cows. They sell at from $15. to $45.

EMPIRE Gasoline Engines: In sizes from 1½ to 16 H. P. Stationary and portable—are simple and easy to run—sturdy and durable—saving on gasoline—and pay for themselves many times over. The workmanship and finish of Empire Engines delights everybody.

be kept in dark, close, foul stables but will not develop tuberculosis unless the germ is present. Such an environment, however, weakens an animal and creates a condition which makes it easier for the germ to develop and, as the saying goes, for the herd to catch tuberculosis. It is for this reason that we urge well lighted and well ventilated stables. Light destroys germs, and fresh air is necessary for healthy cattle.

The tuberculin test is the only diagnostic agent for tuberculosis. It is impossible for a person to eliminate tuberculosis from a herd by physical examination. There are no symptoms which alone characterize this disease. Because an animal coughs is no sign that it has tuberculosis, nor because it is thin in flesh does it follow that the disease is present. On the contrary, an animal may be fat and have tuberculosis. It is unfortunate that tuberculin does not point out the disease during the incubating stages or show animals that are infected. It can be said that when an animal is properly tested with tuberculin and a characteristic rise and fall in temperature follows, there is little question but that the disease is present. Then, too, an animal may be so far advanced with the disease that she will not respond to the tuberculin test. In such cases a physical examination will usually determine the presence of the disease.

The use of tuberculin in many instances has been misunderstood. It is thought by not a few that if a herd is tuberculin tested and the reactors eliminated, that the herd is clean of disease. This is not the case. There may be several animals in the herd that have been exposed but do not react, for the disease in the incubating stage is not revealed by the tuberculin test. When reactors are found in the herd a retest should be made in six months. It is held by many that when 50 per cent of a herd responds to the tuberculin test it is safe to consider all the herd tubercular, for sooner or later the other 50 per cent are almost certain to develop the disease.

In such instances as this, and where it is desirable to raise the calves of the cows reacting, it is well to follow the Bang System. This system provides for the separation of the young calves and does not permit them to drink any of their mother's milk unless it is pasteurized; that is, heated to a temperature of 150 degrees F. and kept there for twenty or thirty minutes. Care should always be taken to prevent the carrying of the infection from the mothers to the calves.

The question is frequently raised as to whether tuberculin injures a cow. It may be said that the cows on our own farm have been tested for fifteen or more years. Some of the cows at the present time are fifteen years old. They have received tuberculin for thirteen or fourteen years and are still in good health. In all our experience we have never seen any injurious results following the use of tuberculin. Doses forty times larger than is necessary for testing purposes have been given cows before any symptoms of sickness followed. It is understanding these few principles thoroughly and following them out that will in time rid a herd of tuberculosis.—Hoard's Dairyman.

Noiseless HAND

A SILENT WORKER AND ALWAYS READY

The NOISELESS is far and away the easiest to operate Dolley Type hand washing machine on the market. There are no wheels, cogs or springs about it to get out of order. It does the work perfectly, quickly and is a wonderful labor saver. Investigate it at your dealers or write us direct.

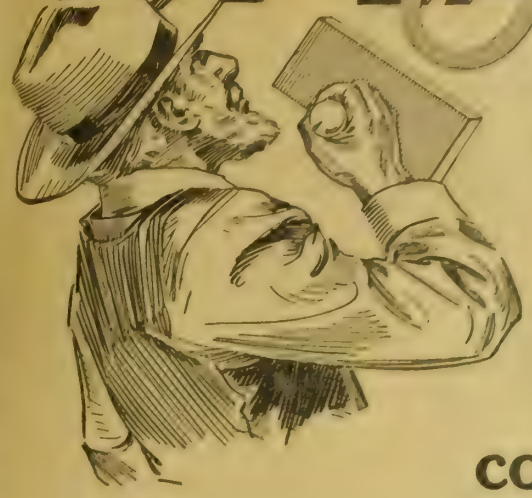
DE LAVAL



O.K'd by nearly two million cow owners

MORE De Lavals are being sold than all other makes combined—nearly 2,000,000 are now in use. Year by year an ever increasing proportion of farm separator buyers reach the conclusion that the De Laval is the only cream separator they can afford to buy or use.

In fact, about the only excuse ever offered for buying any other separator nowadays is that its first cost is a little less than the De Lavals.

But they soon find out that the last cost of a cream separator is what really counts, and when they realize that the De Laval gives the most and best service for the money they buy a De Laval.

Over 40,000 users of inferior machines discarded them for De Lavals during the past year in the United States and Canada alone.

Better be right in the first place and start with a De Laval.

Ordinary Steer Not Profitable Animal to Feed.

The wisdom of growing baby beef, and the unwisdom of trying to carry steers too long and then sell them without being finished were points emphasized before a large gathering of visiting breeders and cattlemen, at the Ottawa Winter Fair recently, by Prof. George E. Day, of the Ontario Agricultural College, Guelph.

Prof. Day declared that it would cost 11 cents a pound to put flesh on a steer bought to feed and properly finish him for market, charging up the various items at current market prices. Yet beef was selling at two or three cents a pound under that amount, and the result was that amount of loss. The loss would have to be made up, he went on, dealing with this class of feeders, be increasing the weight and economizing on feed.

Continuing, he said that the market for beef was extremely unsatisfactory. The farmer was taking more or less of a gambler's chance, besides, for he was speculatinng on what the market would be in three or four years. The price of feeders must come down, or there must be an increase in the price of fattened cattle, or a more stable market for them. If not, beef farmers must not expect to get satisfactory results.

Prof. Day would not say that the steer bought for feed was not a profitable animal; all knew that he made less labor and expense than the dairy animal, and this was what kept many of the men in the beef business. Some men bought right, and finished right, theerby making a profit, but many did not, the reason being that most men were not the best judges of feeding cattle. Another reason was that many cattle were put on the market in an unfinished condition.

He ofter found people making a comparison between the prices on the American and Canadian markets, but they should not do so, as the corn belt animals were different, and finished differently from Canadian. A visit to the Chicago meat market would impress anybody, he declared, with the degree of finish on the American steers; while the Canadian finished steers, by comparison, looked like just good feeders. Lack of finish was characteristic of Canada. This sounded blue, but nevertheless, he wanted to emphasize the necessity of more farmers finishing their cattle well.

An important point in regard to marketing, made by Prof. Day was that the man who fed the cattle should put them in a car and market them himself, instead of selling them three or four months before, to a buyer who was only concerned in selling them; this was one of the main reasons for the low price.

He belived there was a bright side to the question, however, and higher prices meant more breeders. This could be found in the production of baby beef. The young animal was growing all the time, and, if the market was not good at the moment, he could be held without increasing the cost of care and feed out of proportion to the value of the gain he would make. Not so with the steer bought to feed, however, for to hold him meant small gain at heavy expense.

In this province, said Prof. Day, there was a good opening for the producer of baby beef, in fact, the opportunity was the most promising of any branch of the beef industry. The animals must be bred right, and he believed the time was coming when the feeders of beef steers would also be breeders. The care must be of the very best, and the young animals must not know want from birth to market. The farmer who thought he could not afford to put a little extra feed into his calf would not make good in the beef business.—O. V. T.

Still Singing Their Praises

DODD'S KIDNEY PILLS CURED HIS RHEUMATISM

Mr. D. A. Brotherston Tells How His Rheumatism Disappeared Over a Year Ago and Has Never Come Back.

Victoria Harbor, Ont., Fberuary 21st. (Special).—Cured of rheumatism over a year ago by using Dodd's Kidney Pills, Mr. D. A. Brotherston, a well-known resident of this place, is still singing the praises of the great Canadian kidney remedy.

"I was troubled with rheumatism in my left hand, which would shift to my elbow and then to my shoulder," Mr. Brotherston says. "It was very annoying and painful at times, but I heard of Dodd's Kidney Pills helping others, so I quit the liniment I was using and took six boxes of them. The rheumatism disappeared. That was over a year ago, but it has not returned.

"I know Dodd's Kidney Pills are good for kidney trouble both in my own case and through others who have used them."

Rheumatism is caused by uric acid in the blood. If you cure your kidneys by using Dodd's Kidney Pills they will drain all the uric acid out of the blood and there can be no rheumatism.

Scabby Mouth in Sheep.

There exists some confusion as to the exact nature of the scabby mouths and noses so commonly found in sheep and lambs, often affecting a number of animals at one time, and there is certainly difficulties attending diagnosis even when there is opportunity for personal examination. A postular eruption assuming various forms, called impetigo larvalis, affects the face and lips of sheep, due, it is supposed, to the presence of irritant substances in the animal's fodder, but there is no doubt that the majority of such cases, possibly all of them, are due to parasitic invasion, and are real

UNDER WATER 4 YEARS AND NOT RUSTED
Think of it! A galvanized fence so thoroughly galvanized that four years of submersion—summer and winter—could not faze it. That's Mr. Cummings' experience with Peerless Fence. Read what he says. Here's his letter.
Gentlemen—I have handled your fence for four years and find it a good, strong and durable fence, and find that the galvanizing is first-class. In referring to this I have a fence that I put on four years ago across a gulley and the water is as high as the second wire and it is not rusted nor broken yet. I have a team of heavy horses that ran into the fence last summer and did not break or damage it in the least, and I am glad to say that in the four years I have handled your wire I have had no complaints about it.
Yours truly, DAVID CUMMINGS, Bowesville, Ont.
Incredible—unbelievable—you say? Not when you remember that
Peerless Perfection Farm Fencing
is different—that it is made of Open Hearth Steel Wire. The Open Hearth process burns all the impurities out of the metal, thus removing one of the greatest causes of rust. The wire is also galvanized so thoroughly that it will not flake, chip or peel off. Every intersection of the wires in our farm and poultry fence is locked together with our Peerless Lock. While these locks hold the wires securely together, this fence can be readily adjusted and perfectly stretched over uneven ground. It is easily erected and on account of heavy, stiff stays used, fewer posts are required. Get the details. Send for free literature. It also describes our farm gates, poultry fencing and ornamental fence.
Agencies nearly everywhere. Agents wanted in unassigned territory.

ly a slowly-extending form of mange or scab—Sarcoptic scabies. Writing of this form of scab, Steel ("Diseases of the Sheep") says:—"Youatt mentions, as described under the name 'black muzzle,' an eruption seen both in Great Britain and on the Continent, consisting of pimples and scabs about the nose, sometimes extending to the eyes and ears, encircling the former and covering the latter. It was thought to be 'non-infectious' or not readily communicable, and was found to be readily cured by application of mercurial ointment (one part) diluted with 11 parts of sulphur ointment. Thus Youatt seems to have been acquainted with the disease known in France as noir museau, information concerning the true nature of which has been introduced into this country by Dr. Fleming. Its first indications are found on the upper lips, around the nostrils, rarely on the eyelids, and around the ears. There is intense pruritis, and on examination may be discerned well-defined vesicles with red areola. The animal licks the lips and scratches the diseased parts with the fore and hind limbs. Thus the vesicles become broken, a yellowish discharge escapes and dries to a hard crust." For cases of "scabby mouth" the following treatment has been found successful. It consists of an ointment made by mixing as much finely powdered sulphate of copper (blue stone) with a quantity of lard as it will take up. This is applied to the sore muzzle after breaking down the crusts with the blunt edge of an old knife. It would be well at the same time to give each sufferer a dose of Epsom salts and change the food.—Veteran in English Exchange.

The Nova Scotia "Lumber King" says:

"I consider MINARD'S LINIMENT the best LINIMENT in use.

I got my foot badly jammed lately. I bathed it well with MINARD'S LINIMENT and it was as well as ever next day.

Yours very truly.
T. G. McMULLEN.

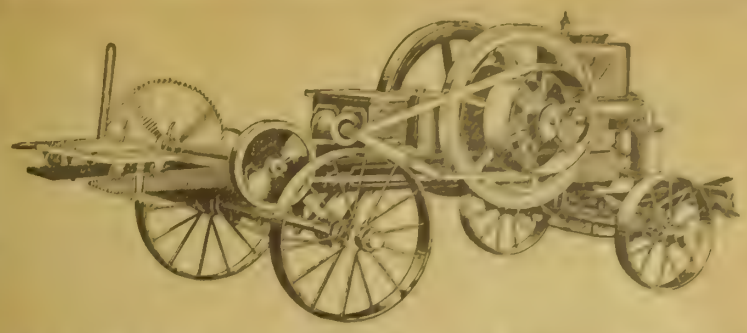
Rheumatism in Swine.

In northern latitudes, rheumatism often occurs among swine, especially during cold, damp weather. Damp, ill-ventilated pens are a common cause, and it may be caused by over-feeding. Piggeries built with stone or concrete walls and floors are generally more dangerous than those built of wood. When such walls are hollow and the floors insulated with a tar layer, they are much safer. The hog becomes very lame and stiff and moves about with difficulty. Sometimes the points becomes swollen and very painful, and the animal becomes practically helpless. In such cases it is seldom that the hog recovers.

The feeder must be on his guard against this disease. Dry, well-ventilated pens and careful feeding will generally enable him to avoid disaster. Animals which become affected should be kept in dry, warm quarters. Dr. Craig ("Diseases of Swine") says: "Salicylate of soda is the most useful drug to give in this disease. The dose is twenty or thirty grains in the feed, or as a drench, three times a day. Larger doses, and at more frequent intervals, may be given in acute cases for a short time. Quinine and bitter tonics can also be given. Blistering ointments and liniments should be applied to the inflamed articulations."—G. E. Day, Ontario Department of Agriculture.

Averaged Size Sows Best.

Where many make a mistake in the selection of breeding stock is in choosing those animals which possess the greatest size, regardless of quality or conformation, writes Mr. J. Carmichael, University of Illinois. It is frequently the case that the larger ones are the more profitable, but year in and year out they are not as profitable in the production of market hogs as are the average-sized sows. The average-size sows may not farrow quite as many pigs as those above the average in weight, but they will save a larger per cent. of pigs farrowed, and the offspring will almost invariably be more uniform. Take, for instance, in the herds where they are raising annually about 1,500 pigs, it is the general experience that the extreme sized sows are the most unprofitable and more expensive to handle on account of the greater amount of feed consumed, and the extra labor and space required to care for them. The other extreme—that is, the small, midget female—is also to be avoided, because she will likely produce a very small litter, and the pigs must be kept a long time before they are heavy enough to market to a good advantage."



ALPHA Rigs Saw More Wood at Less Expense

Freedom from weak complicated parts—low fuel consumption—ability to run steadily in the coldest weather—plenty of power to pull the saw through wood of any size that can be brought to it—these are advantages that are making friends for Alpha Sawing Rigs wherever they are used.

Whether you want an outfit to saw wood for your own use only, or to do work for your neighbors, or both, you cannot find a more efficient, economical, or more satisfactory all-round rig than an Alpha. The cost for fuel is the lowest. Its construction is such that time and money wasting delays are eliminated. You can depend upon it to run steadily all day long on either gasoline or kerosene, even in the coldest weather.

The above illustration shows one of our special steel frame mounted sawing outfits. Let us know what your needs are and we will be glad to quote you prices and send complete description of a rig such as you wish.

THE HORSE

Shaping Colts Feet an Important Work Never to Neglect.

Remember the Old Saying That "as the Twig is Bent the Tree Inclined."

It is a bright and true saying that "as the twig is bent the tree's inclined" and this is as applicable to the foot of the colt as it is to the historic twig. The time to start shaping the foot of the colt is as soon as the first irregularity of shape or growth is apparent. To illustrate this point I will say that if the colt shows a disposition to carry most of its weight on the heels, thereby premitting too long a growth of toe, the toe should be cut back if possible to correspond with the heel bearing. If this is neglected, as the colt attains age and weight, the tendency is toward undue straining of the tendons of the leg and a lowering of the pastern to a point where later in life it is quite impossible to ever overcome the defect.

Then, too, the foal may show a tendency to wear away the feet on the inner side, causing toeing-out. In this case it is self-evident that the foot should be at once trued or leveled by carefully trimming the outer wall of the hoof to a level with the inner. Should the colt show a disposition to wear away the outer wall of the hoof. the above work would simply be reversed, that is, cut away the inner and true to the outer wall.

Relative to the great importance of this work I will say that one of the most successful breeders and exhibitors of horses today in the United States has his colts in the blacksmith shop with their dams once every two months, when both the feet of the colts and the dams are carefully trimmed, and frequently light shoes or plates are fitted to the colts when they are four or five months old, when the foot shows a persistent tendency toward irregular growth.

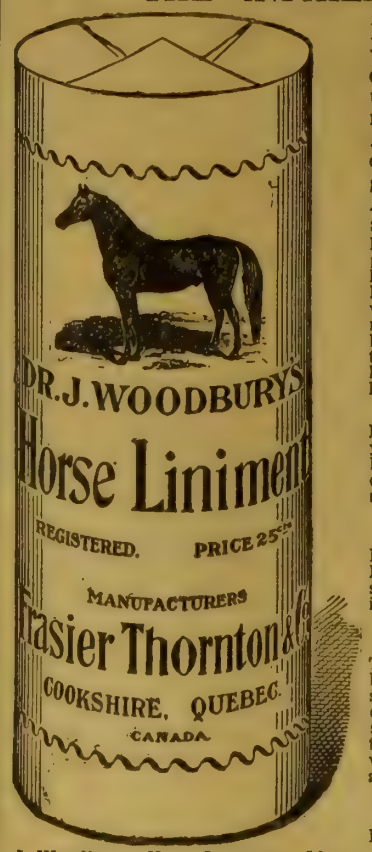
How Trimming Should be Done.

For the first four or five months of the life of the colt the hoof can readily be trimmed with an ordinary jackknife, and thereafter an ordinary pair of blacksmith's cutting pinchers is the only tool needed. These should be found on every farm in this country where colts are raised and be used regularly in keeping the feet of all the horses on the farm in proper shape, which adds not only to their comfort, but to their personal appearance and value as well, for there is no horse that is not as poor as his feet.

The wall of the hoof is that portion which surrounds the foot, and is alone seen when this is placed on the ground. It is fibrous in structure, the fibres passing from above to below, as they grow from where the skin terminates. Externally, the fibres are dense and resisting, but those nearer the interior gradually become soft and spongy. The growth of the wall is indefinite, it being the part which has to sustain wear through contact with the ground.

When the foot is lifted, the sole and frog are seen on its lower or ground surface. The sole is usually more or less concave in a healthy foot. It is fibrous like the wall, its fibres passing in the same direction, but they are much softer and their growth is definite breaking off in the form of flakes when they have reached a certain length. The frog is a triangular mass of somewhat soft and elastic fibrous horn, situated at the posterior part of the sole. Like that part, its fibres are also of definite growth and flake off in large patches from time to time. The wall sustanis weight and wear on all kinds of ground; the sole is adapted for sustaining weight on soft ground more particularly, while the frog has a most important use in acting as a cushion to support the powerful tendon which flexes the limb, in diminishing jar and in preventing slipping.

Dr. J. Woodbury's Horse Liniment
THE INFAILLIBLE REMEDY



For the removal of Splints, Bog Spavins, enlargements of any and every description it has no equal. Given internally, it will promptly relieve and remove any and every character of Cough Enlargements of the Glands, Affections of the Kidneys. For distemper, strangles, and colic it is infallibly the remedy All horses that are stabled should have an application of Dr. J. Woodbury's Horse Liniment to the hoofs of the forefeet to prevent their becoming feverish, dry, brittle, hard, contracted or otherwise injured Insist on having Dr. J. Woodbury's Horse Liniment. We warrant it to effect that for which it is recommended when used according to directions. Its beneficial effects are so prompt and decided that it has excited the admiration of the leading horsemen of the Dominion and secured their highest confidence.

Bear River, N. S.
Dear Sirs:—We do not hesitate in recommending your Dr. Woodbury's Horse Liniment. We have used it in the woods for coughs, colds. distemper and cuts and would say that no lumberman should be without it.
Yours truly, Clarke Bros.

Hubbard's Cove, N. S.
Dear Sirs:—I have used Dr J. Woodbury's Horse Liniment in my stable for years and consider it the best liniment on the market for both internal and external use.
Yours truly, C. C. McLean.

Truro, N. S.
This is to certify that I have used Dr. J. Woodbury's Horse Liniment with the very best results for colds, coughs, distemper and all lung deseases. It is the best to give horses in the spring to keep them in condition. It purifies the blood, cleanses the lungs from impurities which may exist and gives the system healthy action.

Blistering Horses.

Blistering is a method of treatment in cases of chronic lameness that the horse owner generally wishes to make use of, without the aid of the veterinary surgeon, using either a proprietary preparation or a vesicant copied from some old book, but he rarely is thoroughly conversant with the precautions to be taken to prevent injury to the animal operated upon. Assuming the necessity or desirability of blistering (which by no means exists), and the suitability of the vesicant as regards its constituents and strength, the first step is to clip closely the part to be blistered. The reasons for this is that less material is required, better contact with the skin is secured, and as the blister raises bladders or vesicles from which when broken there is some discharge, the hair does not mat together as it would if left unclipped. A blister acts powerfully or otherwise, according to the strength of the vesicating agent in proportion to the vehicle, the vigor, and length of time during which it is rubbed in, and the tenderness of the part, while occa-

sionally individual peculiarity has an influence.

Precautions to Take

Care should be taken to avoid blistering the flevures of joints either by rubbing in the ointment or by permitting it to come into contact wtih those surfaces. Here the skin is thin, and blistering is apt to occasion cracks that have a tendency to ulcerate, and are difficult to heal on account of the constant movement of the joint. The front of the hock, the back of the knee, and the hollow of the heels should always be thickly smeared with clean lard before any blistering agent is rubbed into parts adjacent to them. Do not remove the shoe from the foot of the limb about to be blistered, or until the soreness has passed off, as the horse is most intolerant of pain, and will kick the wall or stallpost with his hind feet, or stamp, scrape and paw the ground with his fore ones, breaking and doing serious damage to his unprotected hoofs. Never blister a horse "all round," that is, all four limbs at once, which is sometimes done with the idea of "freshening his legs" or "straightening him on his pins." This is real cruelty and ought to be punished as such. If it is ever necessary to blister all round, the two fore or two hind limbs, or one of each crosswise, should be seelcted, and the others deferred until the pain and soreness of the first application has passed off.

Protection Against Self-Injury.

Short litter or sawdust should be provided until the blistered surface has healed, as the ends of stiff straw irritate the wound. As the horse is not permitted to lie down when blistered there is no necessity for a thick clean bed, and whatever is supplied is sure to be disturbed by pawing and stamping. The animal must also be protected against attempts to injure himself. There are very few parts of his body that a horse cannot get at wtih his mouth, and if this is permitted a twofold injury may result. The lips may be blistered by transference of a portion of the material to them, and the horse rendered unable or unwilling to feed, while if the horse gnaws the blistered surface with his teeth, which he will do if he can get at it, a permanent blemish may likely result. It is not sufficient to prevent a horse getting at the blistered part with his mouth—care must be taken that this is not brought to the lips. Horses blistered in front, unless the head is tied high and short, will lift the limb to meet the mouth. For general purposes, and after the worst of the irritation has passed, the appliance known as "a cradle," which fits round the neck so that the head cannot be lowered or turned towards the flanks to any great extent, is ample protection. A cradle can be purchased from any veterinary instrument maker, but an appliance quite as useful, if not so neat, can be constructed at home out of broomsticks and cotton spools and some stout cord. With a properly fitted cradle, the blistered animal can be given a great deal of liberty, can feed from the rack or manger, and may be let loose in a box or yard much sooner than otherwise would be the case. This is often most advantageous, as walking about tends to reduce the swelling that frequently follows active blistering, and permits of the animal resting its limb by lying down. Blisters should never be rapidly repeated, for if this is done sloughing of the skin results, and there is a premanent blemish consequent on destruction of the hair follicles. In cases of chronic lameness time should be allowed for the hair to begin to grow again before a blister is repeated.

Treatment After Blistering

When the blister has done its work the next step is to assist the desquamation. The result of a severe blistering is peeling of the skin, which comes off in scruf and scales, and with it the hair, and to promote this the surface should be freely dressed with Carron oil (equal parts of linseed oil and lime water) or lard. In cases where a strong cantharides blister has been used the surface should, however, be first washed with warm water and soap. The reason for this is that cantharidine, the active principle of the blister beetle or Spanish fly, is soluble in oil, and the application of grease would rouse the blister into activity again. Unless there has been sloughing from too frequent repetition or the use of too powerful or unsuitable agents, the hair soon grows again, and invariably with renewed vigor, for all vesicants are hair stimulants. Rest is, of course, always essential, not only during the active stage, when it would be downright cruelty to work the horse, but afterwards, if the best results are to be obtained; indeed, there is reason to believe that much of the benefit attributed to blistering and firing is really due to the rest that accompanies these operations.—R. P.

Realize the Value of Your Farmyard Manure

Of course you use all your stable and stall manure—sometime or other. But does it first lose its value by leaching and firefanging?

Everything Depends on How it is Used!

Bulletin 223, issued by the Ontario Department of Agriculture, proves the importance the Department places on farmyard manure, and how it is used.

There is a book published called "Helping Mother Nature, The Value of Manure and How to Utilize It." It's a revelation of how much a farmer can add each year to his profits. It will help every farmer who reads it. We have reprinted it (six chapters) for FREE distribution.

First thing you do, cut out the coupon below, fill in your name and address and mail to us. By return of mail you will receive a copy of the book that will make you see manure in a new and profitable light.

NISCO Spreaders

Save Labour! Earn You Money!

The Nisco has cut down the actual work of fertilizing to a minimum and insures a wide, even spread of finely pulverized manure. Every turn of the wheels earns you money.

Breeding for Egg Production.

Those wishing to keep chickens only for egg production would do well to select an egg breed like the Leghorns, Hamburgs or Anconas. The Leghorns are probably the best of these. There are many varieties and sub-varieties in this breed, but the White variety stands out in a class by itself. These are just as good egg producers as any and besides they are almost the ideal broilers. The Leghorn is a bird of graceful curves, alert, active, hardy and prolific. They have no standard weights. They are probably better summer layers than winter layers as they are somewhat sensitive to weather conditions. Cold weather, long continued, will check egg production more in this breed than in the general purpose breeds, but on the other hand they also respond quicker after milder weather comes on. Where summer eggs are the chief consideration, together with a breed adapted for broiler production, we cannot do better than recommend the Leghorns.

The Anconas are a Leghorn-Minorca cross and are but little grown in this country. Type and general qualities are very similar to the Leghorns. The Hamburgs are a rounded and plumper bird than the Leghorn, but they are rather difficult to raise through their first few weeks of existence. The Minorcas have nothing to commend them to the ordinary farmer. The old time Minorca might have been a fairly good chicken, but the present day Minorca with his long, narrow body, long legs and lack of constitution has very little to commend him to any one but the straight fancier. His constitution and egg producing qualities have been spoiled almost entirely by trying to breed to fancy qualities only.

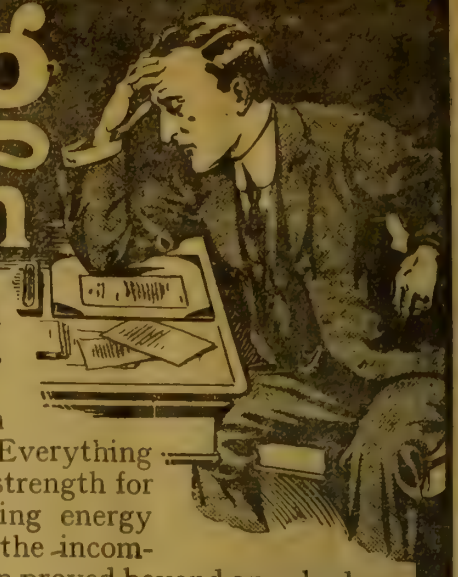
The meat breeds are too slow to mature to be of much use in this country. The large amount of feather growth on the feet also goes against them, especially in the early, wet fall and spring months when they are liable to freeze their feet. Small flocks may work out all right, but for an average size farm flock they would require too much care and attention. For crossing on other breeds the Brahma is probably the best. Crossed with Barred Rocks they make pretty good roasters and excellent capons. However, there is no special need to go into detail about the qualities, type and so on of these breeds as they are hardly adapted to farm requirements.

What we have stated about various breeds are facts as we have been able to gather them during the last twenty years of experience in farm poultry work, working on large poultry plants and also clolege poultry plants. We have endeavored to give an impartial summary of these observations not on the basis that we know it all and this is the final word, but rather that we came to these conclusions gradually and that as the years go by and wider experience is gained, we may from time to time make further observations and draw further conclusions in regard to the qualities of the various breeds of poultry.

Breeding for Egg Production

In breeding for egg production the farmer should select his best winter layers and mate them with an active vigorous male bird that grew quickly and matured early. The hens should of cousre be selected not only for heavy production, but also for vigor and vitality. If the hens are rather large and oversize a medium sized male will do, but this averaging up has to be taken into consideration. It is best to discard hens that are very much undersize because there is always a tendency in the offspring to deteriorate in size year after year, if such birds are used promiscuously.

Brain-Fag and Exhaustion



Tired, Nerve-jaded Folk Find New Strength and Living Energy in Dr. Cassell's Tablets

There is nothing in medicine more certain than the strength-giving power of Dr. Cassell's Tablets. Everything they contain makes for strength and vital power—strength for nerves and muscles, richness for the blood, living energy for the whole system. In every part of the world the incomparable efficacy of this great British remedy has been proved beyond any shadow of doubt. Dr. Cassell's Tablets can and do bring health and vigour to the weak—often when every other means has failed. They brace up and reinvigorate all the bodily organs, restore their natural action, and build up new health and fitness for the worn-out man or woman. They are equally suitable for children, even for infants.

Sir John Campbell, Bart., C.B., formerly Major-General in the Royal Artillery, said :—" I have pleasure in stating that I have derived great benefit from Dr. Cassell's Tablets, and have found them remarkably effective in restoring the nerve energy and physical vigour which advancing years naturally impair. They suit me admirably and I have every confidence in recommending them as a safe and reliable bodily restorative."

Dr. Cassell's Tablets are Nutritive, Restorative, Alterative, and Anti-Spasmodic, and of great Therapeutic value in all derangements of the Nerve and Functional Systems in old or young. They are the recognised modern home remedy for Nervous Breakdown, Nerve and Spinal Paralysis, Infantile Paralysis, Rickets, St. Vitus' Dance, Anæmia, Sleeplessness, Kidney Disease, Dyspepsia, Stomach Catarrh, Brain Fag, Headache, Palpitation, Wasting Diseases, Vital Exhaustion, Loss of Flesh, and Premature Decay. Specially valuable for Nursing Mothers and during the Critical Periods of Life.

Druggists and Dealers throughout Canada sell Dr. Cassell's Tablets. If not procurable in your city send to the sole agents, Harold F. Ritchie & Co., Ltd., 10, McCaul Street, Toronto; one tube, 50 cents, 6 tubes for the price of five. War Tax Extra, 2 cents per tube.

Try an Ad in the FARMER

Under farm conditions it would be worth while to take 15 or 20 of your best layers, or hens that are laying in December and January and separate them from the rest of the stock and trap nest them. In this way the best layer could be found and her eggs marked and her cockerels kept for breeding purposes the next year.

I firmly believe that the average farmer has in his flock the nucleus for a heavy laying strain only he does not know where she is. The cockerels from this heavy laying hen should then be mated back again to the next winter's heaviest laying pullets and the following winter in his second year back to his own pullets, using his son, which should be from the heaviest laying pullet, to mate back to the yearling hens. This is the best method of breeding and selection I know of and if a farmer is fortunate enough to own a flock of pure breds to start with he can soon build up a heavy laying strain of his chosen breed. Where mongrels are used to start with, pure bred males should be purchased the first year or two until the flock becomes uniform as to size and color and then this method of breeding and selection should be followed.

Our own experience in this line of breeding has been this, that with the use of the trap nest for identifying heavy layers and breeding from them only the production was raised from an average of 139 eggs a year up to 167 from the 25 best layers. Inbreeding was followed and later on line breeding and selection will lead us to we shall see as the years go by. If we give due consideration to the importance of having only strong vigorous and healthy birds to breed from we are satisfied that the question will work out all right.

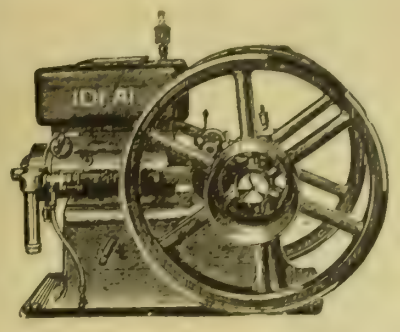
Investigation work has shown that heavy laying is transmtited by the male birds and therefore farmers generally would do well to use male birds from recognized laying strains. Such birds can usually be purchased at two to three dollars each whereas males from exhibition stock very seldom sell for less than five dollars.

It is often claimed that for best results yearling hens should be mated with cockerels and yearling males with cockerels and yearling males with pullets, but it is difficult to state that such will always be the case. Personally, I believe that environment, method, kind of food fed and general care play a bigger part in the results, providing that the pullets and cockerels are mature, than any special way of mating. As a rule though the yearling hen produces a larger chick, fluffier and apparently more vigorous than the pullet for the simple reason thta she lays a bigger egg. If pullets are mature, healthy and vigorous I would expect, other things being equal, to get just as strong chicks from them as from the yearling hens.

The period of usefulness of the male from a breeder's point of view usually extends over the second year. The number of females to be mated with a male for best results decreases year after year. A male generally passes his period of usefulness after the third season. The number of females to go with one male depends somewhat on the breed. In the egg breeds one male to every 15 to 25 hens is about the right ratio; in the general purpose breeds one to 12 to 15 females; and in the meat breeds one male to 8 to 12 females. These ratios may vary with some individuals. A specially active vigorous male in the lighter breeds will often fertilize the eggs from as high as 35 hens and in the general purpose breeds as high as 25 hens. Usually on the tenth to the fourteenth day after the male is put with the females the eggs will be quite fertile. On the third day some of the eggs may already be fertile if the hens are in full laying. After the males are separated the eggs will commence to show a decrease in fertility, covering a period of 14 to 20 days and even then an old egg might still be fertile. But generally after the fourteenth day eggs may be guaranteed non-fertile if sold for market use. The practice of using alternate males has a tendency to produce higher fertility in the eggs. Using one male a day or two and then changing off to the other one is a common practice. It is, however, hardly practical for the farmer to follow this as it requires considerable labor at a busy season of the year.—M. C. Herner, Professor of Poultry Husbandry, Manitoba Agricultural College, in the Grain Growers' Guide.

Brantford Gasoline Engines

We manufacture the most complete line of Engines on the market. Our new Catalogue has just been issued and is Free to interested enquirers.



A Brantford Engine is the best that money can buy.

We manuracture complete lines of

Wind Mills, Grain Grinders, Steel Pole and Wood Saw Frames, Pumps, Tanks, Water Boxes, Concrete Mixers, etc.

A. McCAUSLAND, Victoria Hotel, St. John, N. B., Maritime Representative.

It has often been said that there is more money in the keeping of hens on an ordinary farm than many other branch of agriculture. Mr. Percy LeLacheur of Murray Harbour last week kept 65 hens, about 26 of which were Plymouth Rock hens, the rest a mixture of Leghorns and Minorcas. During the year 1915 he sold eggs to the value fo $114.49, also 40 cockerels, for which he received $46.72, 20 hens, for which he received $5.67. Canned 13 hens for use the coming summer and has now 67 hens, all Plymouth Rocks, the oldest of them 1½ years. Besides this he had the eggs used by the family and also the hens which were killed and eaten. This makes a cash revenue from 65 hens of $166.85 in the year. Who can beat this?—The Examiner, Charlottetown.

Reports of County Farmers' Association Delegates at the Recent Nova Scotia Farmers Association.

Report of the Annapolis County Farmers Association:
Mr. President:

The membership of this asociation for the past year is 102, much less than formerly.

We have not had as many institute meetings as usual owing to the difficulty in securing lecturers. Mr. L. D. Robinson and G. E. Sanders, Entomologist, being the principal speakers at our annual meeting. We were favored with an address by W. Saxeby Blair, Experiment Farm, Kentville, and G. E. Sanders.

A number of our members entered the field crop competition in wheat and oats. One of the competitors scored 96 points in wheat.

The hay crop was exceptionally large with an abundance of clover. Grain was fairly good. Potatoes were light; turnips were not as large as usual.

Increased interest is shown in the dairy industry, with larger production. The creamery at Lawrencetown has had a successful year. The list of patrons is increasing.

Our crop of fruit for the last year was very disappointing, both as to quantity and quality. Yet many of the orchardists had good results, due to intelligent and persistent spraying.

The executive and others of our Association have spent much time, energy and some means to forward the erection of an agricultural demonstration building at Lawrencetown. We have to thank Principal Cumming, Secretary for Agriculture, for the readiness with which he has given his time and the means at his disposal. Also our thanks are due to the Federal and Local Governments, the Municipal Council and gifts of individuals toward this undertaking.

We anticipate that on the eighth of February, Principal Cumming, Secretary of Agriculture, at a grand opening, will declare this building opened for agricultural purposes.

The following days of the week will be taken up with short course work. We will thus be entering a new phase of farmers' education in the county, which opportunity, we hope, will be taken advantage of by very many.

L. W. ELLIOTT,
Secy. A. C. F. A.

Report of Kings County Farmers' Association

This Association sends two delegates to your Association this year, Mr. P. L. Morse of Berwick, and George Hutchinson, of Morristown. Our membership the past year was 50. We held nine meetings in the county, seven of which were addressed by L. D. Robinson, the other two by W. H. Woodworth and W. Saxby Blair. Total attendance 214. These meetings were held in February and the weather was very bad. A picnic was held at the Agricultural College in June. Quite a large number attended. The balance on hand at the anual meeting was $24.78.

Fox farming and Western land speculation does not seem to engage the attention of our farmers as much as in past years. Mixed farming is very popular at present, and the day may come when apple growing in the Annapolis Valley will be a matter of history.

Respectfully submitted,
W. H. WOODWORTH,
Secretary.

Yarmouth County Report

In behalf of the Yarmouth County Farmers' Association, I beg leave to report:

The Association held twelve regular monthly meetings during the year and the attendance was large and enthusiastic. Different subjects were discussed at each meeting, bringing under consideration matters of importance to farmers, such as manures and fertilizers, and their most economic use, dairying and the development of the creamery enterprise, potato culture and spraying, grain crops including a more extended use and cultivation of winter grains, rye and wheat, and so on with other matters of prime importance.

Our plan is to have a committee map out a program or subject for each month at the beginning of the year appointing a leader for each meeting. After routine of business, the leader introduces the subject which is then thrown open for general discussion and usually elicits warmth.

This stimulates interest in our membership so that we have a large annual membership, nearly 300, a long roll of five year members, who come in at a slightly reduced rate and a noble and worthy list of life members.

While the Agricultural Society is mainly devoted to sustaining our great Annual Exhibition, the Farmers' Association is the place where we meet monthly in our Farmers' Parliament and discuss subjects of mutual interest, and exchange experiences. We find this the quickest and most profitable means of promoting our agriculture.

Twelve special meetings were held during the year at distant places in the county, where the inhabitants find it impractical to attend the monthly meetings owing to distance. These meetings held in country school houses, farm houses and village halls were largely attended by interested gatherings, whose business—fishing by the shore, and lumbering inland—had for so many years drawn attention away from the farm, that many of the simplest methods and most approved methods of agricultural procedure were almost forgotten. Much good work is done by this means.

Our general object is to promote practical agriculture by the shortest and most direct methods that come to hand.

Our Association imported two car loads of all kinds of seeds for the members at greatly reduced prices. These seeds of course, were ordered in advance by the members through the Secretary.

The Associ tion held a seed fair for the display of the produce of our local seedraising industry. It is said that Yarmouth has a unique climate, admirably adapted to the production of farm seeds. Our Corning Turnip Seed enterprise is assuming large proportions and the output is largely exported to other localities. Some exhibits at Provincial and Dominion shows have a government test record and certificate of 98 and 99% purity and germinating power.

The short course held under the auspices of the Farmers' Association in the Exhibition Building of the Agricultural Society, has been a great success. The attendance from every section of the county has been two hundred and upwards. The talks on seed selection, fertilizers and cattle judging have been most instructive and much appreciated by many of our young men who cannot find the time or means to go to Truro.

We were visited at one of our meetings by Principal Cumming, whose business talk on creamery methods and soil improvement was most illuminating.

Our creamery output last year totalled forty to fifty thousand dollars.

But the great social event of the year in Yarmouth is the great annual picnic of the Farmers' Association.

The picnic was held this summer about the last of August at Lakeside Park and was attended by upwards of five thousand persons from all sections of the county mingled amongst whom were a large proportion of the population of the enterprising town of Yarmouth. The best of humor prevailed and the sports were carried out with great spirit.. The picnic is exceedingly popular as a fixed institution and is the ocacsion when everyone goes to meet and see everyone else. Old acquaintances are renewed and new friendships formed. The picnic together with the general social spirit which our Association makes it one of its prime objects to foster renders the existence of the Association indispensable to the welfare of Yarmuoth County.

We are not going back in Yarmouth County, we are co-operating to accomplish results.

GORDON T. LEWIS.

THREE VITAL QUESTIONS
Are you full of energy, vital force, and general good health? Do you know that good digestion is the foundation of good health; Pains and oppression in stomach and chest after eating, with constipation, headache dizziness, are sure signs of Indigestion. Mother Seigel's Syrup, the great herbal remedy and tonic, will cure you.

AFTER MEALS TAKE MOTHER SEIGEL'S SYRUP. AND BANISH STOMACH TROUBLES

No. 11 Wheel Plow
No. 19C Wheel Cultivator

Practical Gardening Tools

TOOLS like these will do all of the necessary work (except plowing and harrowing) economically, whether for home, farm or market gardens. You can plant certain crops close and straight, and work them close and safely, with wheel hoes. You save ground, save heavy investment for tools at the start and yet do the best kind of work with profitable results.

IRON AGE Hand Seed Drills and Wheel Hoes

Will sow, cultivate, ridge, furrow, etc. better than you can with any old fashioned tools and ten times quicker. Pushed ahead a step at a time, these tools can be worked by women, or grown boys or girls. We show here a few only but we make 38 styles and combinations from which to choose. Prices, $3.00 to $14.50. There are also many attachments for special work

Ask your dealer to show them and write us for booklet "Gardening With Modern Tools." Also, for horse hoes, harrows and cultivators, sprayers, etc.

The Best Treatment For Constipation.

The Experience of One Who Knows and Places Dr. Chase's Kidney-Liver Pills First.

It is not difficult to secure a medicine that will effect movement of the bowels. To cure Constipation and the complications which arise from it is another matter.

Constipation of the bowels is usually preceded by torpid action of the liver. Hence it follows that if Constipation is to be cured the liver must be set right. And here lies the secret of the success of Dr. Chase's Kidney-Liver Pills. They awaken the action of the liver and insure a good flow of bile, which is nature's cathartic. The liver, kidneys and bowels are invigorated and regulated, and the troubles with the digestive system disappear.

Mr. H. M. Bell, Innisfail, Alta., writes: "For some considerable time I have been using Dr. Chase's Kidney-Liver Pills, which I have obtained through your firm. I suppose during my life I have used nearly all the best-known pills, as I have been subject to Constipation and digestive troubles. A friend recommended Dr. Chase's Kidney-Liver Pills, and I can honestly say that of all the pills I have tried nothing has suited me better—no griping—action always insured, and fine for the kidneys. This is how I have found them after a thorough test and you may use this statement if you like."

This letter should convince you of the merits of Dr. Chase's Kidney-Liver Pills, but there is nothing like personal experience. If you do not feel like risking 25 cents for a box, write to us for a free sample box, mentioning where you saw this advertisement. Put this medicine to the test when you have indigestion, constipation, biliousness, backache or kidney derangement. The results will soon prove to you the superiority of Dr. Chase's Kidney-Liver Pills. One pill a dose, 25 cents a box; all dealers, or Edmanson, Bates & Co., Limited, Toronto.

Five Good Reasons

Whether you have no Separator at all or are using an old, partly worn out machine, there are five good reasons why you should buy a "STANDARD."

1st---SKIMMING

Repeated tests by leading Dairy Authorities in Canada and elsewhere, have proved beyond question that the "STANDARD" skims cleaner, under all conditions, than any other Cream Separator.

Prof. H. H. Dean of the Otnario Agricultural College, Guelph, says: "Our Inspector, Mr. Smith, makes the following report on the test made with our Separator, in which 150 lbs. of whey, containing .29% fat, was skimmed in 21 minutes. The whey cream tested 50% fat, the skimmed whey .01% fat. This we consider a very satisfactory test.

Prof. R. M. Washburn, of the University of Minnesota, St. Paul, U.S.A., reports the following results:

From 65 lbs. of milk containing 4.6% fat, separated at a temperature of 90° Fahr. Percentage of fat in cream, 30%. Percentage of fat in skim milk, .01%.

2nd---CAPACITY

Every "STANDARD" Separator skims over its rated capacity.

A test made at the Eastern Dairy School at Kingston, with a Size 4 "STANDARD" listed capacity 450 lbs. per hour, gives the following results, with milk separated at 90° Fahr.

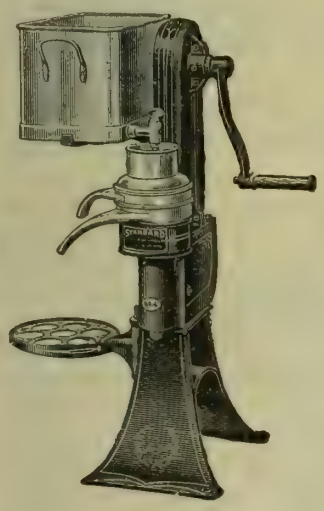
Pounds of milk separated	200
Time taken for separating	23 min.
Percentage of fat in cream	27.5%
Percentage of fat in skim milk	.02½%

This shows that, although **rated at 450 lbs. per hour,** the machine actually **skimmed at the rate of over 520 lbs. per hour,** and still skimmed closer than most other separators do while skimming at their rated capacity or less.

3rd.---CAPACITY CHANGE

The capacity of a "STANDARD" Separator can be increased at any time by a simple change of parts at a low cost. The "STANDARD" need never be too small.

For instance: One of our customers, early in 1915, bought a Size 2 "STANDARD" capacity 350 lbs. per hour. This year he had nearly twice as many cows milking, and needed a larger machine. We increased the capacity of his "STANDARD" to over 600 lbs. per hour by giving him a new Size 6 bowl, etc., for the difference in price and an insignificant charge for depreciation on the old parts turned in.



An important point in connection with our Capacity, Change is that we supply a new bowl complete, of the larger capacity required. It is not a make-shift change of skimmers.

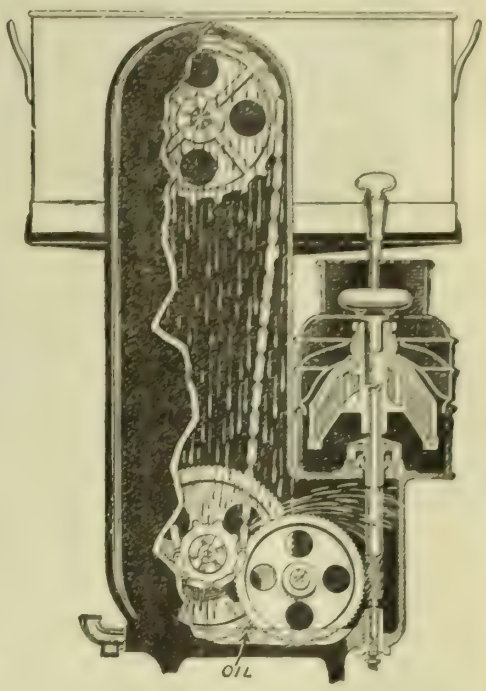
4th--DURABILITY AND OILING

We use the best quality of Phosphor Bronze in our spindle bearings and worm gear.

Our shafts are made from the finest Drillrod Steel.

The main gear is of the new style helical type, and worm sleeve on the bowl spindle is interchangeable.

All the running parts of the "STANDARD" Cream Separator are contained in an oil-tight, dust-proof casing, and run in an oil bath. On account of the "STANDARD'S" unique, self-oiling system, there is no wear on the running parts, and "STANDARD" Separators are good for years of hard work. The "STANDARD" is the only real self-oiling cream separator.



Standard

5th--SERVICE

The "STANDARD" is in every respect a Canadian machine, built right here at Renfrew, Ont., by ourselves, and we will stand up to our guarantee, and protect you and every user of our machines. Think what this means to you, if you need spare parts, or expert assistance at any time in a hurry. You cannot expect manufacturers outside of Canada to give you service equal to ours in speed or completeness.

The sectional cut of the "STANDARD" shown above, will give you an idea how it is built, but we want to show you a machine in actual operation in your own dairy, and will be glad to do so without any cost or obligation on your part.

Just write and tell us that you would like to see the "STANDARD" at work. We will do the rest.

Our latest Cream Separator book is free on request.

THE CONVENTION OF THE

Farmers', Dairymen's and Provincial Seed Fair Association

WILL BE HELD IN

Fredericton, February 28th to March 2nd, inclusive

Thursday, March 2nd, will be Live Stock Day and will be spent at the Experimental Farm. The work of the day will be under the direction of Prof. Barton of Macdonald College.

Delegates attending the Convention will ask for Standard Certificates over I. C. R. and C. P. R.

STRAWBERRY PLANTS!

One Grower in New Brunswick sold $5000.00 worth of Strawberries from a ten acre field last season. Another received $3000.00 from six acres in berries. The costs were about one hundred dollars an acre to picking time; figure the profit for yourself. These men bought 150,000 Senator Dunlaps from us last spring. This shows what the most successful berry growers think of the Senator Dunlap, the little Giant of the Strawberry world. We can supply plants for the professional Strawberry grower, for the man who grows an acre or two as a side line to general farming, or for the family garden. Good strong well rooted plants are more than half the battle in successful Strawberry culture. Start right. Don't take plants from an old bed, or from the side of the rows as a gift. All farmers know that poor seed means a poor crop.

Our Senator Dunlaps, $3.50 a thousand. We make a discount on large orders. Other varieties, Sample, Valeria, Arnout, William, etc.

AN EVEN SCORE.

(By Leigh Gordon Giltner)

"I can't see," proclaimed Travis in the maddeningly superior tone his wife found so trying, "I really cannot see, Edith, why you and your sex as a whole are such abject slaves to the dictates of fashion. You're like sheep—one leads and the rest follow, without the slightest reference to the fitness of things. If you could only be brought to realize how infinitely more attractive you'd be if you'd cultivate individuality in costume and coiffure instead of lavishly following the prevailing mode. But if a thing has a vogue you adopt it, regardless of any question of suitability or becomingness. Because dainty little Mrs. Graves looks svelte and graceful in a sheath skirt, old Mrs. Van Leer, who weighs two hundred if she weighs a pound and resembles a dirigible in motion, orders it duplicated—the skirt, not the effect, I mean—"

"Then you think, Tom, a woman should be a law unto herself in matters of dress?"

"Decidedly. She should either ignore the fashions altogether or adapt them to the expression of her personality. She should determine what best suits her particular style and proceed to wear it regardless. She should eschew all cosmetics and not go about looking like a pierrot—or a marshmallow. She should decide upon a bcoming coiffure—and stick to it, despite fashion's fluctuations. A year ago the average woman was wearing enough false curls, puffs, braids and rats to stuff a sofa-pillow; when suddenly, because some foreign actress or dancer took to dragging her hair down in wisps over her ears and confining it with a string of colored beads—a bandeau I believe you call it—one and all followed suit, regardless of contours or consequences—result, in the average instance—a cross between a snake-charmer and an Indian squaw. Ours may be a free and enlightened country, but you women are slaves every one of you to the whims of a coterie of Parisian man-milliners who aid you to make spectacles of yourselves. And you meekly accept their decrees—whether it is a matter of hoop-skirts or of no skirts at all. Now our sex—"

Edith could not forbear a significant and slightly sardonic glance at her husband's immaculate costume. His trousers were correctly creased, his gray Ascot properly tied, and every detail and accessory perfect in its fitness.

"A man," Travis made direct answer to the unspoken suggestion, "—Edith, this cream's a bit sour. It has quite spoiled the cereal. You may take it away, Ellen—. A man, as I was saying, goes to a reliable tailor, orders a suit of the best material in stock—and wears it till it's threadbare, regardless of trifling changes in the popular cut and color; while a woman will discard a perfectly good gown, simply because a 'Paris fashion hint' convinces her that the sleeves are too full or the skirt a trifle wide. Take this suit I'm wearing."—with a glance of pardonable pride at the natty rough gray mixture in which his well-knit figure was clad—"I paid Matthews seventy-five for it two seasons ago and it's quite presentable still. The evening suit I ordered for our wedding four years since has done duty ever since. I shall wear it quite contentedly this evening while you'll doubtless fret because you haven't a new gown for the occasion."

"This evening?" Edith echoed.

"Yes. I quite forgot to mention that Trescott of our Montreal branch and his wife are at the Queen's for a day or two en route to Winnipeg. Trescott's influence means a lot to me—he's the coming vice-president of the concern without doubt—and he's a very decent chap besides. I felt I'd like to do something for their pleasure, so I ordered a box for Forbes-Robertson in his new play this evening. I thought you could come in on the interurban; we'd all dine together and afterwards go to the show. What do you say?"

"Why, it will be lovely," she responded eagerly. "But—er—is Mrs. Trescott very imposing in appearance, Tom?"

"Mrs. Trescott is an unusually beautiful woman; but aside from that she has the fortunate faculty of always being correctly costumed for any and every occasion. Why do you ask?"

"Why, you see," faltered Edith rather shamefacedly, "the fact is I'm afraid I haven't anything very new or very suitable—"

"New, see here, Edith," Tom interposed impatiently, pushing his plate aside. "I make you an ample allowance and there's no reason in the world why you shouldn't have sufficient and suitable gowns for all occasions. I am anxious to impress the Trescott's favorably for business as well as social reasons, and I shall expect your appearance to do me credit. Shall I meet you at the car-station? Or since its' only a block and I'll have to dress, can't you join us in the leather-room on the third floor? It's more private than the parlors. Perhaps, you'd best make your toilette at home if you take the seven o'clock car, so as to avoid delay. We'll spend the night at the Wyndham, of course. I shall expect you to look your best. You have, or should have, plenty of clothes and there's no reason why you should not make a creditable appearance."

He caught up his hat and coat and with a hurried goodbye was off to make the eight o'clock interurban into the city of which Crestwood was a suburb. Left alone in the empty breakfast room, Edith did some rapid thinking and made certain deductions not wholly flattering to her spouse. Tom was one of the men who incline to the "Sir Oracle" attitude—and it was growing upon him. He had very decided views on all subjects which he did not hesitate to express. He was exceedingly liberal with unsolicited advice, suggestion and criticism; he would have cheerfully corrected Caruso's method of tone-production and pointed out to Paderewski the true interpretation of one of his own compositions. He criticized his wife mercilessly, her costumes, conversation, the conduct of her household in its various detail, from the management of her maids to the brand of breakfast cocoa she favored. He corrected her simplest statements and aspersed her tastes and interests; he scouted her feats at golf and she was forced to defend her soundest play at cards. But it was what he termed her "slavish subjection to style" which especially excited his critisism and contempt—though no man alive had less fondness for a frump than he. Edith was a patient woman but patience has its limits.

"I'll do it!" she said at last as she rang for the maid to clear away the remains of the dainty breakfast, "it's pretty radical and it will take courage, but Tom needs the lesson."

"I'm most anxious to meet Mrs. Travis," pretty Mrs. Trescott, whose perfections Tom had not exaggerated, was saying graciously as she, her husband and Travis foregathered in the attractive leather room at the Queen's Hotel, pending Edith's arrival, "I've heard such pleasant things of her."

"Yes," corroborated her husband heartily, "our Mrs. Stacy whom you entertained when he was here last spring was enthusiastic in his praise of her. He said, I believe, that she was the cleverest and most stunning woman he met while west."

"Well," Travis conceded with the easy pride of possession, "That's putting it rather strong, but Edith really isn't half bad looking; she has abundant tact and dresses in admirable taste and, on the whole, I'm rather proud of her."

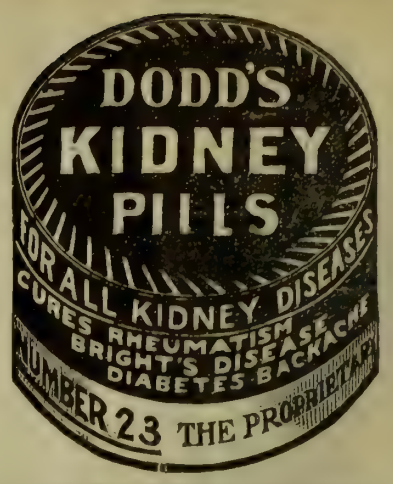
Even as he spoke a figure appeared in the doorway, pausing uncertainly on the threshold—a figure so alluring to the casual eye, that, taking in the general effect of her appearance, Travis did not, for the moment, glance at her face.

"Looks as if she'd stepped out of 'Godey's Lady Book'," he commented inwardly as the archaic character of the newcomer's costume communicated itself. Then he lifted his eyes to the face above—and gasped.

"Edith!" he hardly realized that he had spoken.

"I trust I'm not late,"—the voice was certainly Edith's—"Something went wrong with the—the circuit—I think they said, and we got in fifteen minutes behind time. Tom, present me to Mrs. Trescott." How he got through with the ordeal and subsequent amenities, Travis never knew. His eyes dwelt with a horrible fascination upon the Edith he was proclaiming his wife. The Edith, admirably costumed to the minutest detail, of whom he was secretly proud, was not in evidence. In her stead was a typical village matron in gala attire. She was wearing a foulard of glaringly hideous design and antiquated cut (the pattern had been given to Edith before her marriage by an erratic aunt of notably poor taste and Edith had had it made up, to avoid wounding Aunt Evelyn, in whose honor she occasionally wore it.) The skirt was voluminously, full (Mrs. Trescott's charming gown fitted her like a glove); the sleeves were long and bouffant when they should have been short and scant; the high collar was hideously unbecoming; (Edith had not worn a high collar in years). Her face was guiltless of any trace of make-up and on her pompadoured and ratted hair was perched a hat of the vintage of two years previous which Edith had unearthed from a box in the attic. She feared she had rather overdone it but in reality the effect was quite convincingly that of the woman absorbed in other things to the exclusion of the modes.

The dinner in the cafe, softly lighted with rose-shaded candles and hooded electrics, and fragrant with hot-house roses, was a perfect nightmare to Travis. It seemed to him that every notable man and woman of his acquaintance either passed into or out of the cafe while the service was in progress and that at least half of these paused beside his table long enough to be presented to his wife. The contrast between Edith and Maud Trescott was painful. The breeding of the Trescotts was too perfect to admit of any slightest sign of amazement by so much as the quiver of an eyelast, but Travis, who despite his diatrites against fashion, was her very loyal devotee, suffered in complete comprehension of what their emotions must be. He had, for the once, quite forgotten his diatrite of the morning and was at a loss to account for Edith's vagary; but suddenly it flashed upon him and with it a ray of hope. Surely



A WOMAN'S MESSAGE TO WOMEN.

If you are troubled with weak, tired feelings, headache, backache, bearing down sensations bladder weakness, constipation, catarrhal conditions, pain in the sides regularly or irregularly, bloating or unnatural enlargements, sense of falling or misplacement of internal organs, nervousness, desire to cry, palpation, hot flashes, dark rings under the eyes, or a loss of interest in life, I invite you to write and ask for my simple method of home treatment, with ten days' trial entirely free and postpaid, also references to Canadian ladies who gladly tell how they have regained health, strength, and happiness by this method. Write today. Address: Mrs. M. Summers, Box 309, Windsor, Ont.

WOMAN HAD NERVOUS TROUBLE

Lydia E. Pinkham's Vegetable Compound Helped Her.

West Danby, N. Y.—"I have had nervous trouble all my life until I took Lydia E. Pinkham's Vegetable Compound for nerves and for female troubles and it straightened me out in good shape. I work nearly all the time, as we live on a farm and I have four girls. I do all my sewing and other work with their help, so it shows that I stand it real well. I took the Compound when my ten year old daughter came and it helped me a lot. I have also had my oldest girl take it and it did her lots of good. I keep it in the house all the time and recommend it."—Mrs. DEWITT SINCEBAUGH, West Danby, N. Y.

Sleeplessness, nervousness, irritability, backache, headaches, dragging sensations, all point to female derangements which may be overcome by Lydia E. Pinkham's Vegetable Compound.

This famous remedy, the medicinal ingredients of which are derived from native roots and herbs, has for forty years proved to be a most valuable tonic and invigorator of the female organism. Women everywhere bear willing testimony to the wonderful virtue of Lydia E. Pinkham's Vegetable Compound.

after subjecting him to such an ordeal she would feel his punishment sufficient, and after dinner rush up to her room, doff her disguise and appear in propria persona. But alas! to his tentative:

"There's still ample time if you wish to change your dress, Edith," and Mrs. Trescott's pleasant supplement:

"May I be of service? I's a very capable maid, I assure you," she returned a cheerful:

"No, thank you, I'll just remove my hat and fluff my hair a bit. I dressed for the evening before I left home."

Again, in the brilliantly lighted theatre, Travis lived and moved as in a nightmare. Edith's hair, decidedly "fluffed," was a sight—a towering mass of archaic puffs and curls, ornamented with an antiquated aigrette that had been her mother's; her dainty peachy-tinted complexion, lacking the touch of violet talcum with which she usually dusted it, had an unlovely shine; her mnaner (such is the moral support of proper costuming) was less easily graceful and gracious than its wont. Mrs. Trescott's dazzling beauty inevitably attracted attention; and as inevitably, her sober-suited companion came in for unflattering notice and comment. It seemed to Travis that their box was a target for a perfect battery of lorgnettes. He usually delighted in Forbes-Robertson, but this evening he sat stupidly and stolidly through the three acts, wondering if he should attempt to explain to the Trescotts, if they'd fancy him a lunatic or a cad. It was over at last—but woe upon woe. Edith vivaciously suggested supper in the Queen's "Blue Room"—where poor Travis encount red all those of his urban acquaintance he had previously missed. He was sick with humiliation and disgust.

"Edith," he began sharply, when they were at last alone, "may I ask why, when you know how much their interest means to me, you have chosen to humiliate me in the presence of the Trescotts?"

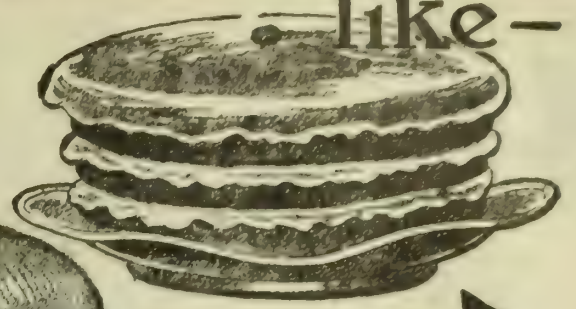
"Tom," she responded pleasantly, "Do you recall the occasion of a large reception when you took my new sheath gown (the first that appeared in Creshwood) as a text, held me up to public scorn and made me the laughing stock of the evening? And do you chance to recall some of any of the things you said this morning? I'm merely cultivating individuality and making my dress express my personality as you suggested."

She smiled sweetly into his eyes as she drew out the pins which held in place that remarkable coiffure. He was "hoist with his own petard"—and knew it. Being not wholly unwise he dropped the discussion.

Trescott suggested a business interview in the reading room at seven-thirty next morning, after which the party of the previous evening would breakfast together. Travis, still too entirely obsessed with Edith's new departure to be quite himself, hardly realized that Trescott was hinting at a possible early promotion for which Travis had hoped for two years. He was still in a species of daze when he sought the cafe where they were to meet the ladies, but he came out of his trance with a sudden start and a wild rush of relief and delight. Edith was coming toward them down the long corridor with Mrs. Trescott and there was little choice between them in the matter of perfect gowning and grooming. Edith was wearing the most distinguished of her many attractive stret gowns; in every particular to the minutest detail, she was absolutely and flawlessly correct. Travis thought happily that he had never seen her so beautiful; Mrs. Trescotts' eyes approved her and Trescott paid her the tribute of more than one admiring glance.

"Well, Edith, you win!" Travis conceded good-naturedly, as half an hour later, he walked with her toward the car station, after a cordial parting with the Trescott's, who had promised to motor out to dine with them as they returned east from Winnipeg. "I suppose I got what was coming to me, but you certainly did rub it in. You'll never guess how I suffered. I hadn't the faintest idea you'd taken the Trescotts into your confidence while I was at the telephone last night and I was sure that early English get-up of yours would queer us eternally with them. But Trescott told me just now that his opinion of you coincided with Stacy's and added thta they hoped to see more of us when I'm promoted and sent east. So, if when they come to Crestwood you give them one of your famous little dinners and look your prettiest—I say Edith,"—breaking off abruptly as a sudden idea occurred to him—"since you're in town why not go around to Madame Laroque's and order a new gown for the ocacsion? I think it's my treat."

A Blended Flour —like—



BEAVER FLOUR

Is The Only One That Is Equally Good For Bread and Pastry

EVERY good Canadian housewife remembers the kind of Bread she got with western wheat flour — the tough, coarse loaf, uninviting, rather tasteless and full of holes.

She knows that such flour cannot make good pastry, no matter how much water she uses in the dough.

"Beaver" Flour is a blended flour—made of the famous Ontario pastry wheat, with the proper proportions of Manitoba wheat added to increase the strength.

"Beaver" Flour makes a good size loaf of bread—sweet, tasty, appetizing—as white and light as snow—with crisp, brown crusts—a truly delicious, nourishing food, that everyone enjoys for every meal.

It makes the kind of Pies and Cakes that you are proud to serve and everyone is glad to eat. Tell your grocer you want to try "Beaver" Flour—the original blended flour. 160

Successful Course in Household Science and Handicraft Now Going on in Sussex.

The Women's Institute Division of the Departmetn of Agriculture is successfully conducting a course in Household Science and Arts and Crafts in the new Agricultural School at Sussex.

The classes conducted daily are as follows:

9-10 a.m.—Basketry and Leather Tooling.
10-10.30 a.m.—Lectures on Composition and Nutritive Value of Foods.
10.30-12.30 a.m.—Practical Cooking, when each student has an oportunity to prepare one or more dishes.
2-3 p.m.—Personal Hygiene and Home Care of the Sick.
3-4 p.m.—Stenciling and Wood Carving.
4-5 p.m.—Needlework and Knitting.

The first course, completed last Friday afternoon, was very encouraging to the department, and of lasting benefit to the many ambitious students present. Possibly the attendance is larger at the Handicrafts classes, owing to this work being newly introduced in the Women's Institute annual short courses. The public was invited to inspect the accomplishments of ten days' work in this popular class, and the students had every reason to feel proud of the many pretty baskets made of reeds and raffia in various shapes. Several pieces of leather work include, magazine and book covers, card cases, change purses, centrepieces, all of various designs and colors. One has only to look a few months hence to see the women reaping the advantage of this useful work, engaged in making pretty and useful articles to adorn the home, to give to their friends at Christmas time, and lastly to adopt as a further means to raise money within the home.

The department has equipped a Household Science room in the school at Sussex sufficiently for forty students to enter the cooking classes. Thirty minutes are devoted each morning to talks on proper combinations and preparations of foods, the best cooking methods and the nutriment contained in various foods. Pupils are at leisure to ask questions and the most beneficial parts of the lectures are jotted down in the notebooks near at hand. Then follows the practical work, and it is a pleasing sight to see young, middle aged and elderly women, in their white aprons, busily engaged in preparing some savory and nutritious dish, which inevitably turns out a grand success, and you may be sure will be "tried again" at home, as each pupil receives a copy of all the recipes used during the entire course.

Owing to the many compliments coming their way, the students of the cooking class invited the pupils of the other classes and the members of the

Worms Make Children Peevish

Some symptoms of worms are: Deranged stomach, swollen upper lip, sour tongue, offensive breath, hard and full belly, with occasional gripings and pains about the navel, pale face of leaden tint, eyes heavy and dull, twitching eyelids, itching of the nose, itching of the rectum, short, dry cough, grinding of the teeth, little red points sticking out on tongue, starting during sleep, slow fever. If you have the least suspicion that your child is troubled with stomach worms or pinworms, don't hesitate—get a bottle of Dr. True's Elixir. This remedy has been on the market over 60 years. Put your child on the way to good health by using Dr. True's Elixir, the Family Laxative and Worm Expelled. Good for adults also. At dealers', 35c, 50c and $1. Advice free.

Trade Mark

Knowlton, Que. Dr. True

Sussex Women's Institute, which by the way has a paid membership of sixty-four to Five O'Clock Tea the first Saturday of the opening course. Garbed in their best regalia, the students served daintily prepared refreshments to their many guests. Altogether it was a pretty sight to see the tables, decorated with pink and white carnations, and the students serving, in accompaniment to the strains of music ably rendered by the Sussex Ladies' Orchestra.

Prizes are given in each class and it was both amusing and interesting to see with what effort the pupils of the Home Nursing and Sewing Classes tried to obtain full notes and to do their work to the satisfaction of the teacher. Each student has to properly make a bed for a patient, change the bed linen, and by demonstration show how to bathe, dress and turn a helpless sick person. And this is only a "wee sma" note" on the helpfulness of the many lectures on Home Nursing.

Several useful and pretty articles were sewn "by hand" at the Sewing clases, and although we would not do away with the sewing machine, there was close competition between Mr. Machine and Miss Student as to neatness of the finished article. Also, the knitting needles may have worked slowly and several stitches may have been dropped in work by beginners in the Knitting class, yet before the first course colsed, needles worked much faster and the teacher was led to believe that there were some Women's Institutes in New Brunswick whose yield in the knitting line would be greater than ever before the dawn of spring.

It would never do to conclude these remarks about this beneficial course which is available to every woman and girl in the province, without mentioning the prize-winners in the various classes and the successful event held the closing evening of the first course.

The Department of Agriculture has made it possible for a student to win as much as $20.00 at each course, and we announce with much pelasure the winners for the first course.

Five dollars to Mrs. Frank Daughney, of Dalhousie Junction, for best work in Handicraft; $5.00 to Miss Ethel Davis, of Sussex, for highest mark in written examination on "Theory in Cooking"; $5.00 to Mrs. William Howard, of Sussex, for neatest work in sewing contest; and $5.00 to Miss Elizabeth Howard, of Sussex, for highest mark received in written examination on Home Nursing.

With the aid of the students, the members of the Sussex Women's Institute brought to a close the first course by means of a Patriotic Concert, last Friday evening. The Assembly Hall of the Agricultural School was literally packed and much pleasure was derived from the vocal and instrumental solos, readings and selections from the Sussex Ladies' Orchestra. Honorable James A. Murray, Minister of Agriculture, acted as chairman and congratulated this branch for having raised during the past year something over twelve hundred dollars for patriotic purposes. It meant some difficulty in serving refreshments to so many people asembled, but before the time arrived for "God Save the King" each person was served to a cup of coffee, a sandwich and a piece of cake. On the whole, the women of the Institute are to be congratulated for having cleared over Fifty-five dollars from twenty-cent admissions, this money to further assist in the noble work being done by this energetic branch.

February 25th completes the courses at Sussex, and indications are brighter

Seeds with a Pedigree mean Money-making Crops

THE first step to intensive farming is to use only *tested seeds* of the best quality, and of varieties especially bred for Canadian climatic conditions. No amount of care in cultivation will produce big yields from inferior seeds. *It is now forty years since*

McDonald's TESTED SEEDS TRUE-VIGOROUS-RELIABLE

were first supplied to Canadian farmers and gardeners. For nearly half a century, season after season, they have been producing money-making crops for those who use them. They have an honest reputation for strong, vigorous germination, and for producing hardy, healthy plants. McDONALD'S Tested Seeds are of strong, pedigreed strains, especially selected for Canadian climatic conditions, and are subjected to rigid tests before being approved for sale.

Get bigger yields per acre by using McDONALD'S Tested Seeds

Hundreds of varieties of field, garden and flower seeds illustrated and described in McDONALD'S Seed Annual. 100 pages, full of valuable information for the farmer or gardner. Write now for your copy, it is free.

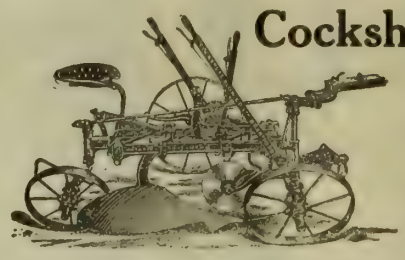
KENNETH McDONALD & SONS, Limited

46 Market Square (2) OTTAWA

Take Advantage of Frost & Wood Service

Every Frost & Wood dealer is trained to give you the best possible advice on what implements to buy, when to use them, how to use them. Much of our success has been due to the intelligent advice our agents give to our customers. Look up the Frost & Wood agent in your neighborhood. He is a good man to know.

Cockshutt Footlift Sulky



Here's a Plow that a boy can do a man's work with, it's so easy to use. A slight pressure on the foot lever brings the mould board out of the furrow or sets it to work again. Or you can set it to rise automatically if working in rough ground. It's a pleasure to use the Footlift Sulky—it gives uniform plowing in any kind of soil, meaning uniform growth and ripening of crops. Fitted with either wide or narrow bottoms, and either Knife Colter, Rolling Colter or Jointer, as desired.

Beaver Gang Plow

Three horses and a half-grown boy can do more and better plowing with this light-draft Gang than two good men with four horses and two walking plows. There's your chance to make money! The levers are very easy to operate, and they give absolute control of your plow and its work on up-and-down or stubborn ground. A perfect giant for strength. Supplied in various bottoms, also with Knife or Rolling Colter or Jointer as desired. Learn more about this splendid implement.

The big, complete Frost & Wood line of "quality implements" is ready to help any farmer make more money, get better crops and with less labor.

Binders,	**Cultivators,**	**Mowers and Rakes,**

A COLD
Settled On Her Lungs
Causing Great Pain.

THE CURE WAS

DR. WOOD'S
Norway Pine Syrup.

Miss D. M. Pickering, St. Catharines, Ont., writes: "Having derived great benefit from Dr. Wood's Norway Pine Syrup, I thought I would write and tell you of my experience. When I first came out from England I contracted a severe cold, owing to the change of climate. It settled on my lungs, and caused me a great deal of pain. I tried every remedy I could think of, but got no relief. My father, who had heard a great deal about the good qualities of Dr. Wood's Norway Pine Syrup, advised me to try it. I did so, and I am pleased to say, found immediate relief. I only took one bottle and it cured me completely. My mother had a severe cold also, and Dr. Wood's Norway Pine Syrup cured her, so we never fail to keep a bottle of it in the house."

See that none of those so-called "pine syrups" are handed out to you when you go to your druggist or dealer and ask for "Dr. Wood's." It is put up in a yellow wrapper; three pine trees the trade mark; price, 25c and 50c.

Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

for even larger classes at Woodstock. the first course beginning February 29th and closing March 10th, and the Agriculture to the women of the province, should result in an influx of applications from various points throughout the province.

HAZEL E. WINTER.
Supervisor.

Fruit Inspection in the Maritime Provinces.

Complying with your request I will endeavor to give the readers of the Maritime Farmer some little idea of the way fruit inspection under the Inspection and Sale Act, Part 9, is carried out in District No. 1 which comprises the Maritime Provinces of Canada.

Previous to 1913 the Inspection of exported fruit had been done at the shipping ports when it was being transferred from car to ship. This method was not satisfactory for the reason that when ships were loading there was a grand rush to get the cars unloaded as quickly as possible and the Inspector did what he could while the fruit was between the car and the ship's hold and if he found a barrel falsely marked, the chances were that all the other barrels belonging to the same lot weer by this time on board ship. And while the inspector has the right to hold shipments until he has completed his inspection he did not care to do so when the thermometer registered zero or below on the dock and there was danger of serious damage to fruit. During these years of inspection at the shipping port two inspectors were employed in the Annapolis Valley where the bulk of the fruit is grown. These inspectors travelled from place to place visiting fruit houses, giving instructions and incidentally notifying the inspectors at the docks when they had reason to believe that improperly packed fruit was being shipped, also from what place it was being shipped and the car number. This enables the men at the dock to more quickly discover poorly packed fruit. At present nearly all the inspection is done at the point of shipment, that is at the fruit house or orchard where the fruit is packed. Under our present system the fruit growing district is divided into sections. We have one hundred and ten large packing houses and each inspector is assigned a section embracing a number of these houses, and in the early part of the season he visits orchards where fruit is being packed.

These Inspectors are constantly on the move and visit all points in their section as often as possible. They inspect fruit anywhere they find it ready for market and forward their reports direct to the office of the Fruit Commissioner at Ottawa.

I may say that instruction is our strongest point. Inspectors act as instructors as well as detectives and we find that the percentage of growers who are dishonest when once they thoroughly understand how fruit should be packed, is very small.

The fact that fruit was never better or more honestly packed than it has been this year is a strong argument in favor of inspection at the point of shipment where instruction can be given to the men in the fruit packing houses.

For Hoarseness.

To cure hoarseness, beat up 2 fresh eggs, thicken them with sugar, add a little lemon juice or vinegar, and eat a little frequently; it will soon relieve. Another good remedy is to infuse a little finely scraped radish in a little water for 2 hours in a close vessel, and then add double its weight of sugar; take a tablespoonful at a dose and it will give speedy relief.

Dispersion Sale
March 15th

Owing to the Managing Director of this farm having gone to the front, it is found necessary to reduce our large stock.

On March 15th we will sell at Private Sale or Auction a number of Fine Holsteins and Ayrshires, all ages, male aud female.

Send for catalogue.

ROBERT KIDNEY, Manager.

GOODFELLOW, Chateauguay, Que.

McCormick

Oliver Plows

Try an Oliver Plow This Year

OLIVER plows for Eastern Canada are the result of the closest study of plowing conditions in Eastern Canadian fields. The point that interests you, of course, is whether or not you can get the plow that your conditions require. See the **McCormick** local agent and you will find that he has in stock or can get promptly, an **Oliver** that is exactly the plow for your work.

The **Oliver** plow line now includes walking plows, three-wheel sulkies, walking gangs, hillside plows, high and low-lift gangs. Among these, the **Oliver** 1-C sulky, 1-C gang and No. 26 sulky are prime favorites. In both of these plows most of the weight is carried on the two furrow wheels, which ride on a smooth surface all the time. This feature insures good plowing.

See the **McCormick** local agent or write to the nearest branch house, and we will see that you get full information about the **Oliver** plow that you can use to best advantage.

The Lightning Cure for
BRONCHIAL COUGHS

Veno's Lightning Cough Cure puts scientific precision into the treatment of bronchial troubles—cures as surely as water quenches fire. Veno's is not a mere hap-hazard mixture of a number of ingredients, thrown together in the hope that one or two may prove effective. Veno's is all effective, an absolute specific. That is why it is the most successful cough remedy in the whole world.

Awarded Grand Prix and Gold Medal, International Health Exhibition, Paris, 1910.

That medal was the hall mark of scientific approval—the highest award offered at the Exhibition. And Veno's Lightning Cough Cure won it as the purest, surest, speediest, and most thorough remedy of its class. Veno's is free from narcotics, free from poisons, and just as suitable for children as it is for grown up people. You can trust Veno's to cure—

Coughs and Colds
Bronchial Troubles
Nasal Catarrh
Hoarseness

Price **30** *cents.*

Difficult Breathing
Whooping Cough
Blood Spitting
Asthma

too patient! Feeling as old Omar the Tentmaker:

"Ah Love! Could thou and I with Fate conspire
To grasp this sorry scheme of things entire,
Would not we shatter it to bits—and then
Re-mould it nearer to the heart's desire!"

Which means that we must pray and work!

Boy's Competition in Swine Raising.

Rules and Regulations.

1. Open to boys of sixteen years and under, sons of farmers in each county in New Brunswick.

2. A boy on the farm may be the competitor, but only one in a family can enter the contest.

3. Each competitor must do all the practical work himself, but can receive advice and direction from parent or guardian.

4. Each boy entering the contest during the entire contest.
must attend, feed and care for the pig

5. Contest to begin at any time in the month of May and close when pig is five months old.

6. The breeds to be used in the contest must be pure-bred Yorkshire, Berkshire, Chester White or Tamworth, or grades from any of the named pure-bred males. Pigs must be bred upon the farm or purchased.

7. The Department of Agriculture offers three prizes to be competed for in each county and to be awarded for the largest, best fattened and best dressed pig, all the regulations specified to be complied with by the competitor.

8. Each competition to be under the supervision of an officer of the Department of Agriculture. He will have the right to visit the premises of competitor and to rule out any competitor from the competition at any time for any cause which he may deem sufficient.

Information as to the best method of feeding and caring for pigs will be supplied by the Livestock Division, Department of Agriculture, Fredericton, N.B., the inspector to judge and award the prizes according to merit from each county.

9. At the close of competition each competitor shall file with the inspector an estimate of cost of the production of the pig and shall also furnish the inspector with a declaration, signed by his parent or guardian, that all the conditions, rules and regulations of this competition have been faithfully complied with.

Prizes

First Prize	$10.00
Second Prize	7.00
Third Prize	5.00

To J. B. Daggett,
Secretary for Agriculture,
Fredericton, N.B.:

Potatoes Cheaply Grown.

A recent boys' potato contest in Cheshire county, N. H., brought out some fine yields, despite the unfavorable season. Arthur Welcome of Chesterfield was the young man who captured first prize. He harvested at the rate of 532 bushels to the acre, which cost him 24 cents a bushel to produce. The following table gives the names of other boys with their commendable records in bushels to the acre:

Record Yields of Potatoes

Name	Yield.	Cost.
Arthur Welcome	532	24c
George Lehtinen	474	30c
P. Richardson	347	39c
Donald Hale	316	39c
Herman Hale,	302	42c
Herman Stearns	280	42c
Harold Averill	297	34c
Roland Goddard	285	41c
Richard Stearns	299	41c
Merle Cobleigh	276	40c

Of the 77 boys who planted potatoes in this county contest 26 had a yield above 200 bushels to the acre, 13 above 250, five above 300, two above 400, and one above 500. There were five boys whose crops average them less than 35 cents a bushel to grow.—N. E. Homestead.

SOWS KILLING THEIR YOUNG

What is the explanation of the killing or eating of their young by sows?

There are many reasons advanced, among them being a feverish condition induced by over or improper feeding. Corn in quantity is condemned on this account, while a flesh diet is said to excite an appetite for animal food, which is satisfied at the expense of the young ones. Thrist has also been adduced as a course, and it has been recommended that a supply of water be provided. Constipation and a feverish condition affect the brain, and the excitement attending parturition may add to the evil, and there is no doubt that the frenzied sow will often then snap at a pig, and yet prove a kind mother to the remainder later on. These, then ,are things to be guarded against, and altough they may not be the cure for a so-called vicious sow, attention to the state of the bowels and the general health during gestation, and particularly during its closing days, undoubtedly goes a long way towards preventing the trouble. Dead pigs should be removed immediately. Yet another cause—and probably a fruitful one—of a sow killing her young arises from their hurting her teats. The teeth of the youngsters are very sharp, and they are apt to use them, especially when the udders are "caked" and swollen. This leads to reprisals; the sow snaps at the offender, and if she hapens to catch him it is bad for the pig. To prevent this injury to the teats, some breeders take off the sharp little teeth with a pair of nippers. There is no cure for a really vicious sow, and, unless she has some special value, or there are extenuating circumstances to be plaeedd in her favor, the sow that has once eaten her young should not be bred from again, but should be promptly fattened out or sold for this purpose. No sow, at any rate, should ever be allowed a third opportunity of offending.

FREE--FREE--FREE

Two Weeks' Course in Agriculture

AT THE

Agricultural School, Woodstock, N.B.

MARCH 20th to APRIL 1st, 1916

The First Week will be devoted to Fertilizers, Soil Management, Insect Pests, Plant Diseases and Spraying.

The Second Week will be devoted to all classes of Live Stock and Field Crops.

The only expense to you will be Board while in Woodstock and Railway Fare at Reduced Rates. Purchase a Single First-class Ticket to Woodstock and get a Standard Certificate from the Ticket Agent.

A list of suitable Boarding Houses will be provided to Students.

Applications for enrolment in this course will be received up to March 18th, but should be sent in as early as possible. Send applications and inquiries for further information and full program to A. G. TURNEY, Fredericton, N. B.

Experimental Orchard Work Season '15

By Prof. W. Saxby Blair.

The Nova Scotia Fruit Growers' Association is largely responsible for the establishment of the Experimental Station at Kentville, N.S. The need for such a station in this Valley was prominently set forth and championed by a limited number of enthusiastic individuals backed by this Association. Soon after the station was established it was found that as there were no established orchards for experimental work on the station farm it would be necessary in order to meet the present requirements of the fruit grower to secure orchards outside of the station for such work. To bring this about a special meeting of this Association was convened at Kentville in August, 1912, at which a petition was presented to the Honorable Minister of Agriculture for the Dominion, Mr. Burrill, asking that money be granted for such work. The assurance was given by Mr. Burrell that the petition would receive every consideration. The matter later received the sanction and support of the federal representatives from the Valley and the necessary money for this work has been furnished. This in brief is the history of the establishment of the Experimental Orchard Work which has been conducted under my supervision as a part of our Experimental Station work during the past three seasons.

It was found to be difficult to secure satisfactory orchards for extensive comparative tests owing to lack of uniformity in trees and a mixture of many varieties, and the orchards selected were not all that was desired, but they were as good as could be found at that time. I want to say that in the location of these orchards for our experimental work I am entirely responsible and the orchards selected were those where I thought the best work could be done, and if I have lacked in judgment in the matter I am to blame and not others, and am prepared to take all the responsibility.

The work conducted in 1913 under this appropriation is now printed and will be found in the Horticultural Division of the Experimental Farm report for the year ending March 31st, 1914. The 1914 work is not yet issued but will be found in the report of the Horticultural Division of the Experimental Farm report for the year ending March 31st, 1915. You, however, have had an opportunity to study the work conducted during the period mentioned in the report of this Association which have in part printed the results of our work. The 1915 work I will outline briefly for you today and the results will appear in the report more in detail. Our experiments have been confined principally to apple scab control and the matter contained in this address covers these experiments only.

I am indebted to my assistant, Mr. R. D. L. Bligh, for the records secured at Berwick and Falmouth, and to Mr. M. P. Pike for the records obtained at Bridgetown.

We have made every effort to avoid error in the work and have duplicated the experiments at each orchard as much as possible.

In considering these results it should be kept in mind that we depend entirely upon the hydrometer test in making our lime sulphur sprays. Were all brands of commercial concentrated lime-sulphur of the same density this would be unnecessary, but there may be a variation in density of from 1.26 to 1.30 in this product in which case a gallon of the 1.26 specific gravity concentrate is added to 40 gallons would give a much weaker spray than if one gallon of the 1.30 specific gravity concentrate is added to 40 gallons. The method to follow is to first test the concentrate one is using.

We were using the Grasselli concentrated lime-sulphur which gave a 1.30 specific gravity test. In order to find out the dilution required for a spray of 1.008 density the decimal of this spray is divided by the decimal of the concentrate thus: (1).300 ÷ (1).008= 37½ gallons, or 1 gallon should be diluted to make 37½ gallons of spray. If a concentrate has 1.26 specific gravity test and a 1.008 spray is desired you should proceed as follows: (1).260 ÷(1).008=32½ gallons of spray, or 1 gallon should be diluted to make 32½ gallons of spray. Any reference made as to the dilution in this address is based on the specific gravity test of the Grasselli concentrated lime-sulphur.

The approximate date of fall bloom at the different orchards was as follows:

Variety	Bridgetown	Berwick	Falmouth
Gravenstein	June 4	June 3	June 6

The dates of application have varied somewhat at the different orchards, but in all comparative tests the sprays were applied on the same days. In the majority of the tests two sprays were put on before the blossoms and two after.

It is interesting to note that from the 15th May when first spraying work at Berwick started, there was more or less sunshine every day to the end of the month except on the 16th, 18th, 22nd and 28th. Rain fell the 15th, 16th, 18th, 19th, 22nd, 23rd, 24th, 27th, and 29th. The total precipitation, however, was only .85 inches of which .42 fell on the night of the 19th and 27th. It will be seen therefore that the weather to June 1st was fairly favorable for scab development. From

N. B. Farmers and Dairymen in Annual Convention

The fortieth annual convention of the New Brunswick Farmers' and Dairymen's Association was held in the council chamber, Fredericton, on February 28th, 29th, March 1st and 2nd.

J. T. Prescott, president of the association, occupied the chair and conducted the business of the various sessions with dignity and dispatch.

It was thought that owing to the date of the opening of the Legislature being postponed that the attendance at the convention would not be so large as in other years, as not a few farmers like to come to Fredericton when the House is in session and get an insight into how the business is conducted. The tendency therefore in past years was that although there would be a large representation of farmers in the city during convention week, the attendance at the meetings would be rather small.

The various sessions this year saw the best and most interested attendance in the history of the association and proves conclusively that farmers can be just as much interested in their own parliament as in the parliament of politicians. It also proves that the holding of the association meetings concurrently with the opening of the Provincial Legislature is not in the best interests of the association.

The President's Address

Fellow-members of the Farmers' & Dairymen's Association of New Brunswick, the Minister of Agriculture of New Brunswick, the Mayor and City Council of the City of Fredericton, and Gentlemen:

With very great pleasure we welcome you to this, the 40th annual asembling of our Farmers' Parliament.

We had hoped to be privileged to open this session with the knowledge that our great Empire and her Allies had accomplished the task forced upon them more than eighteen months ago. We are obliged to admit, however, that the toll of blood and money yet to be sacrificed to the god of militarism will be appalling before a victory full and complete is realized. Indeed, with more than three-quarters of what have been regarded as the most highly civilized, progressive and intelligent nations of the earth engaged in the struggle, and a very considerable portion of the remainder in an unsettled condition, only the predictions of the most astute military expert, as to the probable termination of this awful carnage is worthy of consideration. Most highly civilized, did I say? Germany prefers the term cultured; and well it is she does so, for to speak of civilized Germany after her rampage through heroic little Belgium would be suburb irony. Some months ago, in our moving pictures houses, a picture entitled "Quo Vadis" was exhibited portraying the acts of the wicked emperor Nero and his satillites some two thousand years ago. Thenceforth was this being characterized as the most wicked, profane, sensual, lewd, and carnal of all humanity. We ask you, is the picture any more abhorrent than that of the march of the Hun through the little state just mentioned? No, a thousand times no. Super Nero and his salellites have the old Roman beaten blocks. So let us bend our energies that the complete collapse of his Empire, his ideals and his teachings shall be brought about with all possible despatch.

In tendering our sympathies to our honored Premier, and our hope for a rapid and complete recovery from his illness, we are confident that we voice the feelings of not only our asociation, but those of the population of the entire province. We enjoyed his presence and his address at our last session, and had hoped to have him with us again this year.

To be deprived of the privilege of witnessing the ceremonies in connection with the opening of the Provincial Legislature will, no doubt, be a disappointment to many, and is to be regretted, as they are invariably inspiring and full of patriotism.

The address of the Lieutenant-Governor, with its succinct history of matters affecting the various operations of our Government during the year and of future undertakings contemplated which is educational and intensely interesting to the thoughtful farmer, on a vacation, will be much missed; as will also the privilege of meeting the representatives and perchance of witnessing them in action on the floors of the house.

However, our own little Parliament should be the gainer, and we hope it may.

Right here, I crave the privilege of saying a few words of regret at the loss sustained by the various farmers' organizations throughout the Maritime Provinces in the removal of Col. H. M. Campbell from his regular vocation.

Of gentlemanly address, distinct in speech, of strict integrity, thoroughly impartial, conversant with the rules of debate, he made an ideal presiding officer, and we predict that his qualifications for protecting and advancing the interests of the farmers of this province will with difficulty be duplicated.

I feel satisfied you all join me in wishing him success in his new sphere of action, and that with his estimable family he may be spared to return among us blessed with his usual health and strength.

Thus we chronicle our disappointments and regrets.

Being beyond our control, our interest wanes, and to the future we turn, philosophically, perhaps selfishly, to consider our interests, to satisfy our lust for power, to discern opportunities for control. Thus it becomes my duty as presiding officer of your association to bring to your notice problems demanding, it seems to me, your earnest attention.

This being a matter of opinion, errors of omission and commission, I presume, are pardonable.

In the order of their merit, as they appeal to us, we propose to make brief reference to the issues and problems most vitally affecting our fellow farmers of this province.

Uppermost in our minds comes the question of the prohibition of the liquor traffic.

Up to a few short months ago the progress made toward a satisfactory solution of this problem had been altogether too slow for enthusiasts, and, we believe, for the greatest good of our nation; but in the good old Anglo-Saxon way, it has been sure. Fiery invective, woeful picture-painting, denunciation, and much of argumentation, the weapons of warfare up to perhaps ten years ago, are, we believe, not required in the present day campaign. In fact, it is our opinion that campaign work as it used to be carried on is about done except what will be required in the settlement by ballot.

We hope and believe that our representatives will have seen with ourselves the advanced sentiment on this question, and will provide the opportunity anticipated for a settlement.

This may sound too optimistic, but to those who have had the cause of Prohibition at heart for thirty or forty years there appears a monstrous rift in the dark cloud that formerly presented itself on occasions devoted to the discussion of this great question

The results derived from the banishment by the Czar of Russian of the trade in intoxicating liquor within his Dominions are of sufficient magnitude to convince the most sceptical as to the marvellous increase in the efficiency of all the attributes that characterize a nation as physically, mentally and morally strong. Think of it. Just nicely recovered from defeat by a nation greatly her inferior in point of numbers and physical stamina, within a year from the banishment of their national beverage, vodka, and for eighteen months engaged in the most colosal war of all time, physicians testify to the health, financiers of the wealth, and priests to the character of Russia, as never so great in the history of the nation. Other peoples hitherto considered superior in intelligence, character, industry, education and wisdom are forced to follow the lead of Russia in the abolition of a habit that will mark a sublime era in the history of nations. Unpopular as is monarchial government, the edict of the Czar of Russia will cut a deep niche in its hall of fame. Its influence is already wonderfully extensive, and is making history in many places.

The action of the Synod of the Church of England recently taken at its meeting in this city makes worthy history.

I have not the honor of the acquaintance of the esteemed head of the church in this province, but I have been fortunate in being able to be present at some of his addresses, and I am free to confess I was not astonished at his action on the question of Prohibition. I believe he has impressed the people of this province with his noble ideals and fearless character and predict that the moral and spiritual growth, due to his influence, will be very great.

Farm labor is a problem that is engaging the attention of many agriculturists.

For a number of years the competition between the captains of various industries other than farming and the agriculturists has been very keen. As a result of this scarcity and also the great disproportion in the hours of labor necessary for the securing of competence between the learned professions and artisans on the one hand and the farmer on the other, the common laborer is master of the situation.

Of the one hundred and sixty-eight hours in a week, the legal gentleman works from thirty to thirty-five; artizans work from forty-eight to fifty-four; common laborers work from sixty; farmers' laborers from seventy-six to ninety-two. In the opinion of many this circumstance is bound to become a most serious handicap to the important branch of dairying. Unless to the various operations applied to the manufacture of dairy products that are now performed by the cow; in which case the difficulties machinery is added that of milking in the solution of the problem will be materially lessened.

This dissatisfaction is caused by the great disproportion in the hours of agriculturists to become a prime factor in the formation of unions of agriculturists.

Already the Western and Upper Provinces of the Dominion have become enthused, and the spirit of union has assumed undreamed of proportions, resulting no doubt, from the progress reported and the benefits accruing to those in the membership of the organizations.

A start in a small way has been made in this province, and results extremely satisfactory have been obtained.

While no great fault can be found with our law makers, yet in none of our legislative halls is the representation of the tillers of the soil up to the proportion to which the importance of their calling entitles them. And we assert the fault lies at their own door.

The question of recruiting from the ranks of farm laborers to assist in the great struggle in Europe has attained sufficient importance of late to warrant some comment.

In the early stages the Imperial military authorities made a call for men. The heroes of our little nation have responded nobly, and viliantly they have fought we are told. They have earned the gratitude of the Mother Country, and from all reports it is given in full measure. For bravery, coolness, nerve and brawn we are told they have no superior in Europe. And we are not surprised. Some have fallen. We sympathize with those who mourn. More than once have we been saddened. The loss of such heroes to any country seems almost beyond recompense. More still are wanted and more still are going. We have no serious criticism to make except to offer a word of caution as to the class from which recruits are drawn. Perhaps you may count it selfish, but far be it from me to approach the subject from such a standpoint.

For some time we have been observing the depletion of farm labor—never any too plentiful—these last few years, and now with this added solicitation and to the adventurous young men somewhat attractive inducements, it seems that over the gerater part of these eastern provinces, if the slogan of greater production is to be made capable of realization, a halt must be called and some means be taken to discover where the agriculturist is at.

Thoughtful observing, truthful citizens have preceded us in this warning which has been anticipated. One of the most clever and observing patriotic correspondent of the agricultural press has within the last two months written several articles on it. The last issue of one of the oldest and best farm journals on this continent, has an article on the subject full of suggestions.

We feel we can safely state that a good average crop was harvested in the year just passed in all products with the exception of potatoes, turnips and fruit, for which we return thanks to the giver of all things.

We wish to recognize the deep spirit of interestedness manifested toward our business both by the Federal and Provincial administrations. We are confident that the head of our Department of Agriculture in this province will do all things in his power to elevate the calling and advance the interests of those engaged in the different branches of agriculture. The many advantages acquired for improvement in all lines of our calling during the last few years prove that this department has been full of energy.

A short reference to the subject of good roads and we are done. It would seem to us that an advance in the matter of good roads might well be planned by our Provincial Government. We realize that this is an era of economy and that any scheme which draws heavily on the exchequer is out of the question. But we submit that the road law of this province can very easily be improved upon, and a scheme whereby a campaign of education calculated to enlighten the people on the subject and prepare the way for the adoption of an impoved system in the near future is in order.

In the city of Toronto during the second week of this present month a conference of county road superintendents was held which cannot help but be of great benefit to the entire province of Ontario. Many more subjects

that are worthy of discussion present themselves, but the committee on resolutions will be at liberty to bring them before you for discussion. We wish to emphasize the importance of the members of this association taking part in the discussions. It is our farmers' parliament, and it is the stated wish of the Department of Agriculture that the utmost freedom for such discussion be allowed. We ask your kind asistance in the performance of the duties devolving on all the officers of the association and trust the session will be profitable to all, permeated with a spirit of harmony and good will, and that although we have made mention of dark clouds, they have a silver lining and is but necessary to "turn them inisde out till the boys come home."

Address of Welcome

His Worship Mayor Mitchell of Fredericton, formally welcomed the delegates to his city and the reply thereto was made by A. G. Dickson, vice-president of the Association. Mr. Dickson said the object of the farmers parliament was to acquire more knowl edge in order to make our calling in life a success. He also referred to the beneficial effect of the exchange of ideas between practical farmers. He put forth a plea for greater effort in crop production during 1916 than we have ever done in the past and thus do our bit in keeping up the very necessary war munition—food for the brave empire guardians.

In the absence of Hon. Jas. A. Murray, Minister of Agriculture, who purposed being present, but was hurriedly called to Ottawa on departmental business, Mr. Daggett, Secretary for Agriculture, expressed the Minister's regrets at not being present. Mr. Daggett also referred to the various numbers on the programme and strongly urged that the various subjects be thoroughly discussed. He called particular attention in this respect to the addresses on Potato Growing.

The Vice-Presidents' Reports

from the various counties were then received and taken as a whole were the best reports ever presented at the Association. These reports will be published later in our columns.

Prior to the closing of the Monday evening session the president named the following committees:

Resolution Committee—A. G. Dickson, M. A. MacLeod, A. J. Gaudie, J. A. Bernier and J. Anderson.

Audit Committee—Geo. J. Dickson, Isaac Baird and Thos. Harding.

Tuesday Morning

The Tuesday morning session was devoted to addresses and discussions on Potato Growing. Two excellent addresses were delivered by G. C. Cunningham, Dominion Plant Pathologist, and Dr. W. J. Morse, of Maine State Experiment Station. How to increase the average yield by careful attention to the question of keeping the common potato diseases in check as well as a strong emphasis on the question of good seed, was the thread of both addresses. Lester Wood, of Kings county, read an excellent paper on potato growing from the standpoint of the small grower, who does not have the acreage nor facilities employed by the larger growers.

Valuable discussions followed the various addersses and all three of the speakers proved that they had a good grasp of their respective subjects. Mr. Wood has recently expressed his views on potato growing in the columns of the Maritime Farmer. Eextracts from the other addresses will appear later.

Tuesday Afternoon

The first number on Tuesday afternoon's programme was the subject of "Production and Marketing of Farm Produce," by H. H. Smith of Hoyt Station, and W. H. Moore, Scotch Lake. Mr. Smith expressed himself very emphatically in favor of diversified farming. He believes in putting everything on the market as the finished product and as direct to the consumer as possible. He outlined his system of onion, strawberry, cabbage, rhubarb, and other garden truck growing. He also gave some valuable recipes for putting the various products in the most finished form.

Mr. Moore laid special emphasis on quality goods put up in attractive packages and humorously related his experiences in bringing his produce to market by automobile. He being the first farmer to introduce this innovation in the Fredericton market. The idea is working well and there is more call for his produce than he can supply, quality and attractiveness are winners in his case.

Dr. Morse, who gave a short talk on powdery scab, said he did not consider this pest as serious as was at first anticipated.

Geo. H. Barr, chief of the Dairy Division, Ottawa, addressed the meeting on "How to Widen the Margin of Profit in Dairy Production." As a means to this end he put quality and attractive package ahead of everything. He told of the rapid progress that is being made in the production of quality dairy produce by the Western Provinces, also by Nova Scotia and Prince Edward Island. He advised the farmers of New Brunswick to awake and do their utmost for the production of a class of goods that will hold the market for them against all comers. At the present time he said there was less being done along this line in New Brunswick than in any other province of Canada. He advocated more up-to-date creameries and equipment, and that prospective cheese and butter makers be given facilities whereby they may qualify to become as efficient in their calling as may be.

C. W. McDougall emphasized the value of cream grading and paying according to grade and quality.

Harry Mitchell was present and took part in the discussions. He also read a resolution passed at a recent meeting of the Prince Edward Island Dairymen's Association asking their government to co-operate with the government of Nova Scotia re the establishment of an up-to-date Maritime Dairy School in connection with the Nova Scotia Agricultural College, Truro.

Mr. Barr explained the working of the Dairy Act and in reply to questions gave reasons why cream tests vary.

On Tuesday Evening

Mr. McAllister, Maritime Secretary of the Y. M. C. A., appeared before the convention and explained the aims and objects of the Y. M. C. A. in the military camps. The talk was well received and before the convention closed a subscription list amounting to a considerable sum was made up for the furtherance of Y. M. C. A. work.

Mr. Barr continued his talk on Dairying. He laid special emphasis on the cow testing work, advocating better feeding systems and gave instances where herd production had been more than doubled by following those methods in less than five years. He strongly advised farmers to have nothing to do with breeders of pure bred scrubs—put them out of business by not patronizing them. Buy only the bulls that have records behind them. It is expensive for one farmer to buy such a bull, but let him combine with neighbors and establish something along the line of community breeding.

On Wednesday Morning

E. D. Eddy, Chief Dominion Seed Inspector, delivered an excellent address on the seed situation.

S. J. Moore referred to the growth of the Provincial Seed Fair and the excellent showing of small seeds.

Prof. Cunningham talked on the eradication of club root in tnrnips along the same lines as reported in a recent issue dealing with this subject before the Nova Scotia Farmers' Association. He showed conclusive proof that liming the soil heavily and carrying on an intelligent system of crop rotation would eradicate this disease.

John Wood, the drainage machine operator for the province, gave an interesting and instructive talk on drainage and the operation of the government ditcher. His address was one of the "practical" kind and it so appealed to his hearers.

On Wednesday Afternoon

Mr. Wood continued his talk on Drainage and B. Leslie Emmerson gave an address on "Value of Potash in Commercial Fertilizers." He was plied with all kinds of questions on fertilizers and fertilizing ingredients in general and was equal to the occasion every time.

Resolutions

Resolved that the thanks of this Association be extended to the various speakers who so ably addressed us during the present convention.

* * *

Resolved that the N. B. F. & D. A. in convention asesmbled extend their thanks to the mayor and city council of Fredericton for the free use of the council chamber for the purpose of holding our meetings.

* * *

Resolved that the New Brunswick Framers' and Dairymen's Association endorse the movement for temperance reform and prohibition that is being carried on by the Dominion Temperance Alliance and kindred associations.

* * *

Whereas the farmers of New Brunswick feel the need of more advanced methods in farming and dairying,

And whereas the facilities for education along these lines are not equal to that of the Western Provinces, or even Nova Scotia,

And whereas the finances of the Maritime Provinces, individually, are inefficient to maintain educational institutions up to the standard of those in the Western Provinces.

Therefore, resolved: That the Farmers and Dairymen's Association in convention ask our Legislature to give us such assistance as will enable us to co-operate with the other Maritime Provinces in establishing a Maritime Dairy School in conjunction with the Nova Scotia Agricultural College at Truro, and maintaining and developing those institutions up to a standard second to none.

* * *

In deference to the large percentage of French speaking population in the Province of New Brunswick and to the large representation of said class attending this Association, we respectfully ask that at least one session of future N. B. F. & D. A. conventions be addressed by French speakers, so that these delegates may hear agricultural questions discussed in the language they best understand.

* * *

Resolved: That this convention memoralize the Minister of Agriculture to bring before the legislature a bill for the enactment of the following laws:

(a) That some such law be introduced into this province similar to that now existing in the province of Ontario known as the Drianage Act.

(b) That said Government take some action to enable the farmers to procure tile at a reasonable price either by bonusing the manufacturer or by getting reduced rates on the different railroads or both.

(c) That the Legislature take steps to further aid the farmers in underdrainage by enacting a law similar to that known in Ontario as the Provincial Aid to Drainage Act, which has been worked out so successfully since 1911.

* * *

At a later meeting a resolution asking the Government of Canada to remove the duty on comemrcial fertilizers in the unmixed state was carried.

The Wednesday Evening Meeting

was held in the Opera House, where a large audience was presided over by His Honor, Lieutenant-Governor Wood.

The meeting took the form of a conference on agricultural needs of the Empire at war. After the Lieutenant-Governor had addressed the meeting Col. P. A. Guthrie and Dr. C. C. James, Dominion agricultural commissioner, addressed the audience, the former re [illegible] fill up the ranks and the latter re the call for a greater effort to produce [illegible] men.

On Thursday Morning

the Association listened to an interesting address on "Lime as an Aid to Fertility" by Prof. M. Cumming. Prof. Cumming's address will appear in full in the next issue of The Maritime Farmer.

As soon as Prof. Cumming had completed his address the delegates wended their way to the railway station where they entrained for a visit to the Experimental Farm.

After the various farm buildings had been visited, Prof. Cumming gave a demonstration talk on horses. Prof. Barton, of McDonald College, delivered one of the most instructive talks on dairying and live stock ever listened to by a Maritime audience. Dinner was served at the farm. About 4 o'clock in the afternoon the delegates returned to the council chamber in the city where Mr. W. W. Hubbard read a paper on Farm Drainage.

Thursday evening

The election of officers resulted as follows:

President, Geo. E. Fisher, Chatham; vice-president, A. J. Gaudet, Memramcook; treasurer, H. H. Smith, Hoyt; recording secretary, Chas. W. Shaw, Hartland; corresponding secretary, A. R. Wetmore, Clifton.

County vice-presidents, Albert, J. R. Paisley, Beaver Brook; Carleton, Dr. McIntosh, Hartland; Charlotte, Stanley Wilson, Rolling Dam; Gloucester, S. Demnas, Grand Anse; Kent, Premilife Johnson, St. Paul; Kings, Leslie Wood, Carter's Point; Madawaska, G. A. Bernier, Edmundston; Northumberland, A. G. Dickson, Chatham; Queens, Isaac Baird, Chipman; Restigouche, John McKinnon, Eel River; St. John, Alex. Johnston, Upper Loch Lomond; Sunbury, H. L. Dibblee, Hoyt; Victoria, Donald Innes, Tobique; Westmorland, Frank Fawcett, Sackville; York, W. H. Moore, Scotch Lake.

R. P. Steeves, Director of Elementary Agricultural Education delivered a masterful address on "Elementary Agricultural Education in his usual convincing manner. His remarks were closely followed by the audience and will undoubtedly be the means of sperading the seed of this deservedly popular educational system to all parts of the province.

Prof. Barton followed with an address on "Swine Raising," illustrated by lantern slides, which was brim full of practical suggestions. Suggestions that where they put in parctice are bound to very materially swell the stock breeder's revenue.

Lack of space prevents the publication of a full report of the various addressesses in this issue. We will, however, publish extracts in future issues.

The fourth annual convention of the Association was the best and most interesting ever held by the New Brunswick farmers. Never have we seen the interest so keenly maintained to the end of the various sessions.

Votes of thanks were tendered to the retiring president, and to the various speakers who so ably assited to make the convention such a decided success.

THE MARITIME FARMER.

And Co-operative Dairyman
Registered Trade Mark

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said :—"I saw" your adv. in the MARITIME FARMER.

RATES FOR CASUAL ADVERTISEMENTS.

PATRONIZE PROGRESSIVE BREEDERS.

The day is past when any progressive dairyman is keeping a sire merely that his herd may continue to give milk. The sire is the logical beginning and source of herd improvement and for that reason we cannot afford to have a poor one.

A Biblical adage says: "By their fruits ye shall know them." A well recognized breeding law is summed up in the words "Like begets like." These truisms are the guide posts to the selection of sires that the farmers of the Maritime Provinces are gradually learning to follow.

As we pen these lines our thoughts revert to the various Maritime Province breeders of dairy cattle, whom we have personally known since the Maritime Farmer was first published over twenty years ago. We have known them all and have watched their breeding career with considerable interest.

As we know these breeders we can distinguish three main classes, viz.:

1. Those who have no special aim re winning at exhibitions or re making records in the dairy tests.

2. Those whose only aim is to try to win prizes at exhibitions, and, on account of publicity thus attained, sell their surplus stock.

3. Those wo do not lay stress on exhibition winnings but who pin their ideals on the cow that can produce milk of good quality and a lot of it in the dairy and under offical record tests, or who are striving for both show and record of performance fame.

Of the first class all we have to say, after closely observing their operations for many years, is that they never get anywhere. They may have some good producers in their herds and they may have individuals good enough to win at the fairs, but they are not ambitious enough to try.

For many years the breeders repersented in the second class made a brilliant showing at the fairs. Their surplus stock was in demand—they prospered for a time while farmers were short-sighted enough to buy on pedigree only. But with the change in the trend of public opinion re buying on the records of ancestry, a change came to the breeders of this class. The demand for their stock fell off and slowly but surely many of them have dropped from the zenith of their erstwhile glory until today we find not a few of them practically down and out so far as breeding operations are concerned. They could not give the farmers intelligent answers re the production of the various cows in their herds consequently the farmers refused to buy "a pig in a bag" so to speak.

The breeders of class three did not make very rapid progress at first but surely and steadily they gained ground. They kept faithful production records of the various cows in their herds and now they are reaping their well merited reward. The breeders who keep records of their stock are the only breeders who are doing any business worth while now-a-days. They are patronized by the farmers because when buying from them they can get the kind of information they want.

To patronize a breeder who does not keep records is suicidal to progress. You do not know what you are being offered. The chances are that you are buying pure-bred scrubs. The death knell of the scrub is being tolled in the Maritime Provinces. Help it to ring out the pure bred scrub as well.

Unquestionably there are some pure-bred dairy bulls that are less valuable from the point of view of influencing herd production than some grade bulls, but we do not advocate the use of animals of either of these classes. Today it is comparatively easy to ascertain the producing qualities of a pure-bred bull's immediate ancestors and no man should purchase a herd sire without doing so.

The pure-bred animal represents not a single life-time of breeding, but rather many generations of careful breeding and selection. Originally this pure-bred stock came from the best which its home land contained, and since that time the strain has been improved by generations of careful breeders.

The grade sire, on the other hand, represents at best but a very few generations of breeding and selection and for that reason he cannot be expected to transmit what good qualities he may have inherited with as much certainty as his pure-bred cousin.

With a good, registered sire and high grade heifers of the same breed a man can reasonably expect to improve his herd, but with a grade sire such improvement is impossible because there is no source from which better qaulities may be brought in.

THE COUNTRY SCHOOL.

In an address on "The Stability of Agriculture," before the recent meeting of the Association of Life Insurance Presidents, Senator Wadsworth of New York spoke first of those things which tend to increase the material prosperity of the farmer and standardize his business on a firm foundation. He calls this the dollars and cents side of the question, but he believes that to increase the stability of agriculture great emphasis should be placed on the kind of education given by our country schools. In concluding his address he said:

"People living in the country are not very content simply with accumulating a savings account and paying off their mortgages. They think very deeply about the future of their children and they are intensely ambitious that these children shall receive the best obtainable education. They cannot help recognizing that the educational facilities of the cities, and by that I mean particularly what might be called the routine education, are vastly superior to the facilities of the country. When they make this comparison they no longer have that implicit faith in the old fashioned country school house. They want something bigger and better and more attractive from many standpoints, social and educational, for their children. They know that the country school is, generally speaking, the same old country school and that in many respects it does not respond to their desire for progress; it does not fulfill their aspirations for their children. And as many a farmer whose children have reached school age and many a country boy or girl anxious to develop themselves through education, tear themselves from old associations and move to the city where they are confident they can enjoy the facilities which they desire.

"I think this comparative failure of the country school to keep up with the educational procession has more to do with the movement from the country to the city than any other one element; and I, for one rejoice that there has recently been inaugurated a movement in several states, echoes of which are heard in Washington for the modernizing of the country school. I think we can all ecntre a goodly share of our efforts in support of this movement. In the natural course of events, life in the country has been brightened remarkably. The improved road, the rural delivery, the almost universal use of the telephone, and the astonishing use of the automobile are some of the important factors which have helped to bring this about. But none of these facilities, valuable as they are, affect the lives of people living in the country as fundamentally as the school. The man who lives in an environment which offers but comparatively meager possibilities for the development of his mind knows instinctively that he is missing something of deep and vital importance in his life; and the yearnings of human nature in this direction are so intense that the man will inevitably seek a more favorable environment for himself and his children; and no amount of effort put forth to enable him to fill his pockets with money will drive that yearning from his soul.

"I verily believe that the next great organized effort for the advancement of agriculture and the preservation of a thriving and contented country population must be directed toward the upbuilding of the country school. Work of this sort is in line with the highest purpose of government and upon its successful accomplishment must rest the continued success of our wonderful experiment in democracy."

Dr. C. C. James, in his address at the opening of the new Domestic Science Building on the N. S. A. C. campus at Truro, sounded practically the same sentiment expressed in the foregoing paragraphs.

Read Prof. McCready's address at the Susssex Short Courses in the last two issues of the Maritime Farmer.

Don't forget the Short Courses to be held in the Agricultural School, Woodstock, N.B., from March 20th to April 1st. "Time and money well spent" is the unanimous verdict of the farmer or farmer's son who has ever attended a short course in agriculture. The course will practically revive you to a greater sense of the importance of your calling. Time and again you will be able to put in practice some of the short cut ideas set forth by the instructors and your fellow students at these courses. "Come with us and we will do you good," is a very applicable expression when talking short courses.

Experimental Orchard Work Season '15

(Continued from Page 341).

the 1st to the 6th June inclusive the weather was unusually bright and unfavorable for scab development and favorable for blossoming. This was followed by dark weather on the 7th, 8th and 9th, with fairly bright weather on the 10th and 11th. Rain fell on four days following the 8th which amounted to 1.01 inches, over half of which fell on the 9th, when blossoms were at their best, after which they soon disappeared. It will be seen that the time during latter part of the blooming period was particularly favorable for scab development. The next two weeks following the 11th June was more or less dark with rain on eight days.

It is interesting to note that the greatest foliage injury occurred when rain and dark weather followed the application of the spray, and also that the soluble sulpuhr plots showing the greatest per cent of scab were these which had a rather sharp fall of rain the day following the application which would seem to indicate that soluble sulphur is less adhesive than lime-sulphur.

The orchards used are fairly well matured and three trees have been used to each experiment. The aim has been to make comparative tests with trees which have been developed under apparently similar conditions and adjoining each other, and for this reason there may be some difference in the results from the same spray on the different series of plots. In every case the product of the plot has been carefully sorted and the percentage of slight, medium and bad scab obtained. In many cases the per cent of scab was only slight which fact is not shown in the total per cent. here given. It has been noticed that polts adjoining the check plots often show a decidedly high per cent of scab, and this is what we might expect. Plots for a check, however, left unsprayed are necessary in order to check up the work.

Dormant vs. No Dormant Spray.

Experiments were continued this season to get further information as to the value of the dormant spray put on before the buds open to control scab. Different strengths of lime sulphur were used in these early sprays and the results would seem to show some gain although the gain is not sufficient to make this a necessary spray. It will be noticed that the percent of scab from nine plots is 7.13 per cent. and that this does ont include two plots at Bridgetown where there was 36 and 21 per cent of scab. These two plots were high in scab owing to being adjacent to a plot not sprayed which resulted in a light late infection and were these included the average would be 11.51 per cent scab on the plots receiving other than the dormant spray.

It will also be noticed that tests have been made with various strengths of lime sulphur for the first spray and the three following sprays similar. It would appear from this that there is no advantage in using a strength greater than that generally used for this spray. The plot where the 1.010 strength was used also adjacent a check plot and the high per cent of scab in it can in this way be accounted for. The results would seem to confirm previous experiments that the dormant spray is of little value and that a strength of spray greater than 1.008 is unnecessary.

Guard Against Wiles to Down Co-Operative Movements.

Editor The Maritime Farmer:

Co-operation between farmers, or organization for mutual benefit, is a theory that all will agree is sound and that every farmer should loyally support.

Our creamery and cheese factory industry was the first line along which farmers organized. Before creamery butter came on the market, the dairy article was usually traded at the country store for goods, was a drug on the market and a source of but little revenue to the province. Since the advent of the creamery, our butter is always in keen demand for spot cash and our creameries find it hard to supply the demand.

To operate a cheese factory or creamery successfully it is necessary that every dairyman, or owner of dairy cows, patronize the factory and supply milk as long as possible throughout the year. The larger the amount of milk handled, the cheaper it can be manufactured. Every man should, therefore, feel duty bound to support a creamery or cheese factory, if at all convenient. By making a uniformly good article these factories have found a good market abroad and by taking the bulk of milk created a better demand for all grades of dairy butter. However, the ruling price of the latter is usually five cents below creamery butter. It only costs three cents a pound to manufacture the factory article, and few home makers can get as much butter as a trained maker. It is poor business and a selfish, mean act for any one to withdraw his support from a business, that has helped everyone in the dairy business so much, in order to take advantage of a little local market now available.

If everyone would do as these few are doing, we would soon have the same old glutted market and a ruined industry. No reasonable man should expect others to support an enterprise for his benefit. To slip out of helping any co-operative concern, operated for the benefit of all for what we may imagine is a little better paying proposition for the time, is not at all clever—it is a narrow, short-sighted and small action.

It is surprising to learn that almost every season, on nearly every route, some new discontented dairymen that have supported the creamery for years drop out and make their butter at home. This sort of thing will weaken and often ruin a paying plant.

Several years ago the farmers' pork factories of Ontario were put out of business by their own patrons being foolish enough to let the old packing houses have their hogs for a trifle more than the market would justify—for a little more than they should know their stuff was really worth. They let their own lost hundreds of dollars each year since. This seems to be just human

In recent years egg circles have been organized in this province, and the advantages of selling eggs by this system must be apparent to everybody. Those familiar with the business tell us that 15 per cent. of the eggs received by the dealers under the old system were bad. This meant that in fixing a price they had to reckon that fifteen in every hundred had to be lost by somebody, and it was easy to guess that the producers had to stand this loss, whether their own particular lot was good or not. In fact, I have heard a man try to justify himself for selling some stale eggs with the statement that the price was fixed to allow for 15 per cent. bad anyway, so he might as well put them in. However, we all know that is poor business and when a system was devised that would guarantee to the producer of good eggs the full price and make the careless fellow lose what he was entitled to, besides looking out the best markets and paying the highest prices that such markets would justify, you would think everybody that was in touch with such a worthy organization would support it. We find bitter opposition from many country merchants and others interested in the good days of trade and the same tactics are being worked here as were used so successfully with the framers' pork plants in Ontario.

When a country merchant offers a cent more per dozen than the Circle, it does not matter whether it is above the best market quotations or not, it is hard to hold some people, and while this enterprise will outlive all opposition, it will have a hard enough time.

I will also instance the co-operative selling of lambs and wool. The bulk of lambs in this vicinity were sold at 6 to 6¼c live weight last autumn, while at the same time a farmer's institute in the western part of this province advertised for tenders for the selling of some 1200 lambs, and sold for 7 cents. They also received advantageous range of weights as the above prices quoted were for the best weights in each case. This one institute received five or six hundred dollars more by selling co-operatively then they would have received by selling in the old fashioned way. The advantage of selling wool in this manner was fully as great and if carried out all over the province would amount to a surprisingly large sum.

If we as farmers were properly organized so that numbers could be depended upon to stand together, how many different products could we not largely control the price of. It is often stated and true enough it is, that a farmer never has the privilege of setting a price on anything he either buys or sells. If he offers anything for sale, the question is what will you pay? If he buys anything it is what do you ask? Such being the case, whose fault is it?

Conditions need not be like this if every man joined an organization and stood loyally by it. We would have more to say re what prices we receive for the products we offer for sale. It seems hard to make much advancement along this line, at present, but before we withdraw our support from any cooperative association formed for our mutual good, to take any selfish advantage opponents may offer, we should consider what would happen to our business if everybody did as we purpose doing.

W. M. LEA.

Practical Suggestions on the Use of The Fanning Mill.

In using a fanning mill, one must be governed by the conditions of the grain he is cleaning. As the different grains have different weights per bushel, it is necessary, not only to use different sized screens, but also to regulate the wind, shake and speed of the mill to suit the different weights and sizes of the grains to be cleaned. The first thing to do is to thoroughly examine the grain, see what there is in it, and make up one's mind as to the best way to clean it out. The fanning will will only separate grain or seed of different size or weight. The wind of a fanning mill is one of the most important factors.

In cleaning oats for seed, regulate the machine according to directions on the mill. The first operation consists in blowing out all the chaff. Most of the very small seed will go through the screen under the hopper, but a certain amount will go through the screen in the lower shoe. To make a perfect job and to get all the larger weed-seeds, such as vetches, cockle, wild buckwheat, or even wheat and barley that are not the same size and weight as oats, the grain must be put through once of twice more.

The second cleaning requires quite a different operation. The riddles are to be arranged as for cleaning wheat, and anything of the size and length of wheat should go through the riddles and the large, long, heavy oats should go over the back of the machine. Care must be taken to see that the proper slant is on the riddles, so as to carry the oats over and all other grain, etc., down under the mill. In regulating the wind and shake, use very little wind, as you do not want to blow any of the light seed or small wheat or barley over with the oats; and have very little shake, so that the oats will not be stood on end and go through, but slide over the back of the machine.

In cleaning wheat for seed, after the chaff and small seeds are all removed, take out one or two of the wheat riddles and open up all the wind doors wide open. Good plump wheat weighing 60 pounds per bushel and over, will take more wind than the average fanning mill can supply. The good heavy grain cannot be blown over, but all the lighter grains, also oats and barley, ought to find their way over the back of the machine. Care must be taken to use conductors to carry the grain near enough the back of the machine to give the wind a chance. When there is still some small grain or seed left, I have sometimes found it necessary to run the grain through twice.

Should white caps in wheat (wheat hulls) be found troublesome to remove, select one of the long screens belonging to the lower shoe just large enough to let the wheat through—place the screen directly under the hopper, and this will extend far enough back to carry the white caps out over the machine. This long screen will also be found most useful when cleaning oats, whenever there are thistle tops or joints of oat straw amongst the grain.

Many experiments have proven that careful fanning pays many times over for the trouble in cleaning the seed grain. You have pure, clean, seed, free from weed seeds; and, besides, the longer and plumper seed produces heavier crops.—J. Fixter.

Shipping Potatoes in Cold Weather.

The shipping of potatoes during freezing weather is such an important operation and so much money is involved that information as to the correct method of shipping should be generally disseminated, and it is indeed surprising that the railroads do pot publish circulars and printed matter on this subject.

The free use of straw or mill shavings is advised in the shipping of potatoes during cold weather, except, of course, when fires are to be maintained in the cars while in transit. Fifteen hundred pounds is generally allowed per car of these materials, and certainly this much at least should be used. Four to six inches of mill shavings or straw on the bottom of the car is necessary and it is important that the corners be well filled before putting the sacks in the car. The straw or shavings at the sides and ends should be higher than in the centre.

The sacks as loaded should be laid three in a row across the car. This will leave space between the sacks and the side of the car which can be packed with straw or shavings. It will take about five tiers of sacks in height to give a maximum carload. It is important that the sacks bind together so that there will be no jolting or movement in the car, and it is therefore, necessary to pack the shavings or straw tightly around the sides and especially at the ends. After the car is loaded, at least six inches of shavings or straw on top is necessary. It will be found that four inches of shavings will give better portection against frost than six inches of straw, as they pack tighter and prevent circulation of air.

It has been found in practice that papering a car with building paper, or any heavy paper, on the inside, is a distinct advantage. This is especially true at the ends of the car and around the doors and it should extend a foot or eighteen inches up on the sides and ends of the car and be held in place with a lath nailed along the top edge of the paper.

Due precaution, with the use of straw, mill shavings and paper will cut down some very heavy losses and eliminate damage claims. The railroads

(Continued on Page 464).

HORTICULTURE.

The Blackberry may be grown by Everybody.

By L. R. Johnson of Missouri.

After several years' experience with small fruits a friend tells me that the blackberry is his most profitable fruit, and that he shall plant it more and more largely to the exclusion of other kinds. My own experience concurs in many respects, and for the last two years I have steadily increased the area of blackberry plantings at the expense of other small fruits.

There are several reasons for this course. The scarcity and high price of labor have militated especially against the strawberry, the cost of whose culture far exceeds that of any other small fruit. The black raspberry is a failure here unless planted in the shade of trees, and this cannot always be provided. There are objections against the other small fruits, except the grape which makes an excellent supplement to the blackberry.

The general advance in prices has not exempted the blackberry, and my estimate is that it is selling, at least in our local market at 20% more than three years ago. Only a fraction of this has been absorbed by rising labor cost, which is attributable to the fact that the culture of the blackberry is the simplest and cheapest of all the small fruits, and, with the exception of pruning, can be conducted by the cheapest grades of labor.

The blackberry possesses several qualities that act in its favor. One of these is its hardy and rugged character, combined with its general freedom from diseases an dinsects. There is no small fruit that can endure neglect with as little injury, a trait that ti inherits from its wild ancestors, to which it is still closely related. It requires no spraying and thus avoids one of the most expensive operations to which horticulture is subject. There is only one disease, the rust, that is able to inflict serious damage, and from this many of its varieties are compratively exempt.

Most Profitable of Small Fruits

It is a very heavy producer, and, acre to acre, its income is probably greater, on the average, than any of the small fruits. Not only is its yield heavy, but it is also exceedingly regular, far more so than the strawberry whose gross acre income may occasionally exceed it. In all my experience I have never known a total failure of the blackberry.

The blackberry is not exacting as to soil, but like all other plants, it has preferences, and we must satisfy these in order to reach the highest degree of success. The fundamentals of profitable blackberry culture, are, first, a deep, loamy soil filled with humus; next, abundance of moisture; than an annual mulch to conserve moisture and decompose into humus and plant food. These once understood, the next question is how to provide them. We cannot easily manufacture a loamy soil, so if it is not on the farm we must select the soil that nearest approximates it. A clay soil is generally good, because it holds moisture well and usually contains a good amount of plant food. Any soil that can produce corn, can produce a crop of blackberries. An orchard is a god place to plant not only blackberries but other kinds of small fruits, provided room is left for cultivating and spraying.

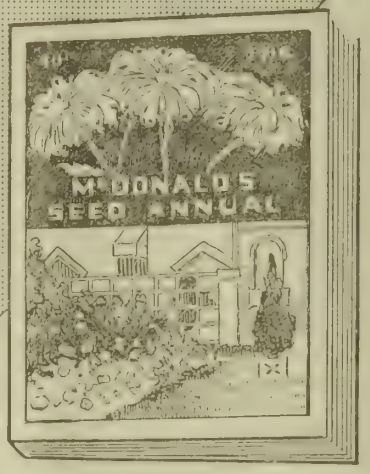
The next fundamental, moisture, we can combine with the fourth requisite, a mulch. We may safely say that wherever there is a good deep mulch, there is always a good supply of water for the roots, for the mulch prevents evaporation. The mulch, also, as it decays, provides a continuous supply of humus, and we know humus to be a great absorber and retainer of water.

But what shall we choose as a mulch for the material to make it grows scarcer and scarcer? In many localities the wheat area is being annually curtailed and straw is increasingly difficult to procure. Everyone must answer this question according to his circumstances. If there is a cheap supply of straw, an ideal method of culture would be to cover the ground in and between the rows with straw deep enough to prevent the growth of weeds and grasses. The very finest grades of berries, both in size and quality, would be thus assured. Strawy stable manure is a fine mulch except for the grass seeds it usually contains.

Mulch Culture Gives Best Results

My own plan is this: Straw is too expensive, therefore I try to raise mulching material. I discovered that in late summer after the berries had

McDonald's TESTED SEEDS TRUE-VIGOROUS-RELIABLE



Send for *your* copy today

This Book Will Help Increase Your Crops

EVERY farmer or gardener in Canada ought to have a copy of our new **1916 Seed Catalogue**—just off the press. It contains illustrations, descriptions and prices of hundreds of varieties of seeds, cereals, vegetables, flowers, grasses, etc., also fertilizers, and farm and garden implements and supplies.

A COPY FREE for your name and address

Write at once so that your copy may reach you before you are busy with Spring work. Have it ready for handy reference during that busy season.

This is our fortieth year in the Seed business. For that length of time **McDonald's Tested Seeds** have been growing good crops. In every part of Canada are farmers and gardeners who will not risk their crops by taking chances on the quality of their seeds, but protect themselves by using only **McDonald's Tested Seeds.**

Your name and address on a postcard will bring a catalogue by return mail.

NEW TOMATO "ALACRITY"

Developed by experts at the Central Experimental Farm, Ottawa.

EARLIEST OF ALL RED TOMATOES

ALACRITY produces a closer compact vine, set quite as freely with fine smooth tomatoes which are usually ready to market ten days earlier than any other strain.

The entire crop can be gathered generally in about three weeks from the time the first fruit ripens.

ALACRITY is undoubtedly the very best earliest scarlet fruited tomato.

been picked ,a rank growth of crab and other grasses sprang up to a height of two feet and made an excellent cover crop for fall and winter. In the spring this grass, now dead, is raked from the middles up to and around the canes and there is enough of it to make a fine mulch. After this the middles ar cultivated up to the mulch on each side and this is continued unti lthe crop is gathered. Occasionally, if it appears to be needed, a dressing of stable manure is applied. This system, then combines both the mulch and clean culture systems.

Where there are no native grasses to come up, I should sow rye and vetch,. The handling of cover crops requires plenty of room between the rows, and 10 feet is not too much. Every fourth row there should be left an extra wide middle to admit a wagon for hauling manure and collecting the prunings of the canes.

Let us begin with the spring and follow the work of the blackberry field through the year. First in order is the pruning. With leather gloves and a sharp pruner, this is not a difficult job. First the main cane, if too tall, is cut back to a point that insures its ability to stand upright under its load of leaves and fruit. Next the laterals are cut off at varying distances according to size and number.

The larger the limb the longer I cut it, and the more ilmbs the shorter I cut them. The object is to leave no more buds of bearing wood than the vitality of the vine will support. Roughly speaking, I cut limbs 15 to 18 inches long and top main canes at three ot 4 feet hi ,hgacc - cg$ 1 3 to 4½ feet high, according to their strength. In case of extra prolific kinds, such as the Early Harvest and Taylor's, I cut a third shorter than this. We must regard pruning as simply a form of thinning the fruit and it is better to err on the side of too close rather ahan too long pruning. To allow a vine to overbear means not only small berries of poor quality, but a weak growth of new canes for next year's crop.

How and When to Prune

Pruning finished, the cut limbs are hauled out and burned. The blackber-

FIRE NOTICE

RENNIE'S SEEDS

We desire to advise our many customers that although we have suffered a very large loss in Sunday's (February 20th) fire, we have sufficient stocks stored at our warehouse at Long Branch and other warehouses in Toronto to enable us to fill orders complete and to take care of the coming season's trade. We commenced shipping on the 21st at noon, and orders will be handled in our usual prompt manner.

RENNIE'S SEEDS, Head Office: TORONTO - - CANADA

Our Montreal Branch has been supplied with their season's requirements.

Practical Garden Tools

TOOLS like these will do all of the necessary work (except plowing) economically, whether for home, farm or market. You can plant certain crops close and straight, and work them safely, with wheel hoes. You save ground, save heavy investment at the start and yet do the best kind of work with proper tools.

IRON AGE *Hand Seed Drills and Wheel Hoes*

Will sow, cultivate, ridge, furrow, etc. better than you can with any old fashioned tools and ten times quicker. Pushed ahead a step at a time, these tools can be worked by women, or grown boys or girls. We show here a few only but we make 38 styles and combinations from which to choose. Prices, $3.00 to $14.50. There are also many attachments for special work.

Ask your dealer to show them to you. Write for our Catalog and Garden Manual.

The Bateman-Wilkinson Co., L't'd 432 Symington Ave. Toronto, Ontario.

ATTENTION POTATO GROWERS

A CONVENTION OF POTATO GROWERS WILL BE HELD IN THE FISHER MEMORIAL SCHOOL, WOODSTOCK, N.B., ON MARCH 22nd AND 23rd, 1916, IN CONJUNCTION WITH THE AGRICULTURAL SHORT COURSES HELD AT THAT INSTITUTION.

This Convention has been called at the request of several of the most progressive potato growers who realize the importance and necessity of encouraging the potato industry.

In 1914, New Brunswick porduced 10,000,000 bushels potatoes. In 1915 the yield was about 6,000,000 bushels. A good yield such as can be raised on our farms would be 15,000,000 bushels to 20,000,000 bushels, on the same acreage.

Why are we raising only 150 bushels per acre when we should raise 350 to 400 bushels? Come and learn why some are already producing 500 bushels per acre.

This is to be a Potato Growers' Convention. If you are interested in Potato Growing you cannot afford to stay away. Every problem will be discussed: Varieties, Fertilizers, Cultivation, Diseases, Methods of Improvement, Marketing and Standardization, together with exhibits of Different Varieties Potatoes, Potato Diseases, Potato Machinery and the Dominion Experimental Farm Agricultural Exhibit.

Some of the best authorities in America on Potato Growing will be present to take part in the very full and comprehensive programme that has been prepared. Among those who have promised to be present are: Dr. C. C. James, Dominion Agricultural Commissioner; J. H. Grisdale, Director Experimental Farms, Ottawa; E. S. Brigham, Commissioner of Agriculture for Vermont, who is considered to be the most progressive and successful potato grower in Vermont; W. T. Macoun, Horticulturist, Central Experimental Farm, Ottawa; J. D. McKenna, Manager of the Maritime Farmer, Sussex, Recruiting Officer for Kings County, and other speakers.

DAIRYING.

Annual Meeting—LaHave Creamery Company Limited.

The third annual meeting of the La Have Creamery Company, Limited, was held in the Court House, Bridgewater, N.S., on Friday, February 15th. About 125 of the shareholders were present and the interest was keen in all that pertained to the welfare of the company. Live and enthusiastic discussions took place on all the different branches of the business which showed that the shareholders were making an intelligent study of the affairs of the company.

The chair was occupied by the president, C. R. DeLong and was filled in his usual energetic business-like way.

The secretary-treasurer's report was read by the secretary manager, J. D. McKenzie, showing an increase in butter made from 40,000 lbs. in 1914 to over 139,000 lbs. in 1915, of a value of $41,000 and ice cream of a value of about $1900, about $22,000 worth of merchandise was handled, making a gross turnover of about $65,000 and a neat surplus on hand for the benefit of the shareholders and patrons.

The election of directors resulted in Mr. H. T. Hebb being elected in place of Mr. L. M. Hebb and the other retiring directors, C. R. DeLong and Asom Ernst being returned to office.

Mr. W. A. McKay, Dairy superintendent, was present and expressed his satisfaction on the splendid showing made, the business like way all questions were discussed, and the live interest shown by all present. He then dwelt on the importance of quality of butter made and recommended a system of cream grading whereby the patrons would be paid in accordance with the quality of the cream sent, as the most practical means of keeping the butter up to the highest qaulity, which resolution of the company was adopted.

The production end of dairying was dealt with by Mr. Harvey Mitchell, Maritime representative of the Dairy Division at Ottawa, who informed the meeting that Mr. A. L. Crosby, now of Lawrencetown, had been appointed as dairy recorder for Bridgewater and Yarmouth creamery districts and impressed upon the meeting the importance of cow testing.

It was decided to hold a patrons' picnic at the creamery during the coming summer, the arrangements to be made by the directors.

This creamery company although only two years in existence has made a remarkable showing; has at present about 440 patrons and the prospects of an increased number during the coming year; operates over a large territory, over ½ of the cream coming in by train and the prospects are it will be one of the largest in the province.

South Creamery Co., Ltd., Holds Annual Meeting.

The annual meeting of the South River Creamery Company, Limited, was held at Loch Katrine, N. S., on Tuesday afternoon, February 15th, and was in point of numbers and enthusiasm by far the best yet held.

The secretary treasurer's report showed an increase in business done of over 66%, 88,040 lbs. of butter was made of a value of over $22,000 distributed among 165 patrons. The 1914 output was 49,000 lbs. After paying all expenses for the year a neat surplus was left on hand and a 6% dividend declared on paid up stock.

The retiring directors were re-elected for a term of three years, and prospects are very bright for the coming year.

Mr. R. B. McLennan, dairy recorder for the district reported some splendid gains of production in individual herds and for 215 cows in regular test for the year, an average gain of $9.83 per cow over 1914.

Mr. W. A. McKay, Provincial Dairy superintendent, was present and complimented the company on the splendid showing made during the year and dwelt on the importance of keeping the quality of the output up to the highest possible standard, and recommended the adoption of a system of cream grading to attain this end, which on motion was unanimously carried by the meeting.

This creamery, although only three years in operation, is already doing a splendid work over the territory that it serves and we confidently look for it to do a much greater work in the future. The principles of cooperation are being worked out in a practical way and on every side appears better evidences of prosperity than heretofore.

Full Ration of Air Increases Milk Flow.

When a dairyman endeavors to increase the output from his cows, he almost invariably increases the ration. Only to a very small percentage has the thought occurred that increased product means the use of more air as well as more feed. The production of milk is work for the cow and it requires no argument to convince that more air is inhaled and exhaled when an animal is at work than when at rest.

If the cows are out of doors or in a stable that has ample ventilation, the matter need receive no attention. On the other hand, if the supply of pure air is not sufficient to fully supply the requirements of the animals, it is useless to endeavor to increase their output by increasing the ration of feed.

An experiment conducted by the Wisconsin station some years ago furnished some interesting results upon this point. Twenty cows were used in the test. They were subjected to poor ventilation for two days and then to good ventilation for two days and this process was repeated four times. At the end of these eig .t days they were given good and poor ventilation for one period of three days each.

No difference was found in the amount of feed eaten under the two conditions, but the cows averaged a little more than a half pound more milk per day when they had good ventilation than when they had poor.

That there was a difference in their condition as regards health is shown by the fact that the cows had lost in weight to the extent of 10.7 pounds per cow as an average at the end of each period of poor ventilation and regained their weight during good ventilation. They drank 11.4 pounds more water per cow daily when receiving insufficient ventilation.

The conditions under which these tests were made were not distinctly different from those existing in many stables. The cows were kept in a half basement stable. During periods of poor ventilation the hay chutes were closed and at periods of good ventilation they were open.

Skimmilk and Butterfat.

A prominent Holstein breeder informed us the other day that he was feeding $2.00 worth of butterfat each day to his calves. It has been his opinion that a better calf could be developed by feeding whole milk instead of skimmilk. Another breeder, raising the same kind of cattle, feeds whole milk for two weeks only and then uses skimmilk, and it is his opinion that better calves can be reared on skimmilk than on whole milk. Our observation and experience lead us to believe that skimmimlk is a better feed for dairy calves than the whole milk. For the first few months calves fed on skimmilk may not have as sleek and smooth coats, but when they shed their baby hair, which is done when they are about eight months old, their appearance will be quite as satisfactory and their growth fully equal, is not superior, to those fed on whole milk.

The skimmilk should be fed warm and fresh or as soon as it comes from the separator, or disappointing results will follow. The feeding of cold, or tainted, or too much skimmilk is invariably the cause of producing unthrifty calves. The calves' milk should be weighed each time for the best results and increases in allowance made very gradually. When skimmilk is properly handled and fed there is no necessity for feeding butterfat worth 30c a pound to grow the right kind of dairy calves. Skimmilk for growing animals is a much better feed than most people realize.

Calves on Skim Milk.

Which are the skimmilk calves, was the puzzle. Two lots of four calves each, one fed whole milk and the other skimmilk and boiled flax seed. The two lots looked equally sleek and thrifty. Mr. Peters, animal husbandman of the North Dakota Experiment Station, explained that the experiment was undertaken to determine how well dairy calves could be grown on skim milk.

The first three weeks both lots were fed whole milk. From then on, Lot No. 1 was fed 8 pounds whole milk and 8 pounds skim milk daily, while Lot No. 2 was given 16 pounds of skim milk and one pound of boiled flax seed, which replaced the fat taken out in the cream. During the first three months Lot No. 1 made somwhat larger gains and looked a little more thrifty, but during the next three months, Lot No. 2 caught up. At six months several experienced dairy cattle breeders pronounced the calves in .Lot No. 2 equal to those in Not 1 in individual merit and dairy development. When the calves were five weeks old they were also fed clover hay and a grain ration made up of equal parts whole oats and bran. To this was added one-tenth by weight of linseed meal. It cost $19.00 less per head to feed the skimmilk calves than those fed half whole milk, to the age of six months.

EASY Churning—

—churning that is more of a pastime than a labor. That's the kind of churning a MAXWELL'S "FAVORITE" does. The mechanism is so perfect—so smooth. And it gives splendid results.

THE Maxwell "FAVORITE" CHURN WITH BOW LEVER

is used in thousands of dairies—in Canada—Australia, New Zealand, S. Africa and Denmark. It produces butter with a minimum of effort. Used in Agricultural Colleges. Praised by Government Inspectors as the finest butter maker in the world.

Get your dealer to demonstrate the unique features of the MAXWELL "FAVORITE" (with Bow Lever)

Milking a Kicking Cow.

Many devices for handling cows with sore teats have come to my notice. The best suggestion among those I have read is, "Always soften the teats with lard," but when a cow has torn the teats on barbed wire or thorns something more is necessary. Back in the summer, one of my cows which is a very heavy milker calved before I expected her to do so. I had noticed her the evening before and thought that she would go two or three days longer. Evidently she calved in the night and I did not see her until noon the next day. Two of her teats which the calf did not suck were so distended that the skin had begun to crack. Though a very gentle cow, she vigorously objected to having those sore teats milked. She was in the pasture and all the devices for preventing kicking which I had previously tried were applicable only to stable milking. I took two hame straps and connected them with a harness ring and buckled one around each hind leg. I softened her teats with lard and went at it. She fussed a bit at first but soon stood still and let me finish the job without further trouble. I have always noticed that if you fix a cow so that she can't kick she will soon give up trying, but if you let her kick and then whip her for it, she will hit the last lick no matter how long you keep it up. Many a naturally quiet cow has been made vicious in that way.

Milk Material.

How can you hope for the production of milk when you do not provide the cow with suitable feed from which to manufacture the milk? Is it reasonable to expect a liberal flow of milk from the cow fed on musty, stack-fired, discolored hay and a stinted allowance of grain feed? How would these conditions compare with the same cow fed on all the bright green clover hay that she could consume from morning until night, week-in and week out, and, besides a liberal feed morning and evening of cornmeal, shorts and bran, with a little oilmeal, the whole mixture moistened with warm water, just to suit her taste? Would you be skeptical if such reverse feed conditions would increase the milk flow from 25 to 50 per cent? It is a question of giving the milk factory suitable material from which to manufacture milk, material that has available milk properties for this machine to work up. Too many cows are starved until they do not represent half their ability to yield milk.

If testing the cows, do so often enough to be able to find the correct average for each cow. Tests vary greatly and often inexplicably. Apart altogether from what are termed normal variations from milking to milking, besides the variations between mroning and evening, and the variations bewteen the fore milk and the strippings, careful observers have noticed in two days a variation in the test of almost two per cent of fat in the milk of individual cows, for which no reason can be assigned. Obviously, then, it would be quite unfair to judge any cow on any one isolated test when it might be 3.0 one day and 4.8 another day. Which could you take? A fair and just way is to take samples regularly and test a composite sample once a month. Then there will be credit given where it is really due, not necesarily to the one that is supposed to be a high tester because she is of fancy name of fancy price, but possibly to some despised individual which is really the queen of the dairy.

Heavy cream means a smaller amount to be taken care of, hence it is likely to be more thoroughly cooled and re eive better care.

It costs less to buy a DE LAVAL than to buy experience

EACH year some 40,000 farmers, who have bought at one time or another "cheap" cream separators, discard their inferior, cream wasting machines and replace them with clean skimming De Lavals.

These men bought the "cheap" machines because they thought they were "good enough" or "just as good" and that by purchasing such machines they could save a little money. They actually would have been better off in most cases had they bought no separator; for they lost most of the money they spent for the "cheap" machines, besides all the cream these machines have failed to get out of the milk.

No one ever saved money using a "cheap" cream wasting separator or an old or half worn-out machine. No one ever got back the money spent for such a machine by continuing to use it. Those who bought 'cheap" machines and got out of the difficulty best are the ones who quickly discovered their mistake, discarded the inferior machines and put in real cream separators—De Lavals.

There are nearly 2,000,000 farmers who have bought De Lavals, and every one of these had just as many opportunities to boy "cheap" separators as any one else. They did not do it and are now money ahead. They have avoided paying the high cost of experience, and their De Lavals have paid for themselves many times over. It always pays to buy a separator of proved, known superiority.

The nearest De Laval agent will be glad to let you see and try a De Laval on your own farm, without obligating you in any way. It is better to take advantage of this opportunity than to pay dearly for your own cream separator experience. If you don't know the local De Laval agent, simply address the nearest main office as given below.

Eureka
Potato Planter
Catalog sent free

The Eureka line of Potato Planters is the largest manufactured. This machine takes only *one* man to operate it. That means less trouble and expense for *you*.
Opens the furrow—drops the seed any distance or depth required—puts on fertilizer (if desired)—covers up—marks for next row. Always accurate and automatic.
It's an easy machine to operate. The steel and malleable iron construction mean lightest possible weight and increased life of machine. Your repair bill will be practically nothing. Plants uniform depth at *all* times because plow is directly under the axle. Dropping mechanism in plain view of driver. Does not injure seed.
We supply planters in three sizes, for one or two rows—with or without Fertilizer Attachment.
For 16 years the Eureka Potato Planter has been successfully used throughout the world.
We also make Eureka Potato Cutters and the Eureka Mulcher and Seeder—a mulcher, smoothing harrow, cultivator, weeder, seeder.

"Fly" or Maggot on Sheep.

The treatment for "fly" or maggot, has been frequently described in this journal, but it seems necessary to repeat a good deal of what has been alreday said for the instruction of the beginner or the careless reader.

The Symptoms

The victim of "fly" attack soon becomes very uneasy. It is at first restless and excitable, runs about, stamps its feet and sometimes tries to bite the part that is maggoted. A symptom that is considered particularly diagnostic is a peculiar shake of the tail, which, when observed by the experienced shepherd, always leads him to make a closer examination of the animal. As the mischief progresses the suffering increases, the sheep becomes dull and dejected, probably lame, loses appetite, and stands apart from its fellows, listlessly, with hanging head. The wool at the seat of attack is rough and raised, presenting a moist appearance, and as the maggots burrow their way deeper into the skin and subcutaneous tissues, close examination shows a moving mass of them. Unless they are destroyed and the wounds kept clean, the torture ends in the death of the sheep. It may be interesting here to note that there appears to be some confusion or misapprehension among writers on ovine diseases and sheep management as to the exact variety of "fly" responsible for maggoting sheep, and several are mentioned as concerned in it.

What "Fly" Causes the Mischief?

Most popular works on sheep state that the maggoting is caused by the common blow-fly or flesh-fly, but either entomologists are in error as to the reproductive habits of this pest, which is hardly probable, or the impression that eggs are laid in the fleece, and afterwards hatched into maggots, is erroneous. There is the third alternative of acquitting the comomn blow-fly of any part of the mischief. An examination of ten different works on sheep shows that one describes the "fly" as Musca vomitoria, one as Sarcophaga carnaria, one mentions both species as "prevailing in sultry weather," two describe it as the "large or common blow-fly," which they speak of as "depositing its eggs," or of the maggots as "larvae hatched from ova deposited in the fleece," while to the remainder it is simply the "fly," and nothing is said of its variety or technical designation. Years ago, when this question was under discussion, some specimens sent as the "fly" causing mgagots in sheep proved to be Musca Caesar. Of course, all these theories cannot be correct, and there is clearly a mistake somewhere, for entomologists tell us that in the case of the blow-fly or flesh-fly—Sarcophaga—the eggs are hatched in the oviducts, or in a special pouch, and the larvae produced alive, as many as 20,000 being born in a single season. Further, the larvae of Sarcophaga carnaria are described as feeding on dead animal substances. In the case of a sheep being attacked by a "fly" it is generally considered that eggs are deposited in the wool, especially about dirty parts of the fleece, and directly after the eggs ar hatched the maggots begin to burrow and torment the animal.

In the case of both the blue-bottle fly and the green-bottle fiy—Musca vomitoria and Musca Caesar—the larvae are not produced alive, but eggs are laid, which are, however, speedily hatched, and this seems much more like the procedure of the maggot-fly of sheep. Sarcophaga carnaria—the blow or flesh fly—is ovoviviparous, a kind of insect marsupial, which receives its own eggs into an abdominal pouch, and then basks in the sun until they are hatched, and ready to be deposited as living larvae on animal matter, proferably putrid. Musca vomitoria, the blue-bottle fly, and Musca Caesar, the green-bottle fly, are both oviparous, and of these it is, of course, more correct to speak of eggs "deposited" and "hatched." Either the blow-fly has nothing to do with maggoting sheep, or it is a mistake to regard the maggoting as resulting from eggs deposited. Probably a good many will regard the matter as of no great moment; nor is it, so far as the results to the sheep and the shepherd are concerned.

Things that Attract the Fly.

It is generally considered that the "fly" deposits its eggs on the wool, where it lives on the yolk, especially about the tail and other parts that are contaminated in diarrhoea and dysentery, or in some few cases by milk. Further, it finds out wounds, sores, and abrasions of all kinds. There are some who think that one kind of fly selects dirty wool, and another variety sores, and that when the former has got in its work the latter may join in and asist in the mischief. Everyone familiar with sheep understands that a wound is not an absolute necessity for maggoting, and that the majority of cases we get in summer arise quite independently of an abraded surface; or in other words, there are many more cases in which the "fly," be the variety what it may, is attracted by soiled wool, especially about the region of the tail, than by the existence of wounds; but that these are unimportant, or not extremely liable to become maggoted, is quite another matter. Not only sheep, but other animals have the same liability. Some time ago I spent hours in exploring and removing maggots from wounds in a dog, shot by a keeper, and left in a wood for several days, and these surfaces presented no difference in appearance from those found in the sheep. I have seen a cupful of maggots raked from a wound in the foot of a horse running in the field.

Nearly all authorities give prominence to the facilities that wounds offer for maggoting, and agree that in foot-rot, scab, eye and scalp injuries, and other disorders and accidents, the "fly" constitutes a serious complication in summer. No wound should be considered trivial at this season of the year, owing to the liability of sores of all kinds to become "fly-blown." May and June are considered the great "fly" months, but the attacks are generally continued throughout the summer, and in mild seasons are always more prolonged and continued well into to autunm—in fact, the flies seem to get fiercer and more troublesome towards the end of their time. In thundery weather, and after showers, the shepherd needs to be especially vigilant, unless his sheep have been properly dipped or otherwise protected. Even where this has been done attention should be paid to preventing the sheep and especially lambs, getting dirty behind, and such locks of wool should always be as soon as possible removed. Filth, no doubt, forms a congenial habitat fo the maggots, and a damp, foetid patch of wool will be generally found where they are actually at work. In bygone times powdering used to be a favorite method of preventing "fly" attacks, a mixture of poisonous drugs being dredged into the fleece. Old-fashioned country druggists used to sell hundredweights of "fly" powder, but it has gone very much out of fashion during recent years, and dipping and sprinkling have superceded it as being easier to use, more economical, and more efficient. They consist for the most part of mixtures of sulphur, arsenic, hellebore, white lead, cinnabar, burnt alum, Armenian bole, prepared chalk, and whale oil in various conbinations and proportions, with burnt umber of ochre to give the fashionable tint to the fleece. According to Steel, a few drops of fish oil sprinkled on the animal in May will effectually protect it for the whole season. He admits it gives the wool a peculiar smell which is difficult to get rid of, but, independent of this, I would rather trust to a reliable dip than to even a large qupantity of fish oil.

Prevention

Apart from dipping this must include the prompt treatment of wounds and skin abrasions at the time of their infliction, the removal of dirty locks of wool and the trimming of up parts contaminated, where, owing to the nature of the food, the bowels are relaxed or the animal suffers from diarrhoea. These precautions, however, will not entirely suffice, for experience amply demonstrates that the yolk of the wool will prove a sufficient attraction, and that no matter what care is taken, the "fly" will sometimes strike, especially on hot sultry days after rain, unless thehre is an application of of some agent that is either obnoxious to the "fly" or will prevent the development of the maggots.

The Poisonous Dip

This is where the poisonous dip gets in its work. What constitutes a good dip is a point on which there naturally exists a good deal of difference of opinion. The "poison" bogey frightens a good many, but properly prepared poisonous dips are perfectly safe if or-

dinary care be used and the maker's specific directions framed to ensure safety and efficiency are followed. A poisonous dip by remaining on the fleece will, if employed in the early part of the season, confer immunity from "fly" to a surprising extent, as well as prevent the development of the larvae, and compass their destruction if used as a "cure."

I am not an advocate of home-made dips. I hate a patent medicine man as the devil is reputed to abhor holy water, but there are some things that the specialist can do better for us than we can do for ourselves, and the manufacture of sheep dip is one of them. There is as little economy in attempting it as in making soap or candles, or spinning wool and flax, at home, and the usual result is the producion of an inferior article at an increased cost. There is first the difficulty in procuring the necessary ingredients, because the sale of poisons is hedged about with no end of restrictions, and, next, the enhanced price inseparable from the purchase of small quantities of drugs. There is the further expenditure of labor and fuel in procuring hot water or boiling, and the risk of poisoning half the parish from having superfluous material about the place. When sheep can be efficiently dipped with material that is readily soluble in cold water, and sufficient of it can be obtained to dip a score of sheep for 1s. to 1s. 4d., it is utter folly to be boiling up arsenic and soda to make a dip at home. Summer dipping after shearing, to ward off the attacks of the maggot-fly, is a most useful precaution, and should always be practised.

Destruction of the Maggots

Treatment for this is simple enough, but some of the agents employed are objectionable on account of their drastic character. Some still use "fly" powder referred to, or even powdered white lead, which is dredged over the part, and the maggots are pooked out with a sharp-pointed stick. It is best to start by clipping the wool, notwithstanding that when a large area is involved, it causes great disfigurement, because the mischief generally extends much farther than a superficial examination reveals, and maggots will be found beneath the wool at a considerable distance from the main seat of attack. In some districts shepherds carry with them, wrapped in a piece of flannel and enclosed in a leather pouch, what they call a "fly-stone." This is nothing more than a lump of perchloride of mercury, and I have seen a piece weighing at least 4 oz. in possession of a man who knew as much about its deadly properties as I do of pure mathematics. There is always a mystery about how large quantities of this poison, as well as of uncolored arsenic, the sale of which is illegal, is obtained. On finding a sheep "struck" with "fly," the shepherd pulls out his pouch, expectorates on his "stone," and rubs it vigorously among the maggots. There is no doubt about its killing them, but the drastic application of such a powerful corrosive is unnecessarily severe on the sheep, although I must admit never having heard of injury to the sheep or of subsequent trouble from its employment. It is a powerful antiseptic or germicide, and calculated to keep a wound healthy, but it would be equally efficient if used in a milder form. An example of a "fly" oil very popular in some districts is:—Perchloride of mercury and hydrochloride acid, of each 1 dram; spirits of tar, 2 drams; oil of turpentine, 1 oz.; boiling water to 8 oz. The mixture can be carried in a flat bottle in the breast pocket, and after shaking well together a few drops of the dressing should be poured among the maggots, taking care to involve them all.

There are plentyl of other agents that will kill them, inlcuding several of the essential oils. An American remedy is one pint of oil of sassafrsa in four parts of spirit. In ordinary cases—this is, where the maggoting is detected early, and the pests are killed—their destruction and a single dressing are all that is necessary, but in advanced cases, where the mischief is extensive, and ugly suppurating wounds and deep fissures are left, further attention is necessary. Some cover up the wounds with rags ot protect them from sun, air, and the attacks of other flies, but I am not enamored of the practice, and prefer to shelter the sheep and dress daily with a solution of one of the many soluble coal-tar preparations. Such wounds, when properly attended to, soon heal. For preventing "fly" attack on chance wounds or abrasions, the same antiseptic dressing may be used. A mixture of sublimed sulphur in carbolized oil is also very useful. It can be mixed together and kept in a can, and applied with a stiff brush after stirring. An ointment made by mixing: Oxide of zinc, 1 dram; pure carbolic acid, 10 drops; lard, 1 oz., is also a useful wound dressing, but to prevent the attacks that arise from dirty fleeces there is nothing like periodic dipping. —Pateley Bridge.

RAISE YOUR CALVES

By raising them and choosing the best you will be able to improve the standard of your herd and make bigger profits from it.

INTERNATIONAL GROFAST CALF-MEAL

enables you to do it without using up your milk for the purpose. It is a scientific preparation that contains all the nourishing elements needed by the calf.

Mixed with skim milk and you save your cream or butter for sale, thus increasing the cash income and decreasing the cost of keeping the dairy herd. It costs but a fraction of the value of the whole milk that would otherwise be required.

Write for our booklet on raising calves.

INTERNATIONAL STOCK FOOD COMPANY, LIMITED, TORONTO, CAN

Spraying Pays

SAVES your crop from loss, helps tree and plant to produce better and larger crops, prevents spread of disease, insures a longer life for trees and a longer growing time for vines each year. Blight hit potatoes in many states in 1915—many million bushels lost. Spraying would have saved them.

IRON AGE Sprayers

Include bucket, barrel, power and potato sprayers in many sizes and variety of equipment to suit each man's needs. We want to show you what each one is, how they are made and what they will do. Ask your dealer to show you these tools and write us for booklet describing all of them fully. We also have a spraying guide which we are glad to send.

THE HORSE

Strangles in Horses.

The agricultural bureau of New South Wales is an organization comprising many branches throughout the State. These branches are correlated to the Agricultural Department of the State, by whom an officer is appointed especially to attend to their needs and generally to organize the movement. The branches hold meetings at which papers dealing with agriculture, horticulture and kindred subjects are read and discussed. A brief summary of any paper which may have been read and of the discussion which followed it subsequently appears in the "Agricultural Gazette of New South Wales," the department's official organ. The following is a summary of a paper read by the chairman at a meeting of one of the branches on the subject of strangles in horses.

Mr. F. Tatlow said strangles was almost identical with the common ailment known as distemper; several veterinarians stated that they were one and the same. It usually appeared in young horses (colts or fillies), especially in highly bred animals. As it was a contagious disease all animals in the same paddock were likely to become infected unless they had previously suffered from it. Young animals contracted it more readily from aged than old from young. In stables where the complaint was discovered it was almost certain to attack all horses that were fed or bedded with the sufferer. Immediate isolation was recommended while the disease was in its early stages, and care should be taken to cleanse and fumigate all feeding troughs, boxes, and mangers where sick animals had been fed. Lime washing the walls, etc., of stables could not be too extensively carried out. The free use of tobacco wash could be recommended. Thorough fumigation of stables and feeding places with tobacco smoke or sulphur was advisable, and it should be carried out while the horses were in the stables. When animals were discovered suffering in paddocks they should be at once housed and treated in the above manner. The disease could be contracted by actual contact, and even at considerable distance the germs exhaled are in many instances responsible.

Symptoms

The symptoms noticeable in early stages were slight indisposition or listlessness, then in a few days a stiff neck, somewhat swollen throat, a dry hacking cough, and a thin watery fluid succeeded by a thick purulent discharge of a whitish color from the nose. The salivary glands, being inflamed, afterwards closed, pus then formed, and an abscess became pronounced. When suppuration took place in large quantities, it was an indication that the abscess had broken and the animal was then on a favorable way to recovery. It was essential that means should be used to encourage free discharge from the nostrils. In some cases suppuration continued for weeks, and even in extreme cases, which had come under his notice for months.

Treatment

To effect a cure in the early stage of disease, an animal that has been broken in should be rugged, kept warm in a well-ventilated stable, fed on light bran mashes, etc., and given "hay-tea" as a drink. Undue falling off in condition should be prevented. If the patient had difficulty in swallowing food it was advisable to give it in a liquid form or as a drench. In the event of the throat becoming closed, some authorities advised the use of a small cricket bat, or bat-shaped board, dipped in Stockholm tar; this was put down the throat as far as the abscess, or made to pass over the formation. When the lump would not discharge under ordinary circumstances a steaming process should be adopted by fixing on a nose-bag containing a bran-mash sprinkled with turpentine or eucalyptus; his experience had proved the latter the better. The frequent application of fomentations was desirable. A simple and effective foment was made by mixing two teaspoonfuls of mustard in a pint of water. The region affected should be bathed with this frequently, say, morning, noon and night. This treatment proved very effective in alleviating distress when an epidemic of strangles or distemper had broken out amongst 2,000 horses at a military encampment in connection with the 1901 celebrations. Should the discharge from the nostrils resist the treatment, an operation with knife or lancet would probably be necessary, and for this purpose it was advisable to obtain the services of a practical veterinary surgeon, who would give full instructions for the further treatment of the case.

Replying to questions, Mr. Tatlow stated that the disease was contracted from external sources, and more likely to manifest itself in damp weather, as the germs would then be more active. Fumigation would be more effective than spraying walls, etc., with germicidal preparations, as in the former the animal affected would inhale the fumes directly. The spraying would probably prevent the further spread of infection by destroying active germs. "Hay-tea" was prepared by immersing a bundle of hay in a can or bucket of water and allowing it to boil for an hour. When strained and cool enough it was given to the animal to drink or applied as a drench. In the aplication of Stockholm tar to the throat the gag would be of advantage to enable a clearer view of the affected part; if not available, a twitch could be used to raise the horse's head.

Locked-Jaw in Horses.

Locked-jaw is a spasm of all the voluntary muscles, but particularly those of the head and neck. The onset is generally gradual, but tetanus may be suddenly manifested. For a few days the horse may appear out fo sorts, off his food, partly chew and drop it, and gulp his water when drinking. Then the motion of the jaws becomes gradually considerably limited, saliva dribbles from the mouth, and inability to feed, although apeptite may not be in abeyance, becomes apparent. Presently the jaws become rigidly set and the mouth cannot be opened. The author of "Horses and Stables" says:—"The attack is characterized by closure of the jaws, great difficulty in use of the jaws, great difficulty in swallowing, rigidity of the limbs, and extreme difficulty in moving. The animal also pokes his nose, as if suffering from sore throat. As the disease advances the jaws become so tightly locked that neither food nor medicine can be introduced through them. Within three or four days, and sometimes earlier, the symptoms reach their height. The ears are erect and turned forward, the eyes are retracted, and the haw partly protruded over them. The nostrils are dilated. The animal stands persistently; his legs are stretched far apart and look more like wooden stilts than living structures. The tail is upraised, the belly is tense and tucked up, and the muscles everywhere stand out prominent and rigid. The voluntary muscles of the internal structures are similarly affetced. The involuntary muscles of the intestines are torpid, because the nervous force seems to be monopolized in the voluntary muscles. Hence arises the obstinate constipation which forms so marked a feature in this disease. Notwithstanding the intense contraction and rigidity of the muscles, the patient is highly sensitive and shrinks from the slightest touch or approach to a touch. The mere entering of the animal's box is frequently sufficient to produce violent tetanic convulsions. He sweats profusely and groans from pain. A very marked symptom consists in the rapid protrusion of the haw over the eye if the horse is touched under the chin, or if his head is eelvated. Death, unless the symptoms are relieved, occurs in from two to twelve days. The immediate cause in most cases is exhaustion. Tetanus, in some cases, by seizing at once, or almost at once, on some vital organ, may produce death very speedily, with scarcely any outward symptom except great pain and rapidly increasing prostration." Formerly, tetanus used to be described as 'traumatic" when associated with any wound or palpable injury, and "idiopathic" when there was no perceptible external injury. Now tetanus is known to be an infectious disease, and one of the large class due to a micro-organism. The germ in the case of tetanus is named the bacillus tetani, and the spasms are due to a poison or toxin produced by the bacillus. Once a typical case of locked-jaw is seen, the symptoms and appearance of the animal are not likely to be forgotten.

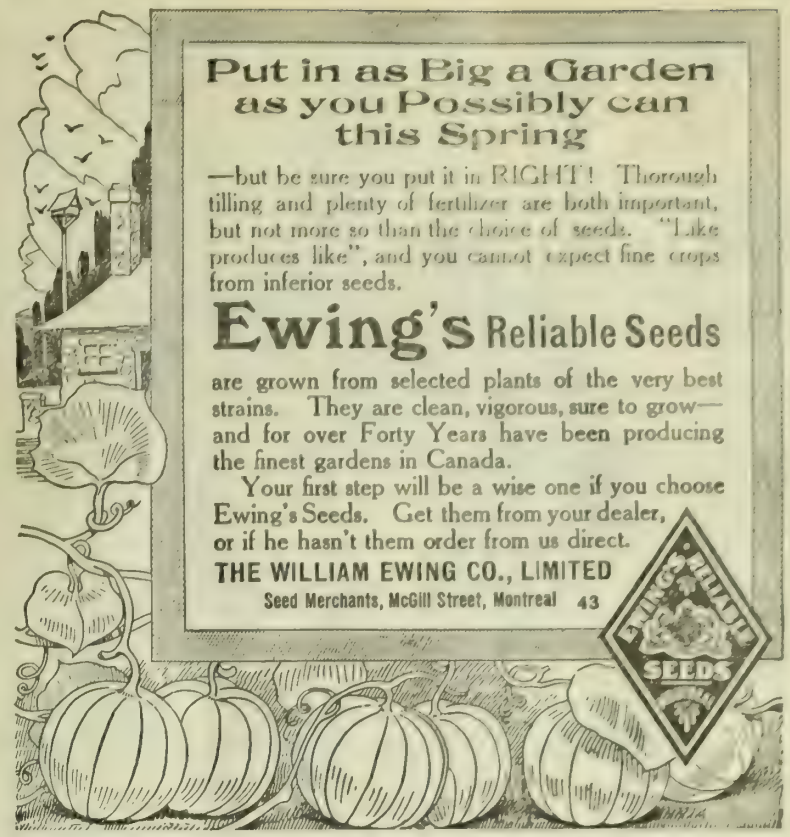
"Washy" Horses

Diarrhoea is not a disease, but only a symptom—generally of digestive derangement or of blood disease; but it is not always easy, even where there is opportunity for personal examination, to put the finger on the cause or to remove the trouble. Some horses are naturally more relaxed than others, and so well is this recognized that there is a popular name for them—they are described as "washy." They are generally free and fleet, but deficient in "bottom," for the simple reason that they are weakened by scouring. They are generally all right as regards their dung while standing in the stable, but purge freely when on a journey, and seem to lose as much flesh, getting narrow and tucked-up, in a 20-mile run as they can put on in a week of high feeding in the stable. There comes a time when animals start this game, and there seems no real cure for it, and such horses are only kept going by the exercise of great care in feeding and management. Palliation seems about the only thing that is possible. Such horses require to be fed on the best of dry food, and to have a restricted allowance of soft water. It is well to avoid the use of so-called horse mixtures which are offered for sale. One never knows what one is buying—all sorts of new, damp, mouldy rubbish goes into them—stuff we would not give to hogs if we saw each ingredient of the mixture separate and whole. If a mixture of maize, oats, barley, peas, beans, etc., is desired, the beter plan is to purchase sound old grain separately, and crush and mix for oneself. Old beans, sound, heavy oats, and good old hay are all good with a limited quantity of water before each feed, or, as a substitute for water, thin, well-boiled flour gruel. It is always well to be cautious in the use of astringents, but occasionally one of the following balls may be given: Powdered cinnamon and catechu, of each, 1 dram; powdered gentian and ginger, of each 2 drams; powdered capsicum, 20 grains; oil of aniseed, 20 drops; treacle to form a ball. Half-a-dozen of these should be made and kept handy for giving one when occasion seems to require it.—H.S.

Faults in Driving.

One often hears a good deal about this or that bit, or bridle, for restraining hard-mouthed, bolting, and other awkward horses, but I fancy more depends on the rider's or driver's hands than on the kind of bit or bridle. Some men have naturally better hands than others, and women as a rule have lighter hands than men. Good hands, I think, are, to a certain extent, a gift, for, though bad hands may sometimes be improved by tuition and practise, still, some people never acquire good hands, try as they will. From what may be seen on the road, in the hunting-field, and, in fact, wherever horses are used, bad hands appear only too common. Some people always ride or drive on one rein, which causes a horse to have a one-sided mouth, others drag so hard at the reins that in harness the horse seems to draw the vehicle as much by the reins as by the traces, or, if the horse is being ridden the rider looks as if he were using the reins to hold on with; in either case this constant dragging at the reins deadens, and in time spoils, the horse's mouth. Others, again, ride and drive with such a loose rein that they have little or no control over the horse. Constandtly jerking the reins while riding or driving is very objectionable, as it not noly punishes the horse, but renders his mouth less sensitive. Dragging or snatching at the reins when mounting a trap or saddle is a common fault, which may cause a tender-mouthed horse to run back or become a bad starter. The habit that some horses have of rushing off before the rider or driver is seated can generally be cured by letting an assistant stand at the animal's head, and by accustoming the horse to walk for the first few yards. Some people, although free from the foregoing faults, are still never able to establish that mysterious understanding between themselves and the horse which links together the intelligenve of man and animal, and not only gives the one perfect control over the other, but adds much to the pleasure of riding and driving. This wonderful power is difficult to explain, and is ont trasnferable from one person to another, but its reality is undoubted.



Put in as Big a Garden as you Possibly can this Spring
—but be sure you put it in RIGHT! Thorough tilling and plenty of fertilizer are both important, but not more so than the choice of seeds. "Like produces like", and you cannot expect fine crops from inferior seeds.
Ewing's Reliable Seeds
are grown from selected plants of the very best strains. They are clean, vigorous, sure to grow—and for over Forty Years have been producing the finest gardens in Canada.
Your first step will be a wise one if you choose Ewing's Seeds. Get them from your dealer, or if he hasn't them order from us direct.

POULTRY

Early Pullets.

Remember it is the early hatched pullets that do the most fall and winter laying. In our experience in the handling of many thousands of layers the early hatched pullets always proved the greatest profit makers. They have sufficient time to fully mature and start to laying before the cold weather sets in, without being unduly forced for rapid development, which has the tendency of lowering the vitality. On the other hand, they should not be hatched too early, because in that case they frequently pass through a second moult, which places them as layers on the basis of hens. Just when to hatch them depends on the breeds. The Asiatics, namely, the Brahmas, Langshans and Cochins, should be hatched in February and March. The American English class breeds, namely, the Rocks, Reds, Wyandottes, Buckeyes and Orpingtons, should be hatched the latter part of March and in April, and a few the early part of May. The breeds of the Mediterranean class namely, the Leghorns, Minorcas, Spanish, Andalusians and Anconas should be hatched during April, May, and the beginning of June.

The early hatched cockerels can usually be disposed of very profitably on the market as broilers. The same does ont apply to the late hatches.

Liver Troubles

During the latter part of winter and early spring, annually a large number of fowls are lost, due to liver troubles in various forms. The reason this disease is more prevalent at this season is because conditions are then best for its development. Liver troubles generally are caused by overfeeding, feeding of improperly balanced rations, lack of exercise and green food. There are a large number of diseases of the liver; all more or less caused by the same remedies.

Some of the symptoms of liver diseases are: Rough plumage, watery diarrhoea, first brownish, then yellow; lack of appetite; slow and inactive in movements, purple comb, and careless disposition. Post-mortem examintaoin would show the liver enlarged and sometimes accompanied by a fatty degeneration. In the case of tuberculosis, the liver would be covered with nodules of a cheesy-like formation and appearance.

The first thing to cure or prevent this disease is to change the food and method of feeding. Feed less solid and rich albuminous foods and more light bulky foods. Guard against overfeeding. We have sometimes found it advisable to starve the birds for a day and then to feed very sparingly. Feed plenty of green foods in the form of short, succulent grass, dandelions, cabbage leaves mangels, sprouted oats and other vegetables. Make them exercise by feeding all grain fodder in the litter. Open up the exit, and give them a chance to exercise in the open. Allow free range. Keep the house and surroundings clean and disinfected. Give frequent doses of Epsom salts, and give individual doses of Epsom salts to affected individuals.

Quite frequently, especially in the spring, when the birds are laying heavily and good sized eggs, some of the best layers, more frequently pullets, in laying, force out the inside of the lower portion of the oviduct, causing the everted portions of the oviduct to project from the vent. Other hens, noticing this, soon learn to pick at it, and in this way rupture the blood veins in the same, causing the bird to die, either due to loss of blood or blood poisoning. I have known cases like this, immediately after the hen came from the nest, upon catching, and with clean hands pushing it back into the oviduct, and keeping the hen separate from the rest, to do perfectly until the next egg was laid, when the oviduct would again be everted. Since then we kill all such as soon as discovered; at this time they are perfectly good and fit for eating. This, however, is not true after this case has been allowed to run for several days. Of course minor cases of evertion of oviduct may be cured by replacing the organ and keeping the bird for a few days in a dark coop, feeding slightly, and not force for egg production. We have only been able to cure prolapsus of oviduct, when the same was only in a small degree, or in other words only a very small part of the oviduct was everted. When several inches were everted, we have found it impractical to attempt to cure it.

It is generally caused by a weakening of the muscles in the oviduct walls and in connection with abnormal or unnatural straining of these muscles when laying. Sometimes a large egg or a double yolked egg, on account of its size, makes it difficult for the muscles to eject the egg and often in so doing rupture the walls. There are other causes, but by far the most important is the straining of the rather weak muscles in the walls of the oviduct. This ailment is prevalent in the springtime because at this time the fowls are laying the heaviest. Then, too, it is at this time that a large number of pullets lay for the first time. Although the trouble appears most frequently among pullets beginning to lay, it is also found very frequently among hens.

It has been stated that feeding plenty of green food has a tendency to prevent it. Some say the feeding of raw potatoes is beneficial. We, however, doubt the usefulness of either of these for this purpose.

We are, however, positive that dark and secluded nests are a great aid in prevetning prolapsus of the oviduct. Confined birds are much more subject to it than birds on free range. Allow

Realize the Value of Your Farmyard Manure

Of course you use all your stable and stall manure—sometime or other. But does it first lose its value by leaching and firefanging?

Everything Depends on How it is Used!

Bulletin 223, issued by the Ontario Department of Agriculture, proves the importance the Department places on farmyard manure, and how it is used.

There is a book published called "Helping Mother Nature, The Value of Manure and How to Utilize It." It's a revelation of how much a farmer can add each year to his profits. It will help every farmer who reads it. We have reprinted it (six chapters) for FREE distribution.

First thing you do, cut out the coupon below, fill in your name and address and mail to us. By return of mail you will receive a copy of the book that will make you see manure in a new and profitable light.

SISTER: READ MY FREE OFFER.

I am a woman.
I know a woman's trials.
I know her need of sympathy and help.

If you, my sister, are unhappy because of ill-health, and feel unfit for household duties, social pleasures, or daily employment, write and tell me just how you suffer, and ask for my **free** ten days' trial of a **home treatment** suited to your needs; with references to Canadian ladies who gladly tell how they have regained health, strength, and happiness by its use. I want to tell you all about this successful method of home treatment for yourself, my reader, for your daughter, your sister, or your mother. I want to tell you how to cure yourselves at home at trifling cost, and without aid from anyone. Men **cannot** understand women's sufferings; what we women know **from experience,** we know better than any doctor; and thousands have proved there is **hope** even **for the hopeless** in my method of home treatment. **If you suffer from pain in the head, back, or bowels, feeling of weight and dragging down sensations, falling or displacement of internal organs, bladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly or irregularly, bloating or unnatural enlargements, catarrhal conditions, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living, I invite you** to send to-day for my complete **ten days' treatment** entirely **free and postpaid,** to prove to yourself that these ailments can be easily and surely conquered at your own home, without the expense of hospital treatment, or the dangers of an operation. Women everywhere are escaping the surgeon's knife by knowing of my simple method of home treatment, and **when you are cured,** my sister, I shall only ask you to pass the good word along to some other sufferer. My home treatment is for all,—**young or old.** To **Mothers** of **Daughters,** I will explain a simple home treatment which speedily and effectually cures green-sickness (chlorosis), irregularities, headaches, and lassitude in young women, and restores them to plumpness and health. Tell me if you are worried about your daughter. Remember **it costs you nothing** to give my method of home treatment a complete ten day's trial, and if you wish to continue, it costs only a few cents a week to do so, and it does not interfere with one's daily work. **Is health worth asking for?** Then accept my generous offer, **write for the free treatment** suited to your needs, and I will send it in plain wrapper by return mail. To save time you can cut out this offer, mark the places that tell your feelings, and return to me. **Write and ask** for the **free treatment to-day,** as you may not see this offer again. Address:

MRS. M. SUMMERS . BOX 309, WINDSOR, ONTARIO

Your Child May Have Worms

Keep a watchful eye on your child's health. Above all guard against worms. Familiar symptoms of worms in children are: Deranged stomach, furred tongue, belching, variable appetite, increased thirst, acid or heavy breath, nausea, enlarged abdomen, costiveness, pale face of leaden tint, bluish rings around eyes, itching of nostrils, languor, irritability disturbed sleep, grinding of teeth, irregularity of pulse.

Trade Mark

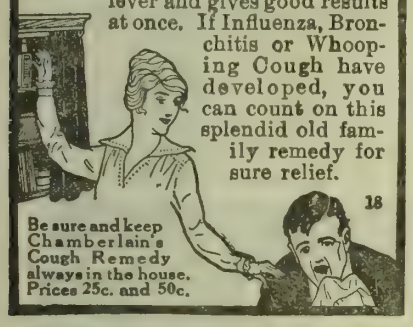
Grown folks are subject to worms also.

The one best remedy is Dr. True's Elixir, the Family Laxative and Worm Expeller. First sold in 1851—today it has a world-wide reputation. Good for adults also. Get a bottle today—at your dealer's; 35c. 50c and $1.00. Advice free. Special treatment for tapeworms. Send for book.

Knowlton, Que. Dr. True

CHAMBERLAIN'S COUGH REMEDY

You can ward off many anxious moments if, at the first sign of a Cough or Cold, you will use Chamberlain's Cough Remedy. It loosens the phlegm, it heals the sore throat and bronchial tissues, allays fever and gives good results at once. If Influenza, Bronchitis or Whooping Cough have developed, you can count on this splendid old family remedy for sure relief.



PILES CURED at HOME by NEW Absorption Method.

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money but tell others of this offer. Write today to Mrs. M. Summers, Box P. 309 Windsor, Ont.

ADVERTISE IN THE MARITIME FARMER TO GET RESULTS.

your birds unrestricted range, and separate al lsuch as have a tendency to evert the oviduct while laying, from the rest of the folck. Sometimes only a very little eversion causes the other birds to pick at the same, and thus prove fatal. Do not feed too heavily of animal food, as the same has the tendency to increase the size of the eggs to some extent.

Egg Eating

Egg eating is a vice or bad habit very prevalent in spring. It is generally caused by lack of oyster shell, exercise, green foods and close confinement. To prevent this vice, provide oyster shell in a self-feeding hopper always before them. Feed green food. Allow fowls unrestricted range and make them exercise for their living in a deep, loose, dry litter. Quite frequently the nests are a factor in the furthering of this bad habit, especially when constructed of lumber for the bottom and located in very much frequented places. We endeavor to locate all of our nests in dark and secluded places several feet up from the floor. We prefer quarter-inch mesh galvanized hardware cloth for the bottom instead of boards. We keep a liberal supply of nesting material in the nests. We provide a sufficient number of nests so constructed that the hens can step into them and do not have to jump into them. We make it a practice to gather the eggs frequently. We separate such individuals as appear to have an exceptional liking for eggs. We are particular to darken the nests as much as possible. Some people recommend bits to fit over beak in such a way as to prevent their breaking eggs. Others recommend nests with fake bottoms, causing the egg to slip out of the reach of the birds as soon as it is laid, through a hole in the bottom of the nest. In practice, however, it is more satisfactory ot try to prevent the habit instead of curing it.

A Substitute for Wheat

The high price of wheat is causing a large number of poultry men to look around for a substitute. Can we find a substitute? No, we cannot find a perfect substitute for wheat in the feeding of poultry, because wheat is the best single grain for poultry; it is well balanced and relished. Although wheat is an exceptionally good grain for poultry, its present high price makes it impossible to feed it at a profit. Barley may be substituted, but it is not quite as satisfactory nor as well relished. Heavy oats may be substituted, but is inferior to wheat on account of of its excessive fibre in the hulls, which is largely indigestible. Peas, especially the Canadian variety, makes an excellent chicken feed, and is excellent feed for laying hens or growing chicks. A grain mixture as follows: 50 lbs. corn, 20 lbs. Canadian field peas and 30 lbs. barley or heavy oats, we find very satisfactory.

Get Incubator Ready.

If you have an incubator get it out from its storage place and give it a thorough cleaning. See that la[illegible] are working all right. Burners should be replaced with new ones whenever there is any doubt as to their being in perfect working order. New wicks should be ordered and a supply kept on hand. Thermostadts should be tested and the tanks, if hot water machines, tested for leaks. If hot air, the machine should be run a few days and tested as to its ability to retain proper temperature. Egg trays should be gathered up and all given a thorough washing in strong soap suds and dried before a warm fire. Chick trays all should be covered with new cloth. The body of the machine should be washed out thoroughly with strong soap suds, using a scrubbing brush to get into the corners and crevices.

Give me a chance to PROVE my flour

I WANT folks to know what a splendid flour Cream of the West is. I want you to buy a bag at your grocery store. Use it for a couple of bakings and see the result.

Cream of the West Flour

the hard wheat flour guaranteed for bread

With Cream of the West you will have success or your money back. Your bread will do you credit or you don't pay one cent for the flour. Send back what you have left in the bag and your money will be refunded in full.

A strong, nutritious, light-rising, guaranteed flour, unbeatable for bread. That's Cream of the West. Try it.

Queen City Flour. This is a blend of Ontario and Western wheat. It is a splendid all-round flour for all bread and pastry purposes.

Monarch Pastry Flour is milled from Ontario soft wheat exclusively for pastry purposes. As good for pastry as Cream of the West is for bread.

Farmers' Clubs are invited to write us for quotations on flour, cereals and feed. We are supplying many such clubs satisfactorily.

Two on a Rancho

(By Brevard Mays Connor)

The first moment he saw her, he disliked her violently. He scowled at her as she descended from the station bus in front of the sanatorium, and sank weakly into the one vacant chair under the rusty catalpas. She should have known that those chairs were placed there especially for the men, and he had been just on the point of taking that seat himself.

When she coughed and leaned back wearily, he sneered. His own cough was deeper than hers, his hands more bony, his skin more fever-flushed and transparent; so he felt no pity, only a rush of rage that she should so openly advertise her weakness.

Then she slowly turned her head, and the pale-blue eyes widened with interest as they took him in. He knew she was recognizing those unmistakable signs that hung like shadows over herself, and he resented it with all the feeble rage of the very ill. He was just on the point of going over and demanding the chair when she stood up, and throwing him a smile of sad understanding, moved slowly into the building.

All afternoon he sat there under the catalpas and frowned at the drowsing plaza. It had been a most unpleasant day even from early morning, when that old, tottering, white-haired Ananias had buttonholed him and, gloating, had boasted that the doctors gave him only three weeks more.

Gordon Barlow's doctors had given him six months; and the contemplation of the shortness of his remaining terrestrial stay, even though a morbid one, was the only pleasure that remained. People always shuddeerd when he told them. And now this old man came vaunting his three weeks! It was disgusting, the way some people were always flinging their troubles in the very faces of chance acquaintances.

A dog, a disreputable pariah of the streets, his every rib visible, and his meek tail between his legs, slunk up and lay at Barlow's feet.

'Get away, you beast!" he snarled, thrusting the creature off with his cane.

The very dogs were like the people, airing their misery everywhere. He would get out of the place; it was too crowded, and the climate was abominable. He swore at the heat none the less vehemently because under his breath.

It was hot! Although it was late September, and palms in the plaza drooped under the relentless sun, and the paved streets smoked dizzily. He would go somewhere, anywhere—it didn't matter where, when there was only six months more.

"Get!" he snarled and waved his cane at the sad-eyed cur, which had returned and was gazing wistfully at the patch of shade alongside his chair.

There was a soft cough behind him.

"Oh, please don't hurt him!"

It was a husky voice—a woman's. He was sure it was she, before he turned.

"Is it your dog?" he demanded, glaring into the faded blue eyes.

"No, it's not mine," she said.

"I think you'd be ashamed to admit it if it was."

She did not seem to take offence, but came and sat in the next chair, which was now vacant.

"I wish he was my dog!" she whispered huskily, cupping her chin in her palms.

"What would you want with a beast like that?"

He waved his cane at the intruder again.

"He'd be mine," she replied simply, and as if the sequence was perfectly natural. "You see, I've never had a dog, or anything like that."

'Humph!" he snorted, suspicious of sentiment. "That's just like a woman, always wanting something she has n' use for. As for me, I don't care if I never have anything else. What good would it do me, when I've only six months to live?"

He watched her covertly, triumphantly.

"That's just how loing they gave me," she replied listlessly.

He was on his feet in an instant.

"I don't believe it! You look strong—much stronger than I do. Why—why, you'll live years yet!"

Trailing off into a sputter, he stumped off, fuming.

He had hoped to hurt her, or at least to surprise her, but she didn't even raise her eyes as he left—he looked back to see—and this made him more angry than ever. Indeed, he was so angry that he walked entirely round the plaza without stopping—which was very foolish, for afterwards, when his rage cooled down, he was so tired tht he had to take to his bed.

He told her of this proof of his weakness when they met again that night, and he was hardly able to restrain his glee in the telling. The front porch and the chairs under the catalpas were crowded, so he led her over to a bench on the plaza, poohpoohing her listless objections.

"Night air? Bosh! Night air can't make or break us now! So what's the difference? Besides, we'd be bored to death with that bunch."

Above, the sky was so clear that the myriad stars were reflected in the little pools left by the watering-carts. A hot breeze, stealing from the south, brought with it the faint crack of rifles, and now and then the heavier boom of cannon, marking the last desperate stand of the insurrectos. She listened attentively, for it was still new to her.

"Doesn't it seem awful for healthy people to pant to kill one another?" she whispered, as if awed.

All his bitterness welled up in a sudden, poignant cry.

"A healthy man! Just think what a healthy man, a strong man, can do!" He wrenched his hands until the knuckles gleamed white in the glare of the arc-light, while his dark, feverbrightened eyes glowed like twin coals beneath his heavy knitted brows. "Just think of being able to plan things, and to know that you will have the strength to carry them out! There were so many things I had dreamed of doing, so many things—"

Across the river there was a sudden outburst of firing, which died away as quickly. In the shrubbery behind, a girl laughed. The woman shivered.

"Are you cold?" he asked.

"No, no, not cold!" With a little trembling cry of relief, she added: "Oh, look, there is our dog! I believe he knows us. Here, boy!"

At the snap of her fingers the cur came forward, wagging his tail with open-hearted camaraderie. She opened her hand-bag and took out a little package, which, unrolled, proved ot be a bit of bread and meat. Greedily the dog snapped it from her fingers.

Shame, sir!" she cried. "a w,'xwqx'

"Shame sir, she chided. "You have no maners. Now if you were my dog—I wish you were my dog!"

"You'd soon find out what fleas were," snapped Barlow. "I'm going to take my good night constitutional. Good-bye!"

II.

Gordon Barlow was naturally abrupt, but in this case his hasty departure was due to pure fright. He had always fled from the tender tone, and the softer view of life, even before the shadow had fallen upon him and soured what had been naturally sweet. Life had always appeared to him as a battle wherein achievement had to be carved out with all one's unresting strength. The height of human happiness, to his mind, was seeking to achieve by means of the fiercest struggle of which he was capable.

He had been educated for an engineer, had dreamed of taking rugged nature and making it plastic to his will; but where his strong spirit longed to build, his frail flesh betrayed him, and so he cast his dreams away and laughed at them cynically.

But this cynicism, this delight in his hopeless condition, was only a mask which pride made imeprative. Beneath, the fire burned all the more fiercely for the darkness which enshrouded him. This woman's weariness, her lack of energy, her passive acecptance of the inevitable, irritated him.

That, in turn, made him wonder why he should care enough about such an inconsequential person to be irritated. He believed in the doll theory concerning women—that they were valuable in proportion to their physical attractiveness; and this woman lacked entirely the color and curves and bloom that were his conception of feminine assets.

This thought evidently sobered him, for this time he made the circuit of the plaza much more leisurely and sanely. Several times he stopped beneath the blazing arc-lights to read the moving-picture lithographs. His sluggist blood quickened to the lively tunes of the automatic piano.

Once he glanced back at the group of soldiers elbowing their way along, carefree in their surety of health. He smiled to himself. He knew the futility of that suerty. It had once possessed him; and he turned back with a pang that they should waste with such abandon moments that could be so precious to one who could really make some use of them.

As he was strolling slowly back toward the sanitarium, his head bent forward on his breast, a hand touched his arm.

"'Ello, senor, you been in El Paso long, si? I did not know."

Barlow found himself looking down into the swarthy face of one of our neighbors across the border.

"What are you doing here, Miguel?" he asked in surprise.

The Mexican shrugged his shoulders mournfully.

"My mother's sister's husband, he was sick. We bury him today.' Miguel put away the sorrows of the world with another shrug, and looked up with a charming, white-toothed smile. "Senor will go out to the rancho, si?"

The sight of this man had brought to Barlow's mind a long-forgotten piece of property. It was an inheritance from an uncle who had an inexplicable liking for the fastnesses of northwestern Mexico. Its present possessor had only once been persuaded to visit it.

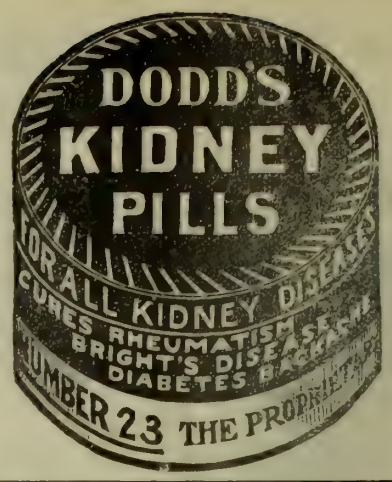
His rancho! He remembered it as a wild, inaccessible place amid barren hills, which he had rejoiced to leave; but now the sound of the words vaguely appealed to him. He had said that he wanted to leave El Paso. Well, here was just what he was looking for.

"I am at the Sanitarium Alfores, Miguel," he said abruptly. "Come the day after tomorrow, and I will go to the rancho with you."

Miguel bowed his delight, while his eyes narrowed with a world of good-natured understanding.

"And senor will take a—a leddy?"

Barlow glanced at him sharply. Then he remembered. This had been one of the avuncular failings.



HUSBAND SAVED HIS WIFE

Stopped Most Terrible Suffering by Getting Her Lydia E. Pinkham's Vegetable Compound.

Denison, Texas. — "After my little girl was born two years ago I began suffering with female trouble and could hardly do my work. I was very nervous but just kept dragging on until last summer when I got where I could not do my work. I would have a chill every day and hot flashes and dizzy spells and my head would almost burst. I got where I was almost a walking skeleton and life was a burden to me until one day my husband's stepsister told my husband if he did not do something for me I would not last long and told him to get your medicine. So he got Lydia E. Pinkham's Vegetable Compound for me, and after taking the first three doses I began to improve. I continued its use, and I have never had any female trouble since. I feel that I owe my life to you and your remedies. They did for me what doctors could not do and I will always praise it wherever I go."—Mrs. G. O. Lowery, 419 W. Monterey Street, Denison, Texas.

If you are suffering from any form of female ills, get a bottle of Lydia E. Pinkham's Vegetable Compound, and commence the treatment without delay.

BETTER THAN SPANKING

Spanking does not cure children of bedwetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W. 309, Windsor, Ont., will send free to any mother her successful home treatment, with full instructions. Send no money but write her to-day if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.

Dept. [illegible] 257 College St. - Toronto
(*Also at Leicester, England*)

Minard's Liniment Co., Limited,

Gentlemen,—My daughter, 13 years old, was thrown from a sleigh and injured her elbow so badly it remained stiff and very painful for three years. Four bottles of MINARD'S LINIMENT completely cured her and she has not been troubled for two years.

Yours truly,
St. Joseph, P.O., 18th Aug., 1900.

"Senor will not take a lady!" he snapped, and turned away, while Miguel bowed his apology.

The girl was still sitting where he had left her, with the dog curled up at her feet, fast asleep. Triumphantly he told of his plans to leave, of Miguel and the rancho, and the wild mountains and stretches of uninhabited country. Her dull eyes brightened for a moment.

"It must be wonderful out there! I've never been able to get out into the country, and I've always wanted to make things grow. I had a geranium in a pot at the hospital, but a little girl loved it so much that we—we buried it in her arms." His snort was poorly concealed, and she turned quickly, abashed. "But won't it be lonely out there, and dangerous, with all the fighting going on.

"I want it to be lonely," he said, biting his nails. "And as for the fighting"—he touched his breast—"I carry a passport here that people respect. I won't be entirely alone, anyhow. There are Miguel and his wife."

The cur awoke sudednly, and industriously sought the cause of his disturbance with a hind leg.

"Why don't you take a dog?" she asked.

"I wouldn't have a dog!" he almost shouted, and went to bed.

III.

She didn't appear until very late the next day, Barlow, who had wandered about restlessly, with the germ of an idea working in his brain, greeted her coldly, as if she had failed him personally.

"I was so weak," she explained, "I just couldn't get up."

He grunted.

"But I watched you from the window," she went on. "I saw you feed our dog."

"Is that a criminal act?" he shot back testily, and glowered at the beast who lay at his fete watching him with eyes filled with adoration. "Why do you call him our dog? He probably belongs to somebody, and you are liable to get in trouble if you try to claim him."

She turned eyes sudednly tear-filled upon him.

"Oh, do you think so? Do you really think I couldn't have him? I've never had a dog!"

"So you have told me several times," he retorted cruelly, and fell into silence, biting his under lip fiercely.

The germ of an idea was full-born. He was thinking it over.

He had to admit that it was an astounding idea, but when he came to voice it he did so calmly and judiciously.

"I've decided that it will be lonely on the rancho with only those two Mexicans for company. I should probably get very morose and morbid and unhappy, and I wouldn't like to feel that way up to the end. So I've decided that I want to take—"

"The dog?" she questioned breathlessly.

"No, not the dog. I want to take you."

She studied him for a long while in a sort of dull wonder.

'Don't be conventional," he cried, "and ask what people would say! We won't give them a chance to say anything. We'll get married before we start. Don't misunderstand me. This is an affair entirely of convenience; there is no sentiment in it, on either side. I would prefer not to have people talk, for my family's sake; for my own I don't care a cent. We are too near the edge of the world to be bothered personally about the world's laws. All this is at our backs."

She was running her pale-veined hands through the dog's hair.

"How do you know that my being out there will make you happier?"

That was getting too near the path of sentiment that he so rigorously avoided, so he set her right again, clearly, cruelly.

"Neither you nor anybody else has the power to make me happy. I chose to ask you because your going seems more convenient. There isn't much else that you can do, and you have already said you would like to get out in the country and—and make things grow. Well, you would probably be much happier there than here and you would help me by keeping my mind off myself, more or less. And don't say that I don't know anything about you, or what you used to be, or whether you are low-born or high-born. I am not marrying you for a wife, you understand, and so all those things could have no effect. My nurse told me that your name is Jane Robertson, and that you used to work in a hospital. The last is superfluous, but I needed to know your name to have it put on the license. Kindly be ready in the parlor at ten o'clock tomorrow morning. It has to be early, so that we can make our train. Now I'm going to take my walk!"

She looked up with a pleading smile.

"Could—could I take the dog?"

He frowned at the sudedn little rush of heat that warmed his heart.

"Of course! Take a whole pack, if you wish!"

"Oh!" she breathed gratefully, pressing the cur's head against her knees. "Oh, thanks!"

He grumbled to himself all the way around the plaza.

A Good Roast from Tough Cut.

An excellent roast may be made from a very tough cut of beef by the following method:

Select a thick cut of the lower round or any other portion that is without bone (this should be 3 or 4 inches thick). Pound flour into the meat on both sides (about 1½ cups of flour can be pounded into a 3 or 4 pound piece). The pounding breaks up the fibre and the flour retains the juices. Sear the meat all over and place in a roaster. Pour the contents of a can of tomatoes over the meat. Onions and other seasonings may be added. This makes a tender roast and excellent gravy. It also is very good when sliced cold.

When the Back Becomes Lame

IT IS A SIGN OF KIDNEY TROUBLE

Doan's Kidney Pills cure the aching back by curing the aching kidneys beneath—for it is really the kidneys aching and not the back.

Doan's Kidney Pills are a special kidney and bladder medicine for the cure of all kidney troubles.

Mrs. Louisa Gomshaw, 683 Manning Ave., Toronto, Ont., writes: "I take great pleasure in writing you, stating the benefit I have received by using Doan's Kidney Pills. About three years ago I was terribly afflicted with lame back, and was so bad I could not even sweep the floor. I was advised to try your pills, and before I had used one box there was a great improvement, and my back was much better. However, I kept on taking them until my back was completely cured. I highly recommend 'Doan's' for lame back."

Doan's Kidney Pills are the original pill for the kidneys. See that our trade mark the "Maple Leaf" appears on the wrapper.

Doan's Kidney Pills are 50c per box, 3 boxes for $1.25; at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

When ordering direct specify "Doan's."

Nourishing School Lunches.

Hardly too much can be written or said on the subject of school lunches. We all know school children need nourishing food but some way it is easier for so many to stick anything which is at hand into the boys' and girl's lunch pails the last minute instead of using a little forethought. Oftentimes it chiefly consists of pie and cake because those are articles handiest. Where it is possible in the home, the main meal should be at night, during the school year, so the children may be sure of at least one hot nourishing meal aday.

Whatever kind of receptacle is chosen for carrying the lunch, choose one fairly good sized. The fibre boxes are apt to retain odors, wicker ones let the food dry, so tin seems about the best all-around material. Waxed paper is cheap and will keep the lunch dainty and appetizing; jelly cups with covers are convenient to hold food which is moist and hard to pack. If your pocketbook will permit it a bottle which keeps liquids either hot or cold, as you choose, should be included in the outfit.

Every lunch should have some substantial food like sandwiches, some succulent food like fruit, fresh or canned, lettuce, or tomatoes and a dessert, which may be cake, candy, nuts and raisins, cookies or pudding.

Sandwiches may be varied, first by using different kinds of bread, white, brown, graham, rye, nut, raisin, etc., and secondly by different fillings. The latter are innumerable.

All kinds of meat, which may be sliced, chopped or ground and softeden with cream or salad dressing; fish, as sardines or salmon; eggs, boiled, sliced and seasoned, fried or chopp.d and moistened with salad dressing; all kinds of cheese; lettuce and cress in season; jellies, jams, fig paste and raisins; peanut butter and baked beans make good fillings. A sandwich should always be made neatly of thinly sliced bread. The fololwing are excellent recipes:

Egg Filling—Three eggs, hard boiled and chopped fine or ground; an equal amount of chopped or ground boiled ham, salad dressing, mix and spread.

Raisin Filling—One cup raisins ground or chopped, one-half cup water, one-half cup sugar, one tablespoon flour moistened with vinegar, juice and grated rind of one lemon, cook in a double boiler until thick.

Egg Filling—Scrambled egg with crisp bacon.

Chicken Sandwich Filling.—Chop cold boiled chicken, and moisten with salad dressing; or season with salt and pepper and moisten with rich chicken stock. Chopped cold boiled chicken and ham, mixed with creamed butter, makes a delicious filling.

Club Sandwiches — Arrange on slices of bread (toasted or untoasted) thin slices of cooked bacon; cover with slices or roast chicken and cover chicken with salad dressing. Place a slice of bread on top.

Tomtao Sandwich Filling.—One quart can of tomatoes boiled down to one cup, one-half pound American cheese and one-half pound dried beef, ground together. Mix and add salt and pepper, boil to desired thickness for spreading. When cool, beat in one egg.

Plain bread and butter with sliced meat or deviled eggs is relished. Celery, radishes and occasionally a small amount of pickle may be added to the lunch.

All kinds of fruit are good, particularly the fresh. If preserves are used, it is well to put them in one of the half pint preserve jars as there is less danger of spilling than in a jelly cup. Many kinds of pudding may be put in a jar of that kind and are a change. Cup custards can be sent in the cup they are baked in.

A few nut meats, dates, figs, raisins always liked by children and are very nutritious.

Time and care spent on your child's lunch are time and care well spent. No engineer expects his engine to do its best unless it has plenty of coal and coal of a suitable kind. The same is true of your child's body. Nutritious food to make good rich blood is a neccesity if physical health and good work in school are desired.

The Value of a Smile.

I heard the other day of the failure of a business man. It came as a surprise to everyone, for his store was one patronized by the rich and he was supopsed to be making money. Among the conjectures as to the cause of his failure this one was expressed:

"He never smiled. Haven't you ever noticed it? A customer would go in the store and he would greet them with a face that said plainer than words: 'Joy is dead, didn't you know it?' I never left his place without a queer, uncanny feeling following me, and wondering what on earth was the matter with him and I tell you I never went there oftener than I had to."

We have all experienced it, the depressing sensation following intercourse with a negative person, and then how pleasant and joyous to meet with the one "who wears a smile." It need not be the senseless grin which means nothing. I have known both men and women who smiled with their lips, but whose eyes were as cold and chilling as steel points. It is the person who radiates good cheer, whose every act seems to express that life is good, and that joy awaits everywhere and in everything if we but look for it. It is not necessary to wear a pair of poor Sam Weller's "patent double mill liom glass microscopes of hexrta power," either, to find this joy. I once knew a man who was the very soul of goodness, and who everyone that knew him loved. He did not smile often, indeed, his face was rather serious, for he was a deep thinker, but his eyes* Why, they danced hornpipes with appreciation of any and everything good and lovely and he saw beauty in all things, from the life of a little insect in the path at his feet, in the .blue of the sky, or the song of a bird.

A cheerful visage in the morning, eager to meet the day's duties and problems, must shed its beneficent influence over everyone with whom we have to to, inspiring and encouraging them to do their best also. With this thought to follow us, how light our own difficulties and trials will appear, for after all it is goodness and love that really control the world, if we only make that rule appear in our own lives.

MAGIC BAKING POWDER
Magic Baking Powder costs no more than the ordinary kinds. For economy, buy the one pound tins.

A cheerful visage in the morning, eager to meet the day's duties and problems, must shed its beneficient influence over everyone with whom we have to do, inspiring and encouraging them to do their best also. With this thought to follow us, how light our own difficulties and trials will appear, for after all it is goodness and love that really control the world, if we only make that rule appear in our own lives.

Smile a little, smile a little
Do your very best:
Surely all things, good and lovely
Come at your behest.

A SERIOUS ERROR

"You've made a serious mistake in your paper," said the indignant man, entering the editorial sanctum. "I was one of the competitors at the athletic match yesterday and you have called me the well known lightweight champion."

"Well, aren't you?" said the editor.

"No; I'm nothing of the kind; and it's confoundedly awkward, because, you see, I'm a coal merchant."

STRAWBERRY PLANTS!

Growers of Strawberries in the Maritime Provinces receive fifty per cent. more for their fruit than farmers in Ontario. Our soil is just as suitable, our climate just as favorable for big crops as theirs. No one should talk of hard times who is not living up to his opportunities.

In berry growing good soil, good care and cultivation and good plants are all the essentials of success; but as the stream cannot rise higher than its source, so without first-class well grown plants good returns for labor cannot be expected. We can prove by many satisfied customers that the grower who buys plants from us is starting on the right road for a big berry crop.

We offer the Senator Dunlap, the most widely grown and popular berry in America at $3.50 a thousand. In orders of five thousand or over, $3.25 a thousand. We have also Arnout, Williams, Valeria, etc , the old standbys and the best new kinds.

Send for descriptive Catalogue and Price List, it's FREE.

CYRUS & MANNING ELLS, - Port Williams, Nova Scotia

The Syrup of a Hundred Uses

Of course, "Crown Brand" is your favorité Table Syrup. Of course, you enjoy its delicious, appetizing flavor with *Bread, Pancakes and Hot Biscuits.*

But what about "Crown Brand" in the kitchen? Do you use

EDWARDSBURG "CROWN BRAND" CORN SYRUP

for Gingerbread, Cookies, Cakes, Pies and Sweet Sauces for all kinds of Puddings?

Do you always use it for *Candy-making*?

Try it in all these ways. You'll find "Crown Brand" Corn Syrup handy, convenient, economical, dependable, good.

"LILY WHITE" is just what its name implies—a clear corn syrup—more delicate in flavor than "Crown Brand", that is equally good for the table and for candy-making.

ASK YOUR GROCER—IN 2, 5, 10 AND 20 POUND TINS.

The Canada Starch Co. Limited, Montreal.

Results Of Good Seed.

(By F. C. Nunnick, Agriculturist, Commisison of Conservation.)

During the past three years the Commission of Conservation has conducted illustration work on a number of farms in Canada. The question of good seed and seed selection has received particular attention. From the reports of twenty-three of the farmers who have been doing illustration work in the five Eastern Provinces many valuable facts have been secured.

Sixteen of the men stated that they had not previously been sowing the varieties and strains of grain on their farms to give best results and eighteen say they are now sowing varieties which are more suitable to them and their neighborhood.

Only three claim to have been sowing selected seed before beginning work with the Commission, while now every man is sowing selected or registered seed and states that it pays him in bigger and better crops. All of the men say that good seed has become something of much greater importance to them than previously. This is something which cannot fail to have lasting and far-reaching results in each community.

The following are extracts from the letters received from the farmers themselves:

Nelson Peterson, Kingston, Ont.: "Three years ago, I thought I was sowing good seed; now I find it pays to sow the best that can be had."

George R. Barrie, Galt, Ont.: "As to Indian corn: It is cheaper to pay $10 per bushel for good kilndried corn than to sow the shelled corn that is sold in the stores. Two acres sown with selected corn purchased on the cub, costing $2.50 to $3.00 per bushel gave almost twice as much weight of ensilage as two acres sown with shelled corn in sacks and costing about $1.50 per bushel."

W. T. Hands, Perth, Ont.: "We have not changed varieties of seed, but we are now sowing nothing but registered seed. We find we have better results and that it pays. Last spring we sold about 400 bushels of oats at $1.25 per bushel and 200 bushels of barley at $1.00 and $1.25 per bushel."

Whittiker Bros., Williamsburg, Ont.: "The tests with corn have proven to us that it is cheapest to buy the best seed corn possible; it matters not what the price may be."

Chester H. Keith, Corn Hill, N.B.: "I am now sowing the best seed whereas I used to sow seed of inferior quality. This is one way the Commission of Conservation has helped, not only me, but a number of neighbors, in obtaining good seed grain."

Taylor Bros., Antigonish, N.S.: "We have been sowing selected seed for the past eight or ten years; on the average our yields have been a full 50 per cent greater than they were before."

Cuba And Canada.

These two ambitious nations, one leading the world in the production of sugar and the other in the production of wheat, should be better acquainted with each other. These two young countries, Canada as at present constituted, not yet fifty years old; and Cuba as a republic less than twenty; not satisfied with leading the world in the production of sugar and wheat, are running very close in the endeavor to lead the world in the amount of trade per head, Canada showing an annual export and import trade of $140.00 per head of population and Cuba slightly in advance, showing $145 per head.

We should know each other better commercially; as nearly all the products of Cuba, viz.: sugar, tobacco and tropical fruits, Canada needs to buy; while nearly all the products of Canada, viz.: lumber, paper, coal, iron, steel, machinery, cement, fish, hay, oats flour potatoes, butter, cheese, eggs, canned meats, vegetables and fruits, Cuba needs to buy; and because the products of these two countries are so entirely different, their trade with each other would be greatly to the advantage of both.

We should be better acquainted socially. It would be well if the people of these two countries knew each other better. Canada has many attractions that would appeal to the people of Cuba. To the sportsmen the hunting and fishing of Canada, which are unexcelled, would be the chief attraction. To others the attractions of our Canadian winter would appeal, with its skating, snowshoeing, sleighing and tobogganing. To others our beautiful rivers, lakes, mountains and valleys would be a never-ending delight and, once seen and enjoyed, there would always be a desire to visit them again. On the other hand, I do not know of any trip a Canadian could take that would be as enjoyable as a trip to Cuba, especially during our Canadian winter. The principal charm of the visit would be that he will find everything different to what he is accustomed. The country and its products are different. The climate is different, as he will find perpetual summer here. The customs, language and disposition of the people are different from our own. The fruits, plants, trees, flowers and birds are different. The houses, streets and markets are different and the street scenes, with its mixture of ancient and modern, will be a source of never-ending wonder to the Canadian visitor, and a visit to the country where you are never out of sight of the palm trees wherever you travel in Cuba, is something never to be forgotten. A person from the north who spends a few months in Cuba and enjoys the hospitality of its people, always plans to return again at some future time.

(Signed) J. C. MANZER,
Commercial Representative in Cuba for the Government of New Brunswick. Lonja No. 203, P.O. Box 1290, Havana, Cuba.

Cuban Sugar Prospect.

Cuba's sugar mills, or Centrals, as they are called here, are busily engaged in grinding the largest crop of sugar cane ever produced on the Island. As the result of the high prices which have prevailed for the last eighteen months, the acreage has been largely increased. A. A. Himely, Cuban representative for the Federal Sugar Refinery of New York, considered to be the best posted man in Cuba on the sugar situation, estimates the 1916 sugar crop at 3,175,429 long tons, or about 22,214,000 socks.

To handle this immense quantity of sugar will require over 1,200 steamers of an average capacity of 18,000 sacks each. At the prevailing prices. which are about 3¾ cents per pound, f.o.b. steamer, the crop will be worth $266,568,000 or an average of over $100.00 for every man, woman and child on the island. This will be an increase of over $100,000,000 in the value of this year's sugar crop over the crop of 1914.

Profits from the Deering Disk

Deering Tillage Tools

THERE is more than one good reason why so many farmers use **Deering** disk harrows and other **Deering** tillage implements, but all those reasons can be summed up in one word—Profits.

There is profit in disking some fields before plowing.
There is profit in a well-disked seed bed for grain.
There is profit in making surface mulch to conserve moisture.

The fact that these profits show only at marketing time, takes nothing from the credit of the **Deering** disk harrow which is really responsible for them. The **Deering** disk, with its bowed set-lever bars, its easily adjustable snubbing blocks, and its direct, right-angle pull on the bearings, does the work that finally results in a heavier stand of better grain, which sells at a higher price and better profit, than if the **Deering** disk had not been properly used.

Think it over and buy your tillage implements from the **Deering** local agent for this spring's work. Quality counts, and quality runs through the whole **Deering** line of disks, peg and spring-tooth harrows, cultivators, scufflers and land rollers. Write us at the nearest branch house for catalogues but do not fail to see the **Deering** tillage line before you buy.

RED ROSE TEA "is good tea"

Dietetics and Properly Balanced Menus

Food is anything which nourishes the body, it is necessary for growth, repair and energy. Therefore the elements composing the body must be found in the food. Food is classified as follows:

Organic

Proteid—Gives muscular tissue.

Carbohydrates, fats and oils—Oxitized to give heat and energy.

Inorganic

Mineral matter and water.

We all know the pleasant sensation given by a satisfactory meal; it comes from the perfect adaptation of the foods to the needs of the system. If food was always selected, prepared and combined to conform to our bodily needs, we should be, barring accidents perfectly nourished, healthy creatures. But imagine a mother saying each time she started to prepare a meal: "So much carbohydrates for John, and half as much proteid as fat for pa." Mothers, think they have enough to do to cook a wholesome well balanced meal for the family without this. Yet those families who labor find that certain foods have the power to sustain muscular vigor even though they do not reason out why soup always comes first at a dinner and dessert last. Everyone knows this is the most practical knowledge, but more and more women are inclining to learn reasons why.

To know how winter fare should vary from summer diet, how to brace the body to endure fatigue. or to repair wasted nerve forces through the diet, and when to urge the children to indulge in toothsome goodies is a woman's business.

A good place to review our daily food is at the breakfast table; if twelve hours have elapsed since the last meal and there are before us five hours of vigorous exercise and work, it is as plain as anything can be that this meal should be refreshing, strengthening and yet so light that it will not overload the stomach and dull the brain. "Milk, meat and eggs are the best muscle builders and strength producers with cereals and fruit, they give a well balanced diet. So eggs or bacon, with coffee containing cream and sugar, a cereal, bread and a baked apple would constitute a good breakfast in every sense. We have found that proteids, fats, starch, sugar, mineral salts and acids are all out diet contains, if we reduce it to its simplest elements and the following table will show what foods contain these nutrients.

Foods rich in sugar, carrots, beets, fruits, honey, syrups and sugar. Starch is found in all cereals, potatoes, etc., and this starch is changed into sugar, partially by cooking and then more completely changed after taken into the body.

Proteid is in nuts, meat, milk, and its products, eggs and in legumes.

Fat, our most highly concentrated food, is found in cheese, cream, butter, meat and oils. The most valuable pure fats are olive oil and nut oils; starved nerves, thin blood, and wasted flesh thrive upon them, they are purifying and healing. Summer or winter this pure fat may be taken in salads or some other form and the family kept in health with it.

The simplest and most powerful agent in determining the character of our food is the climate. In cold regions man requires such food as not only supplies him with nutriment, but also with heat, such as oil, butter, fat, sugar and other substances in which carbonaceous elements predominate. In warm countries, on the contrary, it is one of the most essential conditions of good health that the food should be as little heating as possible. In our own climate this law holds good, as between summer and winter; in the latter season plenty of meat, butter, potatoes, sugar and similar foods are necessary to keep the body in working order, while in summer the diet should consist chiefly of those substances of which flesh forming elements compose the largest part. There is probably no other cause so fruitful in producing dyspepsia and similar diseases of which we as a nation, are in a peculiar degree the victims, as the neglect to harmonize food with the ever changing seasons.

The relish for food is an important consideration. The relish for food involves two elements, the vigor of appetite and the attractiveness of the food in appearance and taste. When a person is hungry and the food meets his approval in its kind and in the way it is prepared, this causes an abundant flow of the secretions in the digestive tract. For this reason soup is served first at a dinner as it acts as a stimulant and increases the flow of gastric juice. Also appetizing odors when there is a strong desire to eat, promote the flow of the different secretions needed in digestion.

When on the other hand, the appetite is poor or the food distasteful, the intestinal juices receive no such stimulus. Unskilful or slovenly cooking or an unwise selection of food may neutralize a vigorous appetite or even breed dyspepsia.

One parental weakness that cannot be too strongly condemned is allowing a child to acquire the candy habit. It is true that pure candy is made of sugar, which, under right conditions may play an important part in the animal economy. But sugar of itself exercises no constructive function and when the free use of sweetmeats is permitted, a desire for wholesome food is much lessened and the child is robbed of the nutrition to which it is entitled. The eating habits of some children are abominable, and for these habits the parents are responsible. It is a trite saying but a true one, that the intelligent farmers' calves and pigs are fed more rationally than many children.

Now a person may determine what he shall eat from two points of view, viz.: He may select his food on the basis of rational consideration of health, or may sensuously follow the dictates of appetite. It is to be feared that the latter point of view largely prevails. Man does not seem to regulate his diet by an intuitive sense of what is best for his physical welfare, but in a large number of cases is the unfortunate victim of unbridled indulgence in that which most delights his taste, but eventually ruins his health. The housewife who keeps the following facts in mind may combine foods in a way that will fully meet the needs of the human organism of whatever age or condition.

1. Brain workers need easily digestible food. Muscle workers find coarser food better suited to their needs.

Chippendale—Style 75

Proof of $100 Saving

We believe that if we can put into your hands positive proof of our ability to save you $100 on the price of a piano, you will be interested.

Here is our plain statement:

The Sherlock-Manning 20th Century Piano

"Canada Biggest Piano Value" is the height of achievement in case, tone, finish, wormanship, durability, action, hammers, strings—any and every part; and you get it for $100 less, backed by a ten-year guarantee.

760

2. No one meal need be "balanced," that is need contain proteids, carbohydrates and fats in a certain proportion, but each day's dietary should approach the proportion of one part proteid to five and a half parts carbohydrates.

3. Diet should be varied as well as mixed: i.e., do nto depend too much on potatoes for starch, serve rice or macaroni instead.

4. When planning a meal, think what has been served at the preceeding one. If starchy foods chiefly, supply plenty of proteid. Do not forget that butter, eggs, milk, etc., used in cooking, count as food just as much as if served by themselves at the table. By planning meals, in part at least, for several days ahead, you will find it easier to provide varied and rightly balanced fare.

5. Food is not necessarily nutritious in proportion to its cost.

6. Remember that plant proteid may take the place of animal proteid. If you have but a small piece of meat, serve peas or beans with it rather than beets.

7. Acid fruits should not be served with starchy food as the digestive action of the ptyalin of the saliva is retarded by the presence of an acid. For this reason dates, figs and bananas take first place as breakfast fruits, while mildly acid fruits such as grapes, pineapples, peaches, pears, sweet oranges and berries are second choice.

8. Familiarize yourself with the composition of common foods so that you may readily think of suitable combinations and know how to supply lack of one food by another of similar character.

The pleasures that a woman may give her family by a careful regard of these simple laws of food selection, are the most delightful of any though perhaps least appreciated. Good health is the most precious of all possessions and only to be had through a well chosen diet.

In almost any home the menus, when rationally judged, are seen to be more wasteful than any other department of family expenditure. The fact is we are so accustomed to certain eating habits that we do not realize how unnecessarily expensive they are.

The following is a menu that is simple according to the present standards of living but is much more elaborate than the diet upon which countless numbers of men and women have been well nourished.

Three meals, properly balanced, for six people.

Money allowed—$1.38.
Actual cost—$1.37.81.

Concentration.

"I've read my history three times and I don't know a word of it," said Tom.

Joe grinned. "That's because you read words and think of Saturday's football game. Wait till you get into one of Mr. Brown's classes in the high school, and you'll see."

"What will he see?" asked Aunt Mary.

"Mr. Brown won't let us read our history more than once," said Joe. "He says if your mind is open the first time, more knowledge will come in and settle in the one reading than if you dawdle over the same path a dozen times.

"Eyes aren't so hard to train as ears," Joe continued. "There's Frank Fiske in our class in school. His eyes went back on him, and he thought he'd have to drop out and not be graduated in June. Mr. Brown proposed that six of us fellows each take a lesson and study it aloud with Frank. I took Latin. It was hard at first, but now Frank can translate Virgil as fast with his ears as I acn with my eyes."

"I believe people train their sense of hearing less than any other faculty," said Aunt Mary. "In my Bible class of grown women, when I give out references there's only one in the class that catches the whole. She writes down book, chapter and verse as I give it. The others write the book and ask what chapter, or write the chapter and forget the verse."

"Mr. Brown ought to train them," declared Joe. "Whenever he gives us dictation, he doesn't deal out a word at a time. He reads a whole paragraph before we take up our pens, even, and then we get it as well as we can. I can write it almost straight now."

"Besides my Bible class," said Aunt Mary, "I'd like to send a great many shop clerks to him. When I give my name as Miss Sellars, and spell it for them, letter by letter, they blandly write, under my very nose, C-e-l-l-a-r s. They've never learned to hitch their ears to their hands.

"There's old Hepsy coming in. I owe her two dollars," continued Aunt Mary, "and my purse is upstairs. Please, Tom, go up to my room to the bureau at the left of the south window, and in the upper left hand drawer, in the box at the far right-hand drawer, you'll find my purse. Will you bring it to me?"

Joe laughed at Tom's bewildered look. 'I couldn't begin to remember all that, Aunt Mary," Tom said. "Tell me again."

Aunt Mary began slowly again, but before she was half through, Joe dropped the purse itno her lap.

"How could you remember?" demanded Tom.

"Only concentration again," answered Joe. "I listened a step at a time. Aunt Mary says 'upstaris,' and in my mind I go up and 'm there waiting for the next direction. She says 'my room,' and mentally I go in; and when she says 'bureau left of south window,' I'm there. Then it's easy to open the 'upper left-hand drawer,' and I'm ready for the back right-hand corner. I dont' take it as a mixed-up whole. I listen step by sted, and each step is a distinct picture of a separate action, and I take that action. I don't think of what's behind."

"I think perhaps I'll try that myself," said Tom.—Youth's Companion.

Who'll Whip You.

A lady of the capital city of A. said this happened in her own city: A lad came home with a pocketful of marbles he had won, and said, "Mother, see what I won."

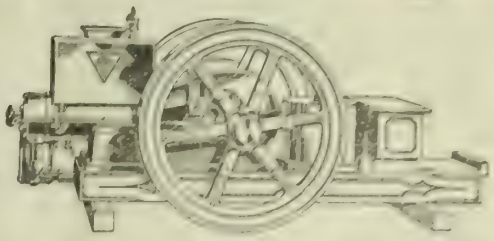
With a grieved voice she replied, "Son, did I not tell you you must not play marbles for keeps? I shall have to punish you for it. I am sorry to have to do it, but I cannot have you doing anythingof that kind. So come in here."

He went in and got what was coming to him. Then, when his voice was again manageable, he said, "Now, mother, I want to ask who is going to whip you for the prize you won at the card party and brought home."

Be sure she'll get what is coming to her, and it will be more than she will enjoy probably; maybe enough to break her heart. The little gambler is just following the example set him by the big gambler. When he gets to be a big gambler, the mother will have many heartaches.

Mother, are you guiltless? If you are a gambler, it is not probable that your boy will never think gambling a very great wrong even if the civil law does declare it a crime.—Ex.

Alpha Gas Engines

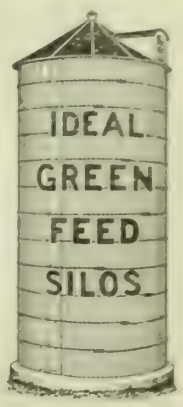


The Men Who Use Them Save Money

You can save money by using an Alpha Gas Engine just as do many other men. An Alpha Gas Engine is a saving investment any way you look at it. It will save money you now must pay out to get work done that requires power, because you can own and operate the engine at less cost than that of hiring some one with an engine.

It will do quickly work that you are now doing by hand and wasting a lot of valuable time over. It will pump water and do other similar jobs without attention and leave you free to get other work done. Your wife or your boy can start and operate it at many jobs to which you now must give your time. Having an engine will relieve you of the odd jobs that are time-wasters and give you more time to attend to the important work on your farm.

You need an engine and the sooner you buy one the quicker you will save the cost of the engine. Get an Alpha Gas Engine now, put it to work; and it will pay for itself in a few months. Ask for catalogue, prices and complete information.



Feed Silage

It is the best and cheapest feed for all kinds of live stock. Silage fed cows produce more milk at less cost than cows on any other feed. Stop the waste of your corn crop due to the fodder being dried and exposed to the weather and make the work of feeding easier by erecting an Ideal Green Feed Silo. It will pay for itself the first year and give you many years of service. Ask for catalogues that show why you get greater value for your money in this silo than in any other.

DE LAVAL DAIRY SUPPLY CO., Ltd.

LARGEST MANUFACTURERS OF DAIRY SUPPLIES IN CANADA.

HALF THE ILLS OF LIFE

Are Caused By CONSTIPATION.

When the bowels become constipated the stomach gets out of order, the liver does not work properly, and then follows the violent sick headaches, the sourness of the stomach, belching of wind, heartburn, water brash, biliousness, and a general feeling that you do not care to do anything.

Keep your bowels regular by using Milburn's Laxa-Liver Pills. They will clear away all the effete matter which collects in the system and make you think that "life is worth living."

Mr. B. W. Watson, St. John, N.B., writes: "I have been troubled with constipation, for the last three years, and during that time have tried several remedies, all of which failed to help me. A friend recommended Milburn's Laxa-Liver Pills, and after using three or four vials, I felt like a new man. I am now still taking them, and am positively sure that I am on the road to recovery. I strongly recommend Milburn's Laxa-Liver Pills.

Milburn's Laxa-Liver Pills are 25c per vial, 5 vials for $1.00, at all drug stores or dealers, or will be mailed on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

Calf Feeding Experiment.

A calf feeding test is reported by the North Dakota Experiment Station in which two lots weer fed, both on whole milk for the first three weeks; then Lot No. 1 was fed 8 lbs. whole milk and 8 lbs. skimmed milk daily, while Lot No. 2 was given 16 lbs. skimmed milk and 1 lb. boiled flax seed. During the first three months Lot. No. 1 made somewhat larger gains and looked a little more thrifty, but during the next three months, Lot. No. 2 caught up. At six months, several experienced dairy cattle breeders pronounced the calves in Lot No. 2 equal to those in Lot 1, in individual merit and dairy development. When the calves were five weeks old they weer also fed clover hay and a grain ration made up of equal parts whole oats and bran. To this was added one-tenth by weight of linseed meal. It cost $19 less per head to feed the skimmilk calves than those fed half whole milk, to the age of six months.

Just a Straight and Simple Story.

MISS BLANCHARD TELLS OF DODD'S KIDNEY PILLS

They Cured Her Kidney Troubles and Other Sufferers Can Learn From Her Experience How They Can Find a Cure.

Paquetville,· Gloucester Co., N.B.—March 7th. (Special.)—Simple and straight to the point is the statement of Miss Justine Blanchard, of this place. She has tried Dodd's Kidney Pills and found them good and she wants everybody to know it. Miss Blanchard says:

"I suffered for a long time with my kidneys. I used Dodd's Kidney Pills and they cured me completely."

One simple statement like that is worth a dozen learned dissertations on Kidney disease. It tells the sufferer from kidney trouble just what he or she wants to know—that a cure can be found in Dodd's Kidney Pills.

For Dodd's Kidney Pills are no cure-all. They are purely and simply a kidney remedy. The reason why they cure Rheumatism, Lumbago, Diabetes, Bright's Disease, Heart Flutterings, Dropsy, Pain in the Back, and other diseases is that all these are either Kidney diseases or are caused by disordered kidneys. Dodd's Kidney Pills cure them by curing the kidneys.

When to Plant Vegetaples.

Temperature and moisture requirements are governing factors in planting vegetable seed. Garden vegetables can be easily divided into two classes, namely: Cool season and warm season crops. There are three groups in the former and two in the latter class.

The first group is composed of short season crops, which cannot endure the heat of summer, but which can be planted in the open ground early enough to develop before hot weather. These comprise garden cress, leaf lettuce, khol-rabi, mustard, peas, radishes spinach and turnips. Additional plantings of lettuce, radishes and peas can be made to secure a succession. Some of these crops can also be grown in the autumn if there is sufficient moisture.

The second group consists of those which cannot endure excessixe heat and which require such a long period of growth that the seed must be started under glass, and the crops transplanted. These are early cabbage, early cauliflower and head lettuce. Late cabbage and cauliflower are started at such a time as to complete their growth during the cool fall months.

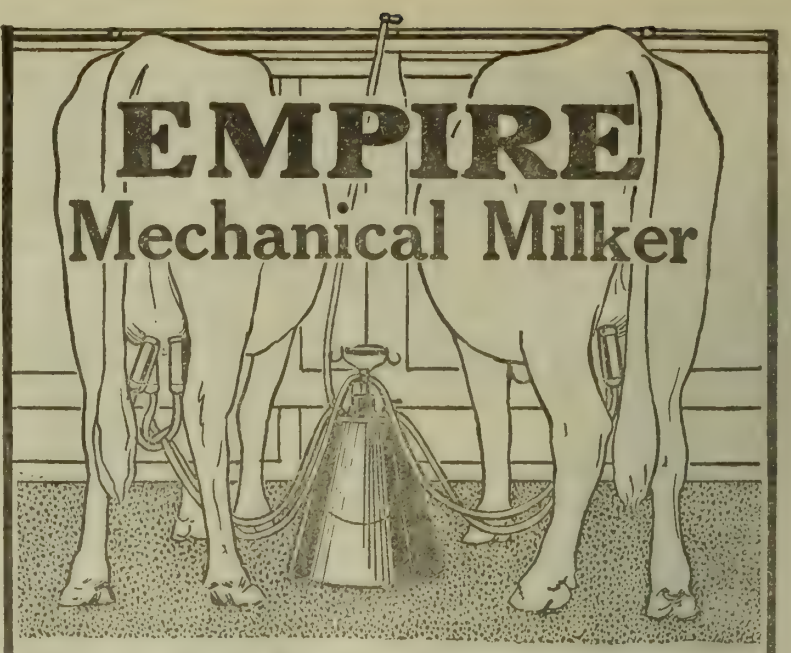
The third group demands cool, moist weather during their early stages, but are capable of enduring considerable heat and drouth after becoming fully established. These include beets, carrots, chard, kale, leeks, onions, parsley, parsnips, early potatoes, salsify, upland cress and New Zealong spinach besides the perennial crops, asparagus and rhubarb.

Help the Young Trees.

Many young trees, through the action of the wind, wave about and wear an opening in the soil at their base, thus admitting water and air to their detriment. One can keep a close watch and straighten up these loosened, swaying trees, filling in around them as neceesary, especially after a strong wind, which usually accompany a rain that has made the ground soft and yielding, but some times this is not done till incalculable damage has been done the trees. The preventatives are preferable to the "cure."

Four stakes are driven firmly in the ground, and soft strings run from stakes to tree trunk, allowing only slight movement of tree. One stake is driven on the north side of tree and one on west side. Stiff sticks are securely tied to stakes and trunk of tree. Sticks must be wrapped with cloth where they come in contact with tree. This also is a fine metho dof straightening up a tree with a crooked trunk, one of the stiff sticks being bound to the trunk at a point considerably higher than the other, and a third stick attached to the stake, lower down on the trunk. The length of these sticks will be determined by the crook of the tree, they being arranged so as to pull it straight. Sticks should be forked, to facilitate fastening to trunk of tree. —M. Coverdell.

Every householder should have ice during the summer months and they could have it if it were provided for during the winter. A little common sense with a little muscle combined with a few tools are the chief requisites. Harvesting the ice crop is a simple operation an drather enjoyable than otherwise, and it yields large returns if its refrigerating effect is properly applied. Ice is so common in January that it seems hardly worth considering, but in July we are ready to pay most any price for it. Therefore, plan to put up some ice in January to use in July. Everybody knows how to pack ice in the old style ice house and this is the way to start. After a little you will want an improved ice storage house with cold storage space in it for handling the more sensitive food products.



EMPIRE Mechanical Milker

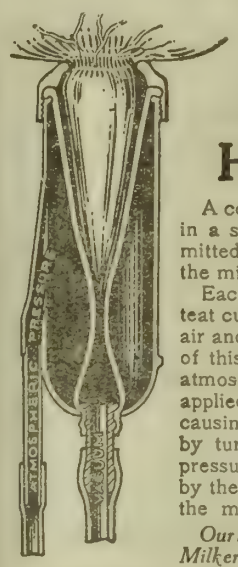
Takes all the Drudgery out of Dairying— Turns Wages Into Profits

Frees you from depending on hired help—
Makes it possible to keep more cows—
Milks them more Regularly and Uniformly—
Coaxes them to Let Down Milk more Freely—
Protects the Milk from Dirt, Germs and Odors

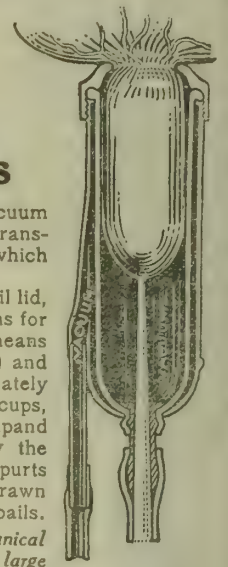
What it Accomplishes

One man with one double or two-cow unit will milk 20 to 30 cows per hour—one man can operate two double units. An Empire Mechanical Milker will quickly pay for itself with even a very few cows. With one or two double units you can handle a good big herd alone, and do it quickly and easily.

The "Empire" so successfully imitates the action of a sucking calf that it is easier on the cows than hand milking, and usually gets more milk. Flowing directly through the tubing from the closed teat cups to closed pails, the milk is always protected from stable air, dirt and germs



Thus, the "Empire" gets more and better milk, saves time and wages, and solves the serious problem of hired help.



How It Works

A compact air pump creates a vacuum in a steel tank. This vacuum is transmitted along the stalls by piping, to which the milking units are connected.

Each unit consists of a pail, a pail lid, teat cups complete with connections for air and milk, and a Pulsator. By means of this Pulsator, vacuum (suction) and atmospheric pressure are alternately applied to the linings of the teat cups, causing them to collapse and expand by turns, massaging the teats by the pressure, then drawing the milk in spurts by the suction. The instant it is drawn the milk flows into the closed pails.

Our literature about the Empire Mechanical Milker is of interest to owners of either large or small dairies. We will send it to you on request without any obligation to you. Just write us saying, "Please send me information about Empire Mechanical Milkers". Address Dept. L 31

"The Best Horse Clipping Machine"—

That is what customers in every country say of the

Stewart Ball-Bearing Machine

It turns easiest, clips fastest and endures the longest. Its file hard cut steel gears running in oil will last a lifetime. It has feet of new style, easy running flexible shaft and the new patented Stewart cutting head, highest grade. Clip off the heavy winter coat from your horses before the spring work begins. They will look better, feel better and do better work. Get one of the Stewart Ball-Bearing Machines from your hardware, saddlery or implement merchant, at only $9.25.

Insist on a Stewart Machine, the only one that will give you good service. Write us if your merchant does not have it.

The cause of decay in Stored Apples

(By J. B. Keil, Ohio Experiment Station.)

Observant fruit growers who have followed the product of their apple trees through the season of storage know that various causes contribute to the decay of stored fruit and that some of the decay is plainly premature, while that appearing after the antural ripening of the fruit is more or less to be expected.

The early decay appearing soon after storing, varying in extent with the natural resistance or susceptibility of the variety, can very largely be traced to injuries which break the skin of the fruit, such as the stem punctures, scratches from sharp corners on crates or picking vessels, or even from the finger nails of pickers or graders, are the starting points for the early decay in storage. The organism responsible for decay in most cases is the blue mold (Pennicilium glancum), spores of which are very numerous, and are present in the atmosphere, readily entering any point of injury. So far as personal observations extend, the fungi comomnly found in connection with decayed apples are unable to find entrance to the fruit when the skin is unbroken.

The change brought on by the ripening of apples—the natural period of maturity of sound fruit—makes the flesh tender, and the skin is more easily injured by handling in such a condition. Also the minor imperfections, such as stings of insects; the feeding or egg-laying punctures of the curculio; leather cracks, and spots affected by apple scab or apple blotch may becomes the points of entrance for spores of the fungi causing decay. Storage scald is very commonly followed by black rot (Spaeropsis malorum) which very quickly destroys the apples so affected. Very late in the season even the stem of the apple may become affected in a mold, especially if the cellar is somewhat moist, and carry the fungus down into the fruit.

Water core and other forms of internal breakdown are related to the physical condition of the fruit, and favor decay through the softening or breaking down of the tissues.

Against the early or premature decay one factor is prominent; that is, careful handling. The utmost care compatible with profitable operation, to prevent, if possible, all injuries which break the skin of the fruit, is desirable. Over-full picking bags or vessels; unpadded baskets or sorting tables; rough handling of tender-skinned varieties; stacking up of crates filled to above the level of the upper edge; storing in bulk; undue pressure of box lids or barrel heads, and other forms of abuse to which apples are subjected are all to be considered and avoided in every possible way.

Against the decays following maturity, there is also one prominent factor, that is, sound fruit. In storage tests conducted in the station fruit cellar, a sample of perfectly sound Grimes was kept from the time of picking and storing, early in October until March 1st without decay, and with no other change except the natural ripening process and a slight shriveling due to the dryness of the cellar. Comparing this with the average commercial limit in cellar storage of Grimes, it is not difficult to realize that sound fruit properly handled and stored should keep well beyond its natural period of maturity.

In considering these storage problems, one must look upon the influence of temperature as affecting both the ripening process and the development of decay from any cause.

These processes are retarded in direct ratio to the lowering of temperature; but within the range of safety for the fruit, low temperatures are not sufficient to render the organisms of decay inactive. Therefore the importance of careful handling, and of storing only sound fruit in order to secure best results.

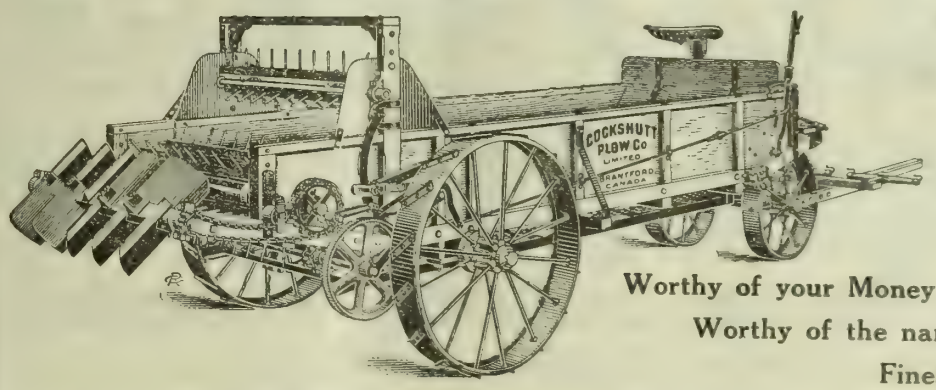
Radishes Free from Maggots.

All the gardening manuals I have read agree in saying that the white maggot which attacks radishes hatches from eggs laid on the leaves or stems of the young radish plants by a fly. If this be so, I thought it might be practical to try shutting this fly out of the radish patch, for if there are no eggs laid on the plant stems there should be no maggots at the roots.

Acting on the idea I put together a light frame 4x16 feet, nailed on 18-inch legs at each of the four corners and covered the whole with mosquito netting. This screen was placed over the radish bed within 48 hours after sowing the radish seed and kept in place until the radishes were all grown and pulled. It worked fine—not a maggot scarred radish in the entire bed.

The netting is held down to the ground by placing a loose board on the edge, and when any radishes are wanted this is lifted off, the netting raised without moving the frame or leaving any opening for the fly to sneak in. I have followed this plan with gratifying success for several years, while some of my garden-making neighbors, who had given up trying to grow early radishes because of this maggot pest, have adopted it and are having good success. It is inexpensive and practical for the hemo gardener.—L. G. Brown.

Here's a REAL MANURE SPREADER



Manure is worth $27, in hard cash, per animal, per year—if you use it right. Can you afford to throw this money away?

It's easy to make a machine that merely "dumps." The Cockshutt "spreads."

Worthy of your Money.

Worthy of the name of Cockshutt.

Finest kind of investment.

BECAUSE we know how necessary good fertilizing is, because we know from investigation how many thousands of dollars are wasted through hap-hazard methods of manure spreading, we have never been satisfied until our experts turned out a Spreader that we could put the Cockshutt name on and sell to you as a real, perfect Spreader. Here it is—the picture above does it very scanty justice. Learn more about it.

There is all the difference in the world between having a load of manure pitch-forked in lumps and chunks onto the ground and having it pulverized and spread over the field, like a blanket. The first way means waste—waste of time, work, fertilizer and crop. The second way is the Cockshutt way.

The Cockshutt Manure Spreader has chain drive—the strongest made. All levers are easy to work and right at driver's hand. Has the famous Cockshutt light-draft, yet it will give a life-time of hard work over rough or frozen ground. Bottom of box is stationary, no clogging or breaking of slats or rollers. The emptying gear—heavy steel angles held together by endless chains—is simple yet positive and cannot get out of order.

Extra to the usual spike-studded distributing cylinders at box end, the Cockshutt has a special Distributor which breaks up even hard lumps and gives a wide distribution as well as perfect pulverizing of the manure.

Box is low, only 41 inches from ground, yet with 17 inches clearance underneath. Makes the heavy work of loading easy.

Here is an implement that will very soon pay for itself on any Farm. Write to-day to our nearest branch or head office for illustrated folder on the Cockshutt Manure Spreader.

THE FROST & WOOD CO., Limited,

MONTREAL. SMITH'S FALLS, ONT. ST. JOHN.

Shipping Potatoes in Cold Weather.

(Continued from Page 345).

are as desirous that the potatoes should reach their destination in good condition as the shipper. When cars are loaded as above explained they are practically frost proof for several days providing, however, that the temperature of the potatoes when loaded is considerably above the freezing point. It could not be expected that potatoes which are taken out of a cellar at a temperature of say 35°, would stand much frost in transit as compared with those that are taken out at a temperature of 50° or 60°. This point should be clearly understood. The initial temperature of the potatoes themselves is very important to their safe carriage in cold weather as it is the stored heat in the potatoes that gives the frost-proof qualities to the protection of straw, shavings and paper.—Madison Cooper.

The Making of Sauerkraut.

Select hard, well-developed cabbage heads. Remove the outer leaves, leaving only the crisp, white portion, then with a knife or special instrument made for the purpose, remove the core of the cabbage. Cut the cabbage on a kraut-cutter, which can usually be obtained at a hardware store at a nominal price. These cutters vary in size from one to six-inch knife blades, a little box fitting into the groove of the frame holding the knives in such a way as to premit the box to move back and forth over the cutting edges. The prepared cabbage heads are placed in this box and are thus sliced with the knives below.

The knife or cutter is generally placed on top of the vessel containing the kraut. A crock or stone jar holding from five to fifteen gallons is the best receptacle to use, on account of its cleanliness, and for family use. Proceed to fill the vessel or jar as follows:

Sprinkle a thin layer or salft in the bottom of the vessel, then place two inches of kraut on top, then sprinkle this layer with salt sufficiently to show the salt on the kraut. Proceed in this manner until the vessel is full. At intervals, pack the kraut down firmly in the vessel. For a ten-gallon container, use a pound to a pound an da half of salt. After the vessel is filled and packed down firmly, take a clean piece of board that will fit inside of the receptacle and place this on top of the kraut and weight it down with some clean stones, or anything that will keep the kraut under pressure.

In a few hours, the water from the kraut will rise to the top and above the kraut. It should be left in this condition until ready for use.

It requires from four to six weeks before the kraut is ready to be utilized.

The receptacle containing the kraut should be kept in a cool, shady place.

On a commercial scale, the kraut is generally packed in barrels, and the makers pay little or no attention to the amount of salt used, as it becomes a habit with them in sprinkling a layer of salt over a layer of kraut.

The packing of the kraut is very important. Only sound cabbages should be used.

A Future Promlem.

The Maritime Merchant thinks that the next big problem after the war and the settlement of the land will be that of a national system of roads. We have pretty nearly completed what railway construction is necessary in Canada. We may have to build occasional spurs and short branch lines, as local needs arise, but we have certainly equipped ourselves very fully in the matter of main lines. And think of the many millions and millions of dollars we have spent in providing all this equipment. But while we have been doing this, says the Merchant, we have apparently thought our public highway system of secondary importance. At least we have acted as if we have considered it in that light. The importance of a good system of public roads, however, is quite on a par with the importance of a complete railway system. In fact, both are co-ordinate parts of our transportation system and the neglect of our roads simply impairs, to the extent we neglect them, the efficiency of our railways. We fall short of the success our railways ought to give us to the extent that we neglect our roads.

Perhaps our various governments will turn their attention more seriously to this problem. Now that we have completed our railway system, it seems logical that we should turn our attention earnestly to the common roads which are as it were the hands of the railway reaching out to gather up traffic. Much national upbuilding has accompanied our railway building; who can measure the amount of it? A similar and possibly a greater measure of upbuilding would follow the making of suitable roads. And how much smaller an undertaking it would be to solve our road problems. May we not turn to them with as good courage as we once turned to our railway problems?

Out of 71 counties in Wisconsin there are 50 that have local organizations for the development of the pure seed growing industry.

AN IDEAL TONIC

When your head is dull and heavy, your tongue furred, and you feel done-up and good for nothing, without knowing what is really the matter with you, probably all that is needed to restore you to health and vigour is a few doses of a reliable digestive tonic and stomachic remedy such as Mother Seigel's Syrup. Take it after each meal for a few days and note how beneficial is its action upon the stomach, liver and bowels—how it restores tone and healthy activity to these important organs, and by so doing enables you to gain new stores of vigour, vitality and health.

FOR THE STOMACH AND LIVER

MOTHER SEIGEL'S SYRUP

The new 1.00 size contains *three times as much* as the trial size sold at 50c per bottle.

Two Weeks' Course in Agriculture

AT THE

Agricultural School, Woodstock, N.B.

MARCH 20th to APRIL 1st, 1916

The First Week will be devoted to Fertilizers, Soil Management, Insect Pests, Plant Diseases and Spraying.

The Second Week will be devoted to all classes of Live Stock and Field Crops.

The only expense to you will be Board while in Woodstock and Railway Fare at Reduced Rates. Purchase a Single First-class Ticket to Woodstock and get a Standard Certificate from the Ticket Agent.

A list of suitable Boarding Houses will be provided to Students.

Applications for enrolment in this course will be received up to March 18th, but should be sent in as early as possible. Send applications and inquiries for further information and full program to A. G. TURNEY, Fredericton, N. B.

NEW BRUNSWICK DEPARTMENT OF AGRICULTURE,
HON. J. A. MURRAY, Minister.

Humus.

The old time gardener seldom made up a potting compost without the addition of leaf mold, he had been taught by generations of experience, it was a valuable substance to add to his potting soil. While he may have been ignorant of its chemical effects, he knew the physical effects of keeping the soil open by keeping the particles of sand an dclay asunder, thus improving its aeration and porosity.

Experience also tauught him that it is "hungry stuff" and that with the exception of some plants, such as ferns; few plants would do their best in it.

Among the laymen, the common error was and is still prevalent that humus or leaf soil is rich in plant foods, but the practitioner knows better. It does, however, perform important functions in the soil in addition to the physical ones of keeping it open, retaining heat, and holding moisture.

The decaying leaves are a medium for the existence of certain fungi which are very beneficial to the growth of certain plants, notably the Heaths, Conifers, Beeches, Chestnuts, etc. The fungal threads or filaments can readily be seen investing the roots of these plants, and are only present when they are in good healthy condition. It has been suggested that the true cause of the Chestnut blight is really due to the loss of humus and the attendant beneficial fungi. When one stops to consider now from what they were when the chestnut forests were in their prime, the suggestion does not appear so unreasonable, perhaps in time the scientists will prove it to be actually the case that the blight could never have made headway, if the humus could have been conserved.

The forest fire, and the baring of the whole country of growth not immediately useful to man, has undoubtedly upset the balance of nature, results of which are sure to be far reaching and not altoegther to our profit.—The National Nurseryman.

Fall Plowing and Frost

While the effects of the frost are evident in early spring, the heavy soils may require an entire winter's exopsure to the cold. To plow the land in the fall and leave it in the rough condition during the winter may entail the loss of soluble plant food, but the management of a farm depends largely upon the texture of the soil and the crops grown thereon. Lime gives best results when applied in the fall and it is an old maxim of farmers that all soils are benefited by lime and frost. No matter what the substance may be, should a few molecules of water effect an entrance between any of its particles disintegration to a certain extent will be the consequence. Hence as the frost is a friend to the farmer, he should endeavor to utilize its power as much as possible. He should leave the soil loose in the fall for the frost to enter, or he should endeavor to plow early in the spring in order to secure the benefits from later frosts. When fall and spring plowing is done the cutworms and other insects are brought to the surface and exposed, which destroys many of them. The frost is nature's greatest pulverizer and it works quietly and surely. It's advantages may not be apparent, but without its aid the long winters would soon render the earth so close and compact as to render cultivation impossible, but a wise Providence allows wtaer to expand with both heat and cold, thereby performing for mankind that which could not otherwise result.

Nerve Collapse

The Remedy

Rx Powerful Nutrients, Hypophosphites, Nerve Restoratives, Valuable Stomachics.

Prostration and Vital Exhaustion are Cured by Dr. Cassell's Tablets.

It is because Dr. Cassell's Tablets overcome vital exhaustion that they are so sure a remedy for nerve breakdown, brain fag, and all run-down conditions. They contain valuable nerve nutrients and body builders, which by strengthening the nerves and enriching the blood restore vital power to the whole system, and so build up new strength and physical vigour.

Sir John Campbell, Bart., C.B., formerly Major-General in the Royal Artillery, derived so much benefit from taking Dr. Cassell's Tablets that he wrote to the proprietors in praise of the remedy. He said "I have pleasure in stating that I have derived great benefit from Dr. Cassell's Tablets, and have found them remarkably effective in restoring the nerve energy and physical vigour which advancing years naturally impair. They suit me admirably and I have every confidence in recommending them as a safe and reliable bodily restorative." The experience of this great soldier is the experience of uncounted thousands in all parts of the world. They are the surest of all restoratives, and equally suitable for old or young. A British remedy from first to last.

Dr. Cassell's Tablets are Nutritive, Restorative, Alterative, and Anti-Spasmodic, and of great Therapeutic value in all derangements of the Nerve and Functional Systems in old or young. They are the recognised modern home remedy for Nervous Breakdown, Nerve and Spinal Paralysis, Infantile Paralysis, Rickets, St. Vitus' Dance, Anæmia, Sleeplessness, Kidney Disease, Dyspepsia, Stomach Catarrh, Brain Fag, Headache, Palpitation, Wasting Diseases, Vital Exhaustion, Loss of Flesh, and Premature Decay. Specially valuable for Nursing Mothers and during the Critical Periods of Life.

Druggists and Dealers throughout Canada sell Dr. Cassell's Tablets. If not procurable in your city send to the sole agents, Harold F. Ritchie & Co., Ltd., 10, McCaul Street, Toronto; one tube 50 cents, six tubes for the price of five. War Tax Extra, 2 cents per tube.

Sole Proprietors:—Dr. Cassell's Co., Ltd., Manchester, Eng.

Growing Crops Without Potash in 1916

And Pharoah commanded the same day the taskmasters of the people and their officers saying: Ye shall no more give the people straw to make bricks as heretofore, let them go and gather straw for themselves, the tale of the bricks which they did make heretofore ye shall lay upon them, yea shall not diminish aught thereof, and the taskmasters of the people went out and their officers and they spoke to the people saying, thus saith Pharoah, and will not give you straw; go ye get straw where ye can find it, yet not aught of your work shall be diminished; then the officers of the children of Israel came and cried unto Pharoah saying: Wherefore dealest thou thus with they servants, there is no straw given unto thy servants and they say to us, make bricks, and behold thy servants are beaten. He said: Ye are idle, go therefore now and work for there shall no straw be given you ye shall deliver the tale of bricks.

Bricks without straw; crops without potash. For more than a generation Nova Scotia agriculture has been depending on the purchase of plant food in commercial fertilizer. It has been a matter of great concern to many farmers engaged in agriculture that it has not been self sustaining and that it has been necessary to look outside of its borders for the needed extra plant food. Examination of statistics indicate that the introduction of commercial plant food to Nova Scotia agriculture has steadily advanced, not only in the total yield but in the net profit per acre, there are very few present who remember when potash was made an essential part of commercial fertilizer. This occurred in the seventies up to that time the fertilizers mostly used was guano and dissolved bone, black, these carried nitrogen and phosphoric acid, but no potash. Many experiments have been made and many treatises have been written showing the value of potash in agriculture. The experimental data showing how crops can be grown without potash are few. The papers which I present here today is based on experiments conducted by some of the farmers of Lunenburg County and the Maine Agricultural Experimental Station. The past season a series of experiments was conducted to determine the effects of different amounts of potash. The plots without potash gave 302 bushels of potatoes per acre; plots with 2 to 5 present potash gave practically the same yield of 320 bushels per acre; there was a slight increase on the 8 per cent potash over the former plots, a yield of 3.30 bushels, a balance of 28 bushels per acre over the plots with no potash at all. It must be granted that the above tests are not final. The above is considered a big yield for an off year, much above the average for Nova Scotia.

Albert Veinot, of West Northfield, Lunenburg county, veteran potato grower, conducted an experiment the past summer on potatoes. Mr. Veinot had some potash held over from the previous year. He bought some acid phosphate and nitrate of soda to mix up a 4.8.10 mixture, sowing 8 ct. broadcast and 8 ct. in the drill on one acre, did not have enough for the other acre. He bought a 4.8.4 mixture, the best available last season. He applied the 4.8.4 same as the former acre; the 2 acres were treated alike. Mr. Fuller, the judge on field crop competition judged the above field in September, and said that the acre with a 4.8.10 had nothing on the field with a 4.8.4. At the time of digging the 4.8.4 was as good as the 4.8.10. Some farmers in the county grew as high as 75 bushels of oats per acre on a 4.8.10 mixture, the soils in question were mostly of a clay loam. Nitrate of soda is higher this year than in former years. Many reasons account for this. Nitrate is used for making explosives. Tonnage is high, and there is a slide in the Panama Canal, which makes a long trip around the Horn. It is hoped that the slide will soon be removed. It is hoped that soda will be cheaper by spring and phosphate is also higher on account of sulphuric acid being used in the manufacture of high explosives.

Most of the fertilizers for next season's use are in the various storehouses and the potash in these goods is not above 1 per cent. For this 1 per cent the farmer will have to pay $5.00 in the wholesale fertilizer trade. Raw materials are bought and sold on the unit system. The unit is 1 per cent or 20 lbs. per ton. The prices on fertilizer was set in October by the fertilizer combine. The question is: will it pay us as farmers to buy this fertilizer with one per cent of potash, and pay $5.00 for the same, or will we buy plant food straight or what the market has to offer plus the potash. What we will have to do is to work the soil more next season than we ever did in the past, so as to make the plant food available, the result will be crops without potash. It is my wish to have this potash question debated at all farmers' meetings.

WALLACE RHODENIZER.

The Blackberry may be Grown by Everybody.

(Continued from Page 347.)

ry fruits but once on the same canes, and new canes annually replace the old ones which die during fall and winter. A handy instrument to cut and pull out these old canes is a hooked blade on the end of a three-foot wooden handle, which a smith can form from an old hoe blade.

The next work is to plow and cultivate the middles and continue this until fruit is picked, unless there is a mulch thick enough to smother weed growth. Early in the spring the shoots of the new canes will be seen coming up from the collar of the vine as well as in the form of suckers from the roots. As soon as these new canes reach a height of from two to three feet, their tip or terminal bud should be pinched off to check upward growth and cause side limbs or laterals to start out. This process makes a strong, stocky bush which will stand erect under its load of berries. As the new canes do not all appear at once, the rows must be gone over every few days in order that all canes may be pinched at proper height. In addition to cultivation, the rows must be kept clear of weeds and grass with the hoe.

As the new shoots appear, the indications of rust must be looked for. It will be detected in the peculiar crimping of the top leaves and a little later it will break out on the lower side of the leaves, gradually changing in color, as it ripens to a deep red. This means that its spores are ripe and ready to float about and infect other plants. Every effort should be made to prevent the ripening of the rust spores. There is no remedy known for this disease, and as soon as infection is discovered, the whole vine should be grubbed out with its roots and burned. Rust signs should be carefully looked for every four or five days. When the fruit begins to turn, pickers should be engaged. Boys generally apply for this work and will do well if under the eye of an overseer. They are paid 1½ to 2 cents per quart box. They will pick much faster if given tin buckets to suspend from their waists and these buckets, when full, are poured into boxes and crated for market. The pickers are given tickets, calling for so many boxes, and these are redeemed every Saturday. The greatest difficulty with boys is in getting them to pick clean.

There is an excellent general demand for the blackberry. Every housekeeper wants it to can or to make jam, jelly or preserves. The workingman loves the fresh fruit in pies.

It is a well-recognized fact, though one too often overlooked in selecting sites for orchards, that cold air settles to the lower levels. For this reason it is often colder at the lower elevations than it is at higher points in the same locality. This is what is meant by "atmospheric drainage." The occurrence of frost in low places when there is there is none on elevated areas is thus explaind. For th same reason peach buds are often winterkilled or the blossoms are injured by frost in the spring in low places when nearby orchards on higher elevations are included much less, or even escape entirely.

loss in fruit over 80 per cent, as shown by Government tests in 19 different orchards. Used on potatoes, a SPRAMOTOR has increased a yield of almost nothing to 400 bushels an acre.

You Have Many Uses For This Machine !

We are frank in telling you that a SPRAMOTOR, rightly used, will earn its cost the first season and pay you a handsome profit besides.

Our SPRAMOTOR is a very adaptable machine—one that will benefit you in many ways. It saves orchard trees and row crops with equal certainty, destroys weeds, kills rot, blight, canker, lice, beetles and all parasites.

It throws paint or whitewash on to buildings twenty times as quickly as by hand, and does a better job. Used with disinfectant, it protects horses and cattle from biting, tormenting flies and lice. It reduces the percentage of

Spramotor

It isn't a SPRAMOTOR unless we made it

THE LONDON SPRAMOTOR,

2814 King Street East, LONDON, Ont.

The SPRAMOTOR stands unequalled in the whole world as an effective spraying machine. It has won over 100 Gold Medals and First Awards against all comers. Twenty distinct patented improvements on the SPRAMOTOR that no other machine can have. Prices run from $6 up to $400—dozens of styles and sizes. Let us send you FREE our valuable illustrated treatise on Crop Diseases. Postcard brings it quickly.

MADE IN CANADA—NO DUTY TO PAY

Doctor Said Only Hope Was in an Operation

Was Skeptical When He Began the Use of Dr. Chase's Ointment—Relief Came Quickly.

Here is a plain, honest statement in regard to Dr. Chase's Ointment. Between the lines of this letter you can read the gratitude which its writer feels. One does not suffer from annoying, distressing piles for ten years without appreciating a cure when it is obtained.

Almost every mail brings the report of someone who has been cured of piles by the use of Dr. Chase's Ointment. Such statements are never used without the permission of the writer, and until we are satisfied that the cure is genuine and the writer a person of responsibility.

You may believe in operations for piles, and think there is no other cure. Write to Mr. Ingles, enclosing stamp, and he will gladly verify his statement. He will tell you that the pain, the expense, the risk of an operation are quite unnecessary. That relief and cure come with the use of Dr. Chase's Ointment.

Mr. Ernest W. Ingles, Penticton, B. C., writes: "I suffered from piles for ten years, and though I tried all kinds of ointments and injections I really had no permanent relief until I used Dr. Chase's Ointment. When I began this treatment I had absolutely no faith in it, for I had been examined by a well-known physician in Vancouver, and he said that an operation was the only thing that would benefit me. It was surprising the relief I obtained from the very first box, and now after using four boxes I am practically cured. My case was so exceptionally bad that I received no relief day or night, and for this reason the results are wonderful."

You can obtain Dr. Chase's Ointment from any dealer at 60 cents a box. If you do not want to risk this much send a two-cent stamp to pay postage, and mention this paper, and we shall send you a sample box frec. We are so certain that any sufferer from piles will obtain relief by using this ointment that we do not hesitate to make your this offer. Edmanson, Bates & Co., Limited, Toronto.

"METALLIC" covered buildings defy the elements

RAIN SNOW FIRE STORMS HOT SUN LIGHTNING

THIS is a strong but a true statement. "Eastlake" Galvanized Shingles on the roof, "Empire" Corrugated Iron or "Metallic" Siding on walls, and the building will last for generations. And it will do more than just "last,"—it will be always fireproof, stormproof, lightning-proof, neat in appearance, and dry inside. Thirty years of successful use all over Canada prove these statements.

"Eastlake" Shingles

have already stood over 30 years. They make your building safe from fire. Easily laid yet no storm can lift them, no sleet or rain can drive underneath. Fit snug and tight in the valleys. "Eastlake" heavily galvanized shingles are the original and best; their patented features can never be equalled. Get our prices.

"Empire" Corrugated Iron

is always uniform in gauge and size, therefore it is easily and quickly laid by even inexperienced labor. Has deep, snug-fitting corrugations and makes a strong, rigid fireproof wall that needs no paint or repairs. All "Metallic" goods are heavily galvanized. Our prices will interest you.

"Metallic" Siding

Is fire-proof, neat, easily laid, inexpensive and durable. It saves you insurance, protects the lives of your family—your stock—your goods—from the fire fiend. Our Rock, Brick and Clap-board patterns are sharply embossed and very popular. Write for prices and illustrations.

"Metallic" Ceilings

Are famous for beauty, sharp embossing, ease in laying and durability. They banish the wall-paper problem and free you from cracked plaster and peeling wall-paper. Quite inexpensive. Make a beautiful, sanitary, easily cleaned, fire-proof covering, that is readily nailed on over any surface. Splendid for Sunday schools, halls, etc.

"Metallic" building materials also include "Empire" Silo Roofs, low-priced but money-savers; "Halitus" Ventilators, very efficient and durable; "Acheson" barn roof-lights for light and ventilation; Conductor pipe, Eave-troughing and many other specialties in metal. Made in Canada under our 30 year old motto, "Quality First." Send for illustrated booklets, price lists and our helpful building suggestions.

Feeding Newly Hatched Chicks.

The first feed should consist of two parts bran to one of rolled oats, which is fed in shallow tin pans, in the bottom of which is sprinkled some chick grit. The chicks are allowed to pick at this for about 10 minutes and then it is removed.

For the first few days they are fed five times a day—very sparingly as above. During the first week the mash is gradually changed until it contains equal parts of bran and rolled oats.

Another good feed to start the chicks on consists of rolled oats and hard-boiled eggs. The eggs used are the sterile ones taken out of the incubator at the first test. These are boiled hard, then ground or chopped fine, and mixed with the rolled oats in the proportion of about six parts rolled oats to one of chopped eggs. This be fed sparingly and freqeutnly as directed for the first mentioned feed.

On the second day a little fine cracked chick grain is sprinkled into the litter for them to scratch for. There are several chick grain mixtures sold on the market that are very satisfactory, and that are valuable to persons raising btu few chickens. The grain ration given here is home mixed and is made up as follows:

Fine cracked wheat, 15 parts by weight; pinhead oats or granulated corn meal, 10; fine screened cracked corn, 15: fine cracked peas, 3; broken rice, 2; chick grit, 5; fine charcoal, 2.

This grain mixture should be fed during the first three weeks, then gradually changed during the fourth week so that at the end of the week it will contain: Cracked corn, 4 parts by weight; cracked wheat, 2; pinhead oats, . The garins are cracked somewhat coarser than for the chick feed. This grain mixture is fed for the remainder of the summer.

During the second week the mash should cotnain a little corn meal, which is gradually increased, and later animal meal and Daisy of low grade flour are added, so that at the end of the second week it contains; Bran, 1 part by weight; corn meal or barley meal, 1½; rolled oats, 1; Daisy flour, ½; fine beef scrap ½. The chicks should b fed this about four times a day.

During the third week this mash is gradually changed by dropping out the rolled oats and adding gluten meal, and increasing tne other ingredients until it contains: Bran, 2 parts; corn meal or barley meal, 3; gluten, 1; Daisy or low grade flour, 1; beef scrap, 1. It is kept in a hopper before them at all times.—William F. Schoppe, Montana.

What This Trade-Mark Means to You

It's your guarantee that every can of Canada Paint is full measure, pure, durable, economical, full value and must be satisfactory.

The highest grade materials and the skill of paint experts combine to make

CANADA PAINT

the best quality of paint that can be produced. You never have to guess what is in the can with the Canada Paint trade mark. Look for the C. P. and insist on having it—twice the price won't buy better value.

Send for our Free Booklet "What, When and How to Paint," it will help you to select the right finish for each particular purpose.

Excellent summer bathing. Splendid opportunity for market gardner. Only ten minutes to churches and station. Owner's reason for selling, ill health. For further particulars, apply to W. H. SWEET, Hantsport, N. S.

Pedigreed Nursery Stock.

The recent work of the bureau of plant industry has shown some very interesting results from the practice of bud selection. This work has shown conclusively that pedigreed nursery stock is just as important in raising productive fruit trees as pedigreed calves in raising a high grade of cattle. They attach even more importance to bud selection in tree production than to seed selection in corn and cotton. Their experience, covering several years, has shown the old practice of taking buds from young trees to be unwise. In this manner a great many worthless trees are produced. Bud wood should be chosen only from old, bearing trees on which a close record has been kept for a number of years. These trees, in addition to being good bearers should conform to your standard type. Nor is it enough to select your bud wood from a productive or desirable tree; it should also be chosen from a limb which is productive and which has strong, healthy buds.—Fred W. Davis, Texas Commissioner of Agriculture.

Two Greeks in California have started a sheep-cheese factory—the first to be operated in America. They will operate a plant consisting of 175 acres in alfalfa, 100 acres of dry feed, 1250 selected ewes whose lambs will be marketed at three months and the ewes then milked for four months

SEED OATS

Insure a bigger crop this season by sowing "H. & S." specially grown Banner Seed Oats. Put up in 3 bushel stamped bag. Write for samples and prices. If you can handle carload of produce, write or wire for quotation.

P. E. Island's Quality Reputation.

Thirteenth Provincial Seed Fair Scores Another Success.

One cannot read the Prince Edward Island Press and fail to be impressed with the advancement that is being made along agricultural lines by the Island Province.

Prince Edward Island is the smallest province of the Dominion yet like Mickey Free's expression we must say, "the quality of the land is there." A great deal of good is being accomplished by the Institute System in that province. The various meetings are well advertised and well attended. We would also judge that the various members of the Department of Agriculture staff are not afraid to tell the farmers of the province, through reports of their meetings in the public press, what they are planning to do, and what they are accomplishing.

Quality, did we say? Yes, the Prince Edward Island farmer is rapidly learning to put quality into his work and his goods. Quality leaders are leading quality men.

It is most encouraging to learn not only by reading but also by being in close personal touch with many of the best farmers in that province and also with the agricultural leaders and officers of the garden province how the work that is being done is receiving the hearty co-operation of the masses. Dairying is booming in Prince Edward Island and profits therein are being increased, due largely to the keen interest in Cow Testing Association work that is being carried on by Mr. Harvey Mitchell and his assistants.

The egg circle movement is also gaining in favor and is bound to accomplish the ends for which it was organized. The live stock work is steadily accomplishing its aims and so is the Horticultural work.

Perhaps, there is no department of the agricultural advancement campaign that is bringing the Island Province into more prominence than is the good seed propoganda.

Before the war broke out it was always a pleasure to the writer to visit the Island Province and learn at first hand what is being done. Since the enlistment for active service in defence on Home and Empire by so many of the Maritime Farmer's staff, those of us who remain at home have, in order to retain their positions for our boys until they return have redoubled our energies and are shouldering our share of the work in all departments from the Editor's chair to that of Printers' Devil. Consequently we have not been able to visit Prince Edward Island as frequently as heretofore. When our boys return we hope to resume our visits.

We cannot close these remarks without again pointing to the practical work and example set by Rev. Dr. P. C. Gauthier of Palmer Road. He is leading his parishioners not only in spiritual lines, but also in temporal matters. He is a winner. Would there were more clergymen like him, who would realize the importance and dignity of the farmers' calling and work with them and for them as he is doing.

THE RECENT SEED FAIR

The 13th Provincial Seed Fair was held at Summerside on Tuesday, Wednesday and Thursday, February 29th, March 1st and 2nd. The attendance was large, despite the zero weather and the absence this year of the Domestic Science and Handicrafts departments. Owing to the Agricultural Hall being now occupied by the 105th Battalion the usual lectures and other educational features were left out of this year's programme, the fair being held in the Magee building on Water Street—the best building available. Th exhibits, though not so numerous as last year were excellent in quality and especial praise is due to all concerned for the great success attained under the adverse and abnormal circumstances existing in this war time.

The formal opening took place at 2 o'clock on Wednesday afternoon by Hon. Murdock McKinnon, Commissioner of Agriculture, the President, Rev. Dr. Gauthier presiding.

Rev. D. Gauthier, in a short address, referred to the adverse conditions under which the Seed Fair labored this year, but pointed out that whatever short comings there might be the fair had done its good work in the past. It was, in fact, the first Short Course and from it had sprung every forward and co-operative movement throughout the province. This year the exhibits were here as in previous years, but there was no chance to show them to advantage. He regretted that Lieut.-Governor McDonald was absent through illness and called upon Hon. Murdock McKinnon to formally declare the fair open.

In doing so, Mr. McKinnon referred to the sacrifices being made at this time all over the Empire, which had also entailed the Agricultural Hall. All things considered, however, it was a good fair. In remarking upon the excellence of the exhibits he pointed out that whereas in the early days of the Provincial Seed Fair each year marked a great stride in the quality of the seeds shown, Prince County had now arrived at that state of perfection in this regard that the difference from one year to another is not pronounced. As our young men are now being taken from the farm and trained in bodies to make them efficient, so with agriculture it is by co-operation that the best results are to be obtained.

The President then called upon Mr. E. J. Vessey to come to the platform and publicly congratulated him upon winning three cups—taking eight first prizes with nine exhibits. Mr. Vessey was bumped and accorded three hearty cheers. Calls were also made for Mr. Peter Brodie, but the President, remarking that these two prominent farmers were both members of York Institute, excused him for getting on the platform as every one knew Mr. Brodie.

A meeting of the Co-operative Seed Company was held in the Salvation Army Hall in connection with the fair on Wednesday. The President, Rev. J. J. MacDonald, occupied the chair. At a previous meeting the Secretary had been instructed to get prices on the Banner Oats of the members. He reported that he got no satisfactory replies. A committee was then appointed to offer the product to local firms and eventually the Co-operative Seed Company sold its Banner Oats to Messrs. R. T. Holman, Ltd., at 60 cents per bushel as they came from the threshing outfit. A general meeting was then held, presided over by the President of the Seed Fair Committee, Rev. Dr. Gatuhier. He was asked plenty of questions regarding the sale of their lambs and he answered them all in a most satisfactory manner.

"ISLAND AAGGIE DE KOL"

Three year old Holstein heifer, bred by Lea & Clark, Victoria, P.E.I. Sire "Ida Rooker 2nd Vale." Dam "Aaggie Daisy De Kol. This cow gave 70 lbs. a day at Amherst, 2 months after calving. She was never beaten in her class in the show ring. Udder girth, 6 feet 2 inches.

Mr. Thompson, of the Live Stock Branch, then spoke on the care and marketing of wool. He told of the difficulties of the Canadian woolen manufacturers in procuring supplies and pointed out the possibilities of our own sheep industry in this direction. He stated that wool packed as directed by the Live Stock Branch was worth 10 cents a lb. more to the manufacturer than put up in the old way.

Mr. W. J. Reid told of the experiments last year and stated they would be ready to handle all the wool of the province this summer.

Mr. R. Robertson, one of the judges, says that, as was to be expected from the excellent exhibits shown here in previous years, the potatoes were of very superior quality. Although the number of exhibits was not nearly up to former years, almost all of the exhibits showed careful and skilful selections, in many cases being extremely hard to decide between, but very few were shown that might not be placed well up in a prize list. Evidently the exhibitors have recognized the fact that only a well selected and prime quality of exhibits need expect recognition. As usual, McIntyres formed the largest showing and many excellent exhibits had to go unplaced, also in the class of "A. A. V. named" some very good exhibits were still left after the prize ones were selected.

Prof. Tennant, one of the judges of Class C., tells us that the wheat exhibits in Class "C" were of fair quality. Some of the samples were not well graded and in a few of them wild peas were present in rather too large a number. Most of the exhibits in White Fife and White Russian were fairly pure, but the White Chaff was badly mixed. All the wheat was somewhat softer than in 1915.

The first prize white oats were plump and uniform in size. Some of the other entries were not well graded. All the samples showed unevenness of ripening.

Black oats were of exceptional quality, all the entries being good. The first prize lot was very plump and thin in the hull.

Most of the entries in barley were plump, well ripened and well graded.

There was a large number of entries in timothy seed. The first three lots of seed were quite free from weed seeds but were hulled slightly. Some of the samples were not well cleaned. A few entries had to be turned down on account of the presence of sheep sorrel. One entry contained ox-eye daisy. The color of a good deal of the seed is a little dark, due to bad weather conditions at harvest time.

The judges of the exhibits from the Fields of Standing Grain Competitions

(Continued on Page 381).

County Vice Presidents' Reports at the N. B. F and D. A.

Not only was the attendance at the recent annual convention of the New Brunswick Farmers' and Diarymen's Association, at Fredericton, the largest in the history of that body but it also excelled in the quality of the reports sent in by the various county vice-presidents. In other years it was not uncommon to hear the president call only a very few of them. Every county in the province with the exception of Gloucester and Victoria were reported for. Why there were no reports from these two counties we cannot tell—Victoria County farmers certainly gave a good report of themselves by their winnings at the Seed Fair held in the Market Building concurrently with the conveniton.

Following are the Vice-presidents' reports as submitted: —

ALBERT.

Members of the Farmers' and Dairymen's Association of N.B.—As I am unable to be present with you during the sessions of your meeting this year, I desire as Vice-president of the County of Albert to place my report before you as follows:—

The year 1915 is recalled as having an unusually wet and late Spring, which very materially interfered with seeding on late land. The summer was ideal for rapid growth, and was followed by one of the best autumn any country could desire, consequently farmers were able to do much fall ploughing and otherwise prepare for the coming spring.

In this county the banner crop was hay, which was stored in excellent condition, and all those who sold part of their crop secured good prices. All other crops were hardly an average yield.

Everything in the way of produce has had a very ready sale with exceptionally good prices.

From the live stock standpoint we ae steadily advancing from all points. It is a well known fact, by men who are an authority on the matter, that sections of Albert County produce as good beef cattle as are to be found in this province. This is due largely to the fact of the farmers standing to one breed year after year.

The general conditions in the county are in a satisfactory state, plenty of work at fairly good returns for all those that desire such. It is, however, anticipated by farmers that help will be difficult to secure for the coming spring on account of so many of our young men having joined the forces in the great fight, for the freedom and liberty of the world.

In short let me say Albert Co. is on the steady march to progressive advancement.

Respectively submitted,
LEWIS SMITH,
Lower Coverdale,
Vice-Pres. County Albert.

CARLETON.

The President, Officers and Members F. & D. Assn. of N.B. in the 40th annual session assembled; greeting. Owing to the fact that the Vice-Pres. for Carleton is today in the Balkans in the R.A.M.C. Service it is my pleasant privilege to supply a brief sketch of conditions in the county of Carleton from an agricultural standpoint.

Carleton, as a whole, responded generously to the campaign for Patriotic Production and, as a consequence, a large acreage of roots as well as the different grains were planted and sown. The cropping season was good and an immense amount of extra work consequent on increased seeding was carried on to completion in good season. The conditions continued excellent through haying, harvesting and digging seasons and during the fine fall weather much ploughing for season 1916 was accomplished.

Potatoes:—A large area was planted last season and though the yield was rather under average the price has ranged satisfactorily high, price for some time being more than normal.

Oats.—Carleton County acreage was a third—possibly more—than ordinary, and the crop harvested was extremely good.

Wheat.—As in other branches wheat acreage was increased and good returns of very good quality was harvested. Some smart in wheat and oats reported from some sections.

Turnips.—Normal acreage and regulation returns.

Barley.—Good yield and much more sown.

B. Wheat.—Small harvest of this grain and price about on a par with radium.

Hay.—Fair crop and good in quality. A good figure for this staple article and though immense quantities have been shipped Carleton is full of hay yet.

Pork and Beef.—Carleton sells annually large quantities of beef and pork and 1915 has been no exception. The farmers have realized good prices for these.

There are five societies in the county and all are doing something to assist their former members, but none are doing all that could and should be done. This fact is due mainly to the unaccountable apathy of the farmer himself when confronted with a proposition to unite his interests and strength with brother farmers and make an effort to get control of certain items that could be effectively and economically managed by the farmers themselves—as instance Fertilizer Feeds, Seeds and others might be mentioned. This is a fertile subject, bristling with points that might be taken up and discussed to advantage, but all that does not come within the scope of a county report. However, I may say in this connection that some of our societies are making a little headway. Centreville I am told is buying fertilizer ready mixed—for its members,—Woodstock, Glassville, F'ville and Hartland are buying for the second time the chemicals for home mixing. Speaking of what I am familiar I may say here that home mixing is here to stay. For our society I handled last year 80 tons of raw material and not one of our patrons ever home mixed before, and to tell the truth sometimes I was a little uneasy, but things went O.K. and when we called for orders this season we placed an order for 170 tons and could easily have placed four times that amount if proper financial facilities could have been worked out. On our business last season we sold to our patrons a highly satisfactory article at an average saving of $13 per ton and will do about the same this year. This matter of home mixing has been bitterly opposed by those interested in the sale and manufacture, but the Prov. Dept., chiefly through the untiring efforts of Prof. Durost and the officers of the pioneer association, N.B. Farmers Un., it looks mighty good right now for this—shall I say diversion from the old rut. Quite early at my suggestion, our society instructed me to open correspondence with other societies in the county with a view to effecting some kind of a purchasing agency in order to secure seeds for next season on a co-operative price basis. This in my mind would serve, if accomplished, in inaugurating that co-operative institution that will embrace all the farmers buying and selling operations and until that end is accomplished the farmer in this country will have pitifully failed of coming into his own. This little feeler fell flat. Needless to say I was hardly disappointed for I know the men I am dealing with, and let me say that as a business class, the average farmer is the most obtuse man on earth when the subject resolves itself into the line of practical business on the farm for the farmer. However the day will come when this will be different—and God speed the day.

Live Stock.—Large importations of live stock, pure bred of course, have been made by societies and private individuals during the year. In cattle, Holsteins and Durhams leading. In horses the Clyde predominates, and some good ones, both stallions and mares have been brought in. Percherons are also prominent. Very few horses of the light classes for service are noticeable. The price has been good for some time, but has dropped considerably during the last year, still a good horse will bring the high price when the man who wants him finds him.

Sheep in Carleton are a quandry, it is impossible to just tell whether this industry is coming or going. This is totally due to the scrub day nuisance, for our county should from natural conditions, be a grand sheep section.

The Dairy.—Dairying in Carleton is not what it should be, what with her broad and fertile fields and plentiful supply of water this county should be known the wide world over as a dairy section. As it is there are some good individual specimens in all breeds, Holstein possibly leading in favor, and on several farms are to be found fairly good equipment. This work so far as practical knowledge as to results is not up to date by any means, as very very few if any, make an effort to keep any data as to production or expense in connection with their milking herd. Two years ago through the interest of our energetic Sec., Agr. Mr. Doggett, I had the pleasure of being connected with the organization and successful working of a milk testing circle in our county. This created some curiosity, and no little interest, and was the first step I am pelased to flatter myself in introducing more practical work in this connection. This work for the last season was looked after by Mr. Kerr of the Ag. Dept. and will eventually work down to the proper basis of practical feeding and testing, and until that arrives we give as our private opinion that eight in every ten cows in Carleton will remain star boarders. The Babcock test and balanced rations are the ready means to put you wise to conditions in the herd.

An annual Seed Fair is conducted under the direction of the Soc. at Florenceville.

The third crop competition is fairly well patronized.

In closing I will say that our farmers have made elaborate preparations for another "patriotic production" crop and things look fairly good at present with hay potatoes and pork in the Zepplin class. Mr. President this is submitted with best wishes from my county for continued prosperity and increased production.

CHAS M. SHAW,
Hartland.

CHARLOTTE.

In Charlotte Co. the season of 1915 was not a very good one. The spring and summer were cold and dull. Hay was hardly up to the average, but as a rule well harvested. Grain was a good crop with splendid straw. Some wheat was raised and it turned out very well.

The root crop was poor, especially potatoes and turnips. Apples were a failure.

The Agricultural Societies are paying special attention to the improvement of live stock, particularly cattle. They have now quite a number of pure bred cattle in the county, including Holsteins, Ayrshires, Shorthorns and Jerseys.

In their stock we have a number of pure bred sires in the sheep and swine classes.

M. A. REED.

KENT.

Gentlemen,—

I beg to submit my report for 1915.

Season opened late and wet. Seeding except in dry and well drained ground was very late. Much of the grain crop was killed out with the excessive wet and was sowed too late to ripen properly. The hay crop was about the average and owing to favorable weather at cutting time was well cured. Wheat was a fair crop as it is generally sown on highest land. Oats was very much below the average. Root crop, especially potatoes was a very poor crop, due principally to the unfavorable spring, much seed rotting in the ground, and in the county (a few districts excepted)) the yield was very much below the average. Turnips were also a light crop, a heavy frost in August did much harm to garden stock, and to the buckwheat which was a very light crop.

Interest in live stock is increasing all over the country. Several good stalions are kept for services, heavy horses being the favorites.

Ayrshires, Shorthorns and Holsteins are our most popular breeds of cattle. The Agricultural Societies in general have breed Ayrshires which seem to be the favorite in the county. Sheep are increasing in number and in quality.

The operations of the Agricultural Societies are satisfactory and giving satisfaction to the farmers.

The wheat the Agricultural Department sold to the farmers gave good results almost everywhere, and if you permit me I would suggest that the Department purchase some oats and buckwheat for seed and distribute to the farmers . If the Dept. is not taking steps to help in this way a small quantity and poor quality of grain will be sown this spring.

Now about the best way of growing crops under the present conditions, I believe the farmers who have not enough barnyard manure to put a sufficient quantity on their grain and root lands they should buy some kind of commercial fertilizers suitable to their crop and soil. The extra crop they can thus raise will more than pay the expenses.

I have the honor to be,
Your obedient servant,
TELESPHORE ARSENAULT,
Vice-Pres. Kent County.

KING.S.

Mr. President, officers and members of the Farmers' and Dairymen's Association of N.B.

Your Vice-President for King's County begs leave to submit the following report:—

The past season has been one of prosperity for our farmers, notwithstanding the fact that the war cloud still hovers over us, and that many of our young men have answered the call to do their little bit for the flag we all love. This made a shortage of labor, causing many of our prominent farmers to cut down their stock and

reduce their operations to a certain extent. But the increase in the price of all farm produce has more than offset this.

The winter of 1914-15 will long be remembered as the winter when we had no snow, as in King's County we had only about one week's hauling on sleds, must of us had to haul our wood and ice on wagons.

But this state of affairs had one advantage, all preparation for cropping, such as the moving of manure and stone heaps was carried on before the frost was out of the ground.

The spring opened wet and on low ground some fields never became dry enough and were seeded in a condition that could not possibly yield a crop.

The damp season suited admirably the man on the dry upland, and he had a splendid crop of all kinds.

Dairying being our principle line the damp season gave us good pastures all through the season. We have to note an increased interest in the keeping of records which we take to be a good sign.

In dairying King's County still hold the premium position. In 1915 there were 25 cheese factories operated in New Brunswick and of this number 14 are located in King's County.

The total make of cheese was 1,165,-651 pounds and considerably over two-thirds of this was made in Kings. The total make of butter in creameries during 1915 was 258,659 pounds, and about one-third of this was made in King's. From the same county is also sent to the city of St. John a large quantity of milk and cream for table use, and cream for manufacture into ice cream. The four creameries operating in St. ohn are dependent for their main supply upon King's County dairy farmers. As compared with other years the pasture fields during 1915 were maintained in good condition. However, the rains that kept the pastures green were not opportune for some other lines of farm work, but the lesson only points to the wisdom of mixed farming.

We feel that our primary practice is still such as to make it cost us too much to produce a quart of milk or a pound of butter-fat.

By the application of information gleaned from the contesting work and improvement in field cropping we hope to reduce the cost.

The prices obtained for cheese and butter have been very high, altogether the season of 1915 was good for dairying.

That part of our county interested in the production of city milk reports a splendid year with a better dmeand through the summer months, than in past years.

Owing to the stricter enforcement of the regulation laid down by the Board of Health many farmers were compelled to remodel their stables or build new ones, thus adding to the comfort of their stock and making their care a much more plasant duty.

This which at first seemed a great hardship to some, will no doubt prove a benefit to all concerned.

But 1915 has marked a new era in our dairy work, the advent of the mechanical milker, a number of milking machines were installed during the past year and from all reports are giving their owners the best of satisfaction.

In crops the hay crop was heavy all over the county, clover was especially good. The weather for harvesting was not as good as we mig t desire but the most of the hay was harvested in fair condition.

In grain, wheat is not much grown. Oats are our principle crop, they yielded a heavy crop with a good stiff straw.

Buckwheat was a poor crop and in some cases was injured by early frost. Buckwheat meal is bringing at the present time four cents a pound. Potatoes owing to the poor demand in 1914 were not planted extensively, as a result some farmers have barely enough for their own use.

Those potatoes planted only yielded a fair crop. If our farmers wentpotatoe crazy in 1914 they went potatoe again in 1915.

Turnips in our dairy sections after hay are no doubt our most important crop, they are growing in favor each year. Last season owing to the wet weather the seed could not be planted as early as desired, consequently the crop was not as heavy. The warm damp season seemed especially favorable to the diseases which we note with alarm seem to become a more serious menace to our crop each year.

In that section of the county where my lot is cast the problem with us is how to dispose of large crops of marsh hay to the best advantage. We find that with a good crop of turnips we can use it to the best advantage.

If for instance a farmer has 30 tons of upland hay and 40 or 50 tons of marsh hay and straw and carries a stock of four or five horses and 25 head of cattle, 16 of which are milkers, he should be made to yield 1,000 bushels to the acre. If he has these cows come in mostly in the fall or early winter beginning in August and nearly all in by Nov. 11th, he is in pretty good shape for winter milk production.

It will take most of the upland hay for the horses.

He begins to feed his turnip tops in October and they will last about five or six weeks, he then can feed his milking cows a bushel a day, and the young cattle half that quantity till about April 1st, this along with the grain ration will furnish a large amount of milk at a minimum of cost, by April 1st his turnips and marsh hay are all fed and he will probably have enough clover hay to put them up to the time when they will get all they need in the pasture, any cows that have not satisfied him in the way of production will be in good enough flesh to go to the butcher. In past years on these marsh hay farms large quantities of middlings were fed in the effort to make milk it cost in some cases more than half the milk check too pay for the middlings by the feeding of a bushel of turnips the cost can be reduced to one-third, and in some cases less, this on a milk checque of $125 to $150 wounld be saving that would soon pay for the turnips. This is not something I have imagined, but is what is actually being done on some of these farms.

Less than a bushel a day does not seem to give results.

There is more than one reason why we need 1,000 bushels to the acre, it is easy enough to get it if there is any crop we can raise to perfection in King's County it is turnips.

We need 1,000 bushels, first because we need the turnips, second because it is an impossibility to raise 1,000 bushels and a crop of weeds. These two or three acres is the place to raise a fine crop of clean grain next year, and if we seed it it will raise a fine crop of clover the next.

Now on the disease question.

I will give you a hint on that John C. Titus of Bloomfield Station has had a lot of trouble with soft rot in his turnips. Two years ago his crop was scarcely worth pulling, last year he saved the manure for his turnip crop during the summer and early fall when he was feeding green oats and other feeds, besides turnips, he hept apart from the winter's manure, the result was a crop absolutely free from soft rot or other disease.

In fruits, apples are not much grown, though we have some very good orchards that are paying good profits.

The crop was light last season but was of good quality as the spray pump is much more in evidence.

In small fruits strawberries are the principal crop, these wintered well and yielded a good crop and sold at wonderfully good prices considering the crop.

There is a chance for much greater development along these lines as the demand seems to grow every year.

Where our berry growers a few years ago were glad enough to contract at 7 cts. today they consider a twelve cent average nothing to boast of.

Much interest was shown last season in the ground limestone experiments, it is perhaps too soon to look for results from this product which promises so much to our crop producers.

Now I would consider my report incomplete if I made no reference to the good work being accomplished by our Women's Institutes. This organization is doing much to relieve the drudgery of the work in our farm homes, and though we may sometimes have to put up with a late supper and are called upon to test many new fangled dishes.

We believe that the work is doing much to raise our work to a higher plane and will have a powerful effect on our most important crop, that of our boys and girls.

There is one point in regard to the matter which remains to be proven.

King's County has in the past turned out many clever and distinguished men, these are reported to have been raised on pancakes.

Will this new Institute diet have the same effect?

Now lest you think we are getting rich in King's County let us look for a minute at the other side of the page.

Our County has not yet recovered from the effects of the systematic canvas made three years ago by Western Real Estate agents, many of our farmers thinking that their time to get rich had come, hastened to draw from the bank the savings of many years and to hand it over to these fakers, if we judge by their works were not worthy to be classed with the sheep-killing dogs we hear so much about at these Conventions.

The result is some of them are taxed more today on their Western holdings than on their home farms. Quite a number have been compelled to mortgage, and the end is not yet.

Now why did these men invest their money thus? I say it was because they lacked confidence in their own business.

I believe this is a serious drawback. In many of our agricultural districts we fail to have confidence in our own business, the best business under the sun.

We need confidence first to carry through the work of today with enthusiasm. Confidence to plan carefully for tomorrom and next year.

Confidence to invest our own money and some of the other fellows if we need it in our own business.

Thus will we fulfil our duties to ourselves and to the nation which we form so important a part.

L. T. FLOYD,
Bloomfield, King's Co.

MADAWASKA.

To the President of the Farmers' and Dairymen's Association of New Brunswick.

Gentlemen,—

It is a duty for me to present my report to your Association for the county of Madawaska for the year 1915 as follows:—

Hay.—Crop very good. Saved in proper time and in good condition. About 200 carloads have been already exported. Price very satisfactory. Loose, $13.00; pressed, $15.00 per ton.

Wheat.—The crop has been very good for the quantity of seed confined to the ground, and the wheat distributed by the Agricultural Department has been a great success. The flour made with the said wheat has given just as good result as the best imported flour.

Oats.—Crop good and of a good quality. Quantity about the same as last year. Sold at 50c per bushel.

Buckwheat.—Not raised in large quantity now, but of a good quality.

Barley.—The farmers do not cultivate it on a large scale, but the crop raised is good.

Peas.—The samples I saw at our exhibition were of first class. I bought some for my own family, and it was impossible to get a better article outside. It is regretable that the farmers do not cultivate enough to export.

Beans. That line of seed is neglected and put the farmers in the obligation of buying for their own use.

Potatoes.—I am sorry to say that the crop has been about one-third of last year.

Turnips and other roots.—Fair crop, though not enough to export.

Pasture. Very good all over the county.

Colts.—There is a great change in that line. Still I have remarked that one importer alone sold in 1915, 75 draft horses, mostly mares, to our farmers.

Pigs.—Continuation of past year. Th farmers are satisfied to raise any for their own consumation. Not enough to hold the importation.

Poultry.—There is still a great amelioration in that line, as the egg importation has been considerably reduced during last year.

Sheep.—The farmers keep a large stock, and made quite an exportation at profitable price; but could still do better.

Cows.—The farmers have increased their stock considerably on account of the butter and cheese factories being in good operation during the summer of 1915. In 1914 four cheese factories produced 7,277 lbs. of cheese and two butter factories 4,9724 lbs., and the year 1915 has a considerable increase over that.

Apples.—Though the severity of our climate, our farmers had very good exhibits at the last fall fair.

General Remarks.—Last fall the Agricultural Societies have had their regular exhibition, which has been a success in some parishes and contributed considerably to stimulate the ambition amongst the farmers. Still I remark that since the terrible war has been declared, several farmers have made the sacrifice of their sons, to let them go to the front to defend the rights of our Mother land and our dear Canada. I hope they will come back victorious at the end and will be the heroes of our country.

J. A. BERNIER,
Vce-President for Madowaska.

NORTHUMBERLAND.

Mr. President, Members of the N.B. Farmers' and Dairymen's Association.

Gentlemen,—

The year 1915 was not a banner year for crops in Northumberland County on account of a very wet, cold spring, all crops suffered to a certain extent. Some wet land was not sown at all. Hay was a fair average crop. Oats, not much over half a crop. Wheat, while not sown to any great extent, was about an average crop. Potatoes, not a fifty per cent crop.

The growing of wheat has been greatly encouraged by the building of a splendid grist mill at Newcastle. We expect to increase the acreage of wheat greatly in 1916.

Great interest is being taken by the farmers of Northumberland in the Standing Field Grain and Root Competition, also in our local seed fair.

Mixed farming seems to be the most general system system carried on.

One branch of our business and not the least important one, I refer to the Sheep Industry, is, I regret to say, likely to be done away with. In fact a great many farmers have gone out of the sheep business altogether. This has been found to be a fairly profitable industry, but the dogs here, as elsewhere, are putting the sheep out of the county. This is a great pity we

(Cotinued on Page 398.)

THE MARITIME FARMER.

And Co-operative Dairyman
Registered Trade Mark

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

RATES FOR CASUAL ADVERTISEMENTS.

1 inch—First insertion 75 cents 2 inches—First insertion $1.50; inches—First insertion $2.25.

Contract rates on application.

Address letters and make all checks, money orders, postal notes, etc., payable to

THE MARITIME FARMER, or

Sussex, N. B.

Toronto Representative—J. Lester Davis, Miln Building 8 Johnson Street.

Montreal Representative—Dakers Cameron, St. Nicholas Building.

NOTICE TO ADVERTISERS.—Changes of ads. should reach this office one week before date of issue, in order to insure insertion.

RECEIPTS FOR FARMER SUBSCRIPTIONS

The Maritime Farmer, instead of giving you one receipt in the year for a paid subscription, sends you 24, or one every two weeks. You will find it on the GREEN COLORED LABEL on which your address appears. The date printed thereon is that on which your subscription terminates. If on payment of your subscription the date is not changed within two weeks, please notify us. No other receipt will be sent.

MARCH 21, 1916.

DATES OF ISSUE.

April 4-18
May 2-16
June 6-29

PROTECTION FOR FARM PAPERS.

Every farmer has papers of more or less value that should be placed where they cannot be lost. He has his deeds, insurance papers, tax receipts, and many other papers that should never be destroyed.

Some farmers have a safety deposit box in some bank in the city, others have these papers in a little tin box in the vault of the bank at which business of that nature is transacted; others have them carefully tied up and placed in a pigeon-hole or drawer in the desk at home, while others may have them and may not, depending on whether or not they can be found when wanted.

Some of our farmers are breeders of purebred live stock of different kinds. These are very valuable animals, all recorded, each one having a certificate of registry, which is in possession of the owner of the animal. The pure-bred stock breeder also keeps a herd register of his animals. The certificates of registry, pedigrees of animals nor yet recorded and the herd register are very valuable to the owner, and serious consequences would result should any of them be lost or destroyed.

We have visited many breeders of pure-bred live-stock and had occasion to consult the herd register and some certificates or registry. Generally we have found these very valuable papers kept in the desk. Very seldom do we find the farmers with a fireproof safe in the house.

It is very inconvenient for the pure-bred stock breeder not to have his certificates or registry at home. He must also have his herd register at home. How many of us stop to think what the actual loss would be if these papers and books should be misplaced or destroyed by fire? In many cases the record of many of these valuable animals would be absolutely gone and in consequence the value of the animal reduced to just what it would weigh out.

The item of outlay for a small fireproof safe, large enough for the farmer's needs, would not be large. It is just the same as insurance on your bulldings or live stock. Can any farmer afford to do without this protection, especially the man with a valuable herd of pure-bred live stock?

There is nothing that trains a boy or girl so much as a small piece of ground which they can handle as they see fit.—Prof. Saxby Blair.

* * *

We have listened to much of interest here tonight. Hearing these things, happy are you if you do them.—Shippy Spurr at the opening of the Lawrencetown Agricultural School.

* * *

Rennie's, the well known seed house, Toronto, suffered a severe loss on February 20th, when buildings and contents to the extent of $200,000 were burned. They announced in last issue that they have sufficient seeds stored at their Montreal Branch and in Toronto warehouses to fill their 1916 orders. Despite the fact that their loss occurred on the 20th they resumed filling their orders in the regular way on the 21st at noon.

* * *

Read Prof. M. Cummings' article on his experiments with Ground Lime Stone in the seasons of 1914 and 1915. It pays to use Ground Lime Stone at Truro. Have you ever asked your farm any pertinent questions as to its lime requirements? If you have not, 1916 will not be too early for you to begin. Ground lime stone is now practically within the reach of every farmer who wishes to use it.

* * *

At the recent meetings of the New Brunswick Farmers and Dairymen's Association, Prof. G. C. Cunningham told his hearers that thousands of dollars were lost every year to Maritime potato growers owing to their neglect to plant good disease free seed and also the neglect of not spraying for diseases that set in during the growing season. It pays handsomely to look after all the details of seed selection, treatment and spraying of the entire plot.

* * *

We understand a law is to be enacted in some of the neighboring provinces that will forever do away with the scrub stallion, as well as the unsound pure bred stallion before Father Time has marked off many more mile stones. The warning is out. What will the wily owners of these stallions do in the meantime? They will naturally try to unload their horses on unguarded buyers in the provinces where no such an act is in sight. Will you be one of the farmers who will bite?

* * *

We trust our readers in Carleton and adjoining counties are taking advantage of the short courses in Agriculture that are being held now in the Agricultural School at Woodstock. It is needless for us to repeat that the experience of men and boys who have attended agricultural short courses in the past is that they have been greatly benefitted. "Live and learn." The teachers in charge and your fellow farmers are always throwing out splendid suggestions. Suggestions that will very materially assist you in overcoming the difficulties that confronts you daily in the performance of your farm work.

* * *

He who does not live within his income will some day live without it.

* * *

If an apple diet has helped ex-President Taft reduce his weight, as he says it has, it is no more than we expect of the apple. It only makes good the old saying: "An apple a day will keep the doctor away."

* * *

The Maritime Farmer will not knowingly publish an advertisement of an unreliable firm, nor one which does not do exactly as it advertises. Any subscriber who finds that an advertiser does not do os he promises in his advertisement will confer a favor by telling us his grievance.

* * *

How long are the owners of scrub sires going to dictate the rate of progress that will be made in live stock breeding in the Maritime Provinces? Some people due to sheer cussedness, never castrate their male stock but permit them to run at large, much to the annoyance of their more progressive neighbors who are trying to breed pure bred stock. Scrub sires running at large have often caused a bad feeling between neighbors. This condition ought not to exist. A hard and fast law re scrub sires running at large is badly needed.

* * *

A resolution re scrub bulls was passed at the 1915 annual meeting of the N. B. F. & D. A. What became of it we do not know. Our own opinion is that the wording was too drastic for any intelligent body of legislators to tackle, and we suppose it therefore died a natural death. A law can, however, be enacted that will not be too drastic, and yet be capable of a scope wide enough to protect the progressive stock breeder without the necessity of unpelasant relations with his less progressive neighbors.

* * *

What about the inauguration of a drainage system for your farm during the coming summer? While you are at work with your seeding operations is a good time to mark the wet spots that occur in your fields. A good way to do this is to drive a stake in the centre of each wet spot. Plan your drainage so that either a main or a lateral will traverse these spots. If the work is well done your fields will be, in the future, ready for seeding much earlier than they used to be. Drainage lengthens the growing season.

* * *

In less than half a hundred days the farmers of the Maritime Provinces will be in the field again preparing for the seeding of the 1916 crop. Just as soon as the seeding season opens all hands will be busy and no one can well afford to cease operations in order to get some machine or another repaired. The wise farmer sees to it that every bolt is tight, that every part is in place and where new parts are needed that they are procured and put in place before the busy season opens. The growing season is quite short in Maritime Canada. We need every day of it to produce maximum crops. Let us not shorten our yields by gross neglect of some farm implement.

P. E. Island's Quality Reputation.

(Continued from Page 377).

state that the quality of the exhibits was superior. In wheat the samples were well graded, but there was considerable smut and one sample contained a grain of barley and another of black oats.

In banner oats there were thirteen competitors. The first prize sample was almost perfect—large, uniform, plump, of excellent color and free from any impurities. There were all gradations between this and the poorest sample, which was bright but not sufficiently graded. All the exhibits in this section were particularly good. There were very few exhibits of barley, but they were all good.

Prize List

CLASS A.—Open to members of the Canadian Seed Growers' Association.

White Fife Wheat—1, W. H. McGregor, Central Lot 16.

White Russian Wheat—1, Thomas Waugh, Wilmot; 2, Alex McFarlane, Bedeque; 3, James E. Murphy, Augustine Cove.

Banner Oats—1, W. H. McGregor; 2, Jas. E. Murphy; 3, Alex. McFarlane; 4, Thos. Waugh; 5, Michael McKenna, Newton; 6, Riverside Farm, Bedeque; 7, Judson Simpson, Belmont.

Barley—No first awarded; 2, Thos. Waugh.

Class A., Section 4, Banner Oats—1, Peter Brodie; 2, Melville Bradshaw; 3, Summeesidr Seed Centre.

CLASS B.—Open to exhibitors in standing fields of grain competition, who are not eligible for competition in Class A.

White Russian Wheat—1, Horace Wright, Bedeque; 2, Geo. McFarlane, Fairview; 3, D. B. McDonald, Bedeque; 4, A. J. Hynes, Cherry Valley.

White Fife Wheat—1, E. J. Vessey, York; 2, Wm. G. Taylor, Wilmot.

Wheat (any other variety)—1, G. W. Wood, Hazelbrook.

Banner Oats—1, E. J. Vessey; 2, Calvin W. Wood, Southport; 3, A. J. Hynes; 4, Fred Bulman, Rustico; 5, Horace Wright; 6, Roy MceLan, Central Lot 16; 7, Rev. J. J. McDonald, Kinkora; 8, Geo. McFarlane; 9, James G. McLean, Central Lot 16; 10, Samuel J. Waugh, New Annan; 11, Wm. G. Taylor, Wilmot; 12, Artemas Clark, N. Bedeque; 13, James Gorman, South Melville.

Barley (six rowed) — 1 Horace Wright, Bedeque; 2, Albert Schurman, Central Bedeque.

CLASS C.—Open only for grain that has not been inspected in the field and not eligible for Class A or B.

White Fife Wheat — 1, Horace Wright; 2, S. M. McEwen, Summerside; 3, Riverside Farm.

White Chaff Wheat — 1, Walter Green, Sumerside; 2, Calvin W. Wood; 3, Horace Wright; 4, Calestine Perry, DeBlois; 5, F. C. Perry, DeBlois; 6, A. B. Dickieson, New Glasgow.

White Russian Wheat—1, E. J. Vessey; 2, Philip McNally, Summerside; 3, H. W. Compton; St. Eleanors; 4, Wm. G. Taylor; 5, Riverside Farm.

Oats (White Banner or Danish)—1, Geo. W. Wood; 2, A. B. Dickieson; 3, James Clark, N. Bedeque; 4, Geo. McFarlane; 5, Albert Schurman; 6, Alfred Simpson, St. Eleanors.

Oats (any other variety)—1, E. J. Vessey; 2, Peter Brodie; 3, Geo. W. Wood; 4, Calvin W. Wood; 5, J. H. Arsenault, Urbainville; 6, Walter Green.

Oats (Old Island or Black Beauty)—1, Peter Brodie; 2, Peter N. Porier, St. Louis; 3, E. J. Vessey; 4, Calestine Perry; 5, A. B. Dickieson.

Beans (colored)—1, Horace Wright; 2, J. H. Arsenault; 3, Calestine Perry; 4, D. B. Tanton, St. Eleanors; 5, John M. Peacock, Lower Bedeque.

Fodder Corn—1, Albert Schurman; 2, Peter Brodie.

Garden Corn—1, Horace Wright; 2, Henry Moyse, Central Bedeque; 3, Fred Moyse, Central Bedeque; 4, John Rose, Chelton.

Clover (Alsike)—1, Albert Schurman.

McIntyre Potatoes—1, E. J. Vessey; 2, Peter Brodie; 3, Pope Cook, York; 4, T. B. Montgomery, Travellers Rest; 5, Thos. Stavert, Summerside; 6, Jas. E. Murphy; 7, Malcolm Kelly, Traveller's Rest.

Potatoes, Dakota Reds—1, E. J. Vessey; 2, Peter Brodie; 3, Pope Cook; 4, Thos. Stavert; 5, Reginald Compton; 6, Celestine Perry.

Potatoes, Rose Type—1, E. J. Vessey; 2, Peter Brodie; 3, Thos. Stavert; 4, J. H. Arsenault; 5, T. B. Montgomery; 6, Richard Clark.

Potatoes, Green Mountain—1, Peter Brodie; 2, E. J. Vessey; 3, J. H. Arsenault; 4, Thos. Stavert; 5, Reginald Compton; 6, Calestine Perry.

oPtatoes, any other variety—1, Pope Cook; 2, Peter Brodie; 3, E. J. Vessey; 4, John Rose; 5, Reginald Compton; 6, A. D. Murray, St. Eleanors.

Eschalots—1, J. H. Arsenault; 2, Melville Johnston, Central Bedeque.

Turnip Seed, Swede—1, Horace Wright; 2, W. H. McGregor; Central Lot. 16; 3, A. D. Murray; 4, James E. Murphy; 5, Percy Marchbank; 6, Thos. Stavert.

Mangel Seed,—1, John M. Peacock; 2, Thomas Stavert.

Cabbage Seed—1, James E. Murphy; 2, Amant Gallant, Mont Carmel; 3, Horace Wright; 4, Edward Hogg, Sher-

Collection of Island Weeds (pressed)——1, Miss Laura Fraser, Belmont; 2, Miss Georgie Matthews, Summerside; 3, Belmont School; 4, Marie Compton, St. Eleanors.

Barley, two rowed—1, E. J. Vessey; 2, Calvin W. Wood; 3, Horace Wright; 4, Geo. W. Wood; 5, J. H. Arsenault; 6, Judson Simpson.

Barley, six rowed—1, E. J. Vessey; 2, James E. Murphy; 3, Walter Green; 4, Wm. G. Taylor.

Buckwheat, Silver Hull—1, E. J. Vessey; 2, James E. Murphy; 3, Calvin W. Wood.

Field Peas—1, Walter Green; 2, Riverside Farm; 3, John M. Peacock.

Col. Island Weed Seeds—1, Henry Moyse, Central Bedeque; 2, Fred Moyse, Central Bedeque; 3, Alberta Dunn, St. Eleanors; 4, St. Eleanors School.

Flax Seed—1, Geo. McFarlane; 2, E. S. Vessey; 3, Judson Simpson.

Col. Garden Seed—1, Fred Moyse; 2, Henry Moyse; 3, Fannie Arsenault; 4, Mrs. A. McLeod, Rose Hill.

Timothy Seed—1, Geo. McFarlane; 2, Geo. A. Jeffrey; 3, E. J. Vessey; 4, John W. Profit; 5, Artemas Clark; 6, Alex McFarlane.

Mr. E. J. Vessey, of Little York, won the three silver cups. Two of these now becme his sole property and the other has to be won by him once more to be held for good. They are as follows:

Silver Cup, donated by Hon. John Richard—Best simple 2 bushels oats, White Banner or Lignowo. Best sample Wheat, White Fife or White Russian. Best sample Barley, 6 rowed. To be grown by exhibitor and open to members of Farmers' Institutes only. Cup to be won three times (not necessarily consecutively) before becoming the property of the exhibitor. Won also in 1914 by E. J. Vessey.

Silver Cup donated by F. R. Heartz, Charlottetown—Best sample, 2 bushels oats from fields that competed in the fields of standing grain competition. Cup to be won three times (not necessarily consecutively) before becoming the property of the exhibitor. Won also in 1914 and 1915 by E. J. Vessey.

Silver Cup, donated by Hon. Charles Dalton—For the largest and most creditable number of exhibits in sections 1 to 23 Seed Division. Won also in 1914 and 1915 by E. J. Vessey.

List of Awards at the New Brunswick Provincial Seed Fair.

The following is the complete list of awards at the New Brunswick Provincial Seed Fair:

Wheat

White Fife—1, E. L. Hume, Florenceville; 2, Basil Kirkpatrick, Florenceville; 3, A. R. Gorham, Gorham's Bluff; 4, Donald Innes, Tobique; 5, Henry Gordon, Chatham; 6, Bertram Goodspeed, Penniac, and 7, Leslie Sharp, Keswick.

White Russian—1, Joseph D. Daigle, McLeod's Mills; 2, Henry Gordon; 3, Edward Jarvis, Stanley; 4, Walter Payne, Lake Edward, and 5, William Hood, Stanley.

Red Fife—1, J. W. Stevenson, Gladstone; 2, T. A. Davis, Sussex; 3, Henry Gordon, and 4, Thomas Stevenson, Gladstone.

If a stud or bolt should break off in a casting so that a pipe wrench or toher tool will not reach it, it can be removed by drilling a hole in it and driving into the hole the three-cornered handle of an ordinary file. The corners will grip the bolt and a monkey wrench applied carefully to the file will unscrew the bolt.

NEW TOMATO "ALACRITY"

Developed by experts at the Central Experimental Farm, Ottawa.

EARLIEST OF ALL RED TOMATOES

ALACRITY produces a closer compact vine, set quite as freely with fine smooth tomatoes which are usually ready to market ten days earlier than any other strain.

The entire crop can be gathered generally in about three weeks from the time the first fruit ripens.

ALACRITY is undoubtedly the very best earliest scarlet fruited tomato.

HORTICULTURE.

Experimental Work in Top Grafting and Control of Apple Scab in the Lingley Demonstration Orchard 15.

By A. G. Turney, Provincial Horticulturist.

So far all attempts to control the apple scab in this orchard had failed and it appeared that the greater degree of coolness and humidity produced in that locality by the proximity of the Bay of Fundy was unfavorable to, if not absolutely prohibitive of, the profitable production of varieties of apples so susceptible to the scab as Fameuse and McIntosh.

It seemed advisable that the Department should continue to operate this orchard for the following reasons:

(1) To further determine the factor of climate in its relation to the control of apple scab in that and similar districts on varieties such as Fameuse.

(2) That some of the most healthy Fameuse trees may be top grafted to some variety less susceptible to scab, a similar number of trees being left as checks, so that information may be procured as to the amount of fruit produced in each case, and as to the cost of and possibility of changing unprofitable trees into profitable ones by this means.

(3) To determine the part played by scab infested twigs of the previous season's growth in producing the spring infection.

Mr. R. P. Gorham, Assistant Horticulturist, was placed in charge of this work and he supplied the data for the following report of the various operations:

Cost of Top Grafting Old Apple Trees:—The prevalence of apple scab in this orchard and the seeming impossibility of bringing it under control by spraying led the owner to decide on top working the Fameuse over to some other variety. As the trees were about 45 years old and of large size it seemed a good opportunity to obtain information on the actual cost of top grafting this class of trees in New Brunswick. Accordingly the work was planned to cover a period of three or more years as follows:

1. Selection of certain healthy trees for top grafting.
2. Selection of trees of corresponding age and vigor as checks.
3. Keeping records of the cost of labor and materials used in the grafting of these trees.
4. Keeping records of the fruit harvested from both grafted and check trees.

Twelve trees were selected for experimental work. These were in pairs in different parts of the orchard but corresponding as nearly as possible in size of tree, spread of head and general vigor of growth. One tree of each pair was grafted to Bishop Pippin, working over about one-third of the branches the first year, and the other three was left untouched as a check. The trees were marked by driving stakes in the ground beside the trunks and marking on them letters and figures—one leter for each pair of trees. The first in each case being the grafted tree, the second a check tree. The work of grafting gave the above data:

Tree No.	Time Cutting Stubs.	Time Cutting Scions	Time Setting Scions.	Time Waxing Stubs.	Time Total
A.1. 15 stubs on tree	15 Min.	8 Min.	20 Min.	20 Min.	63 Min.
B.1. 10 stubs on tree	8 Min.	5 Min.	10 Min.	12 Min.	35 Min.
C.1. 21 stubs on tree	20 Min.	10 Min.	25 Min.	25 Min.	80 Min.
D.1. 11 stubs on tree	10 Min.	3 Min.	15 Min.	15 Min.	43 Min.
E.1. 12 stubs on tree	10 Min.	6 Min.	17 Min.	20 Min.	53 Min.
F.1. 11 stubs on tree	3 Min.	2 Min.	15 Min.	12 Min.	32 Min.
80 stubs	66 Min.	34 Min.	102 Min.	104 Min.	306 Min.
Average time in Minutes per stub for each operaton	66-.8 25	34-.425	102-1.266	104-1.30	306-3.816
	80	80	80	80	80

Thus the time required in grafting is about 3.8 minutes per stub. With labor at 30 cents per hour this works out at 1.94 cents per stub exclusive of wax and scions.

The 80 stubs required 3¼ pounds of grafting wax, made in the proportion of:—

4 lbs. rosin costing ...	$ .36
2 lbs bees wax costing	1.20
1 tallow costing	10
7 lbs.	$1.66
Melting and working wax, one hour	.30
	$1.96

Total cost of one pound of wax, 28 cents.

Thus the 3¼ pounds of wax used cost 91 cents, or 1.13 cents per stub.

The scions in this case did not cost anything. but charging them at the usual price set for them in New

COWAN'S COCOA
"Perfection Brand"

A Cocoa that is brimful of nourishment containing the beautiful aroma of the finest cocoa beans skillfully blended.

Years of experience in the cocoa trade has produced in our "Perfection" Brand the finest cocoa in the world.

As a liquid food its value is unsurpassed.

At a very small cost it may be bought anywhere — and remember it is the economical food to-day.

Eureka

Potato Planter

Catalog sent free

The Eureka line of Potato Planters is the largest manufactured. This machine takes only *one* man to operate it. That means less trouble and expense for *you*.

Opens the furrow—drops the seed any distance or depth required—puts on fertilizer (if desired)—covers up—marks for next row. Always accurate and automatic.

It's an easy machine to operate. The steel and malleable iron construction mean lightest possible weight and increased life of machine. Your repair bill will be practically nothing. Plants uniform depth at *all* times because plow is directly under the axle. Dropping mechanism in plain view of driver. Does not injure seed.

We supply planters in three sizes, for one or two rows—with or without Fertilizer Attachment.

For 16 years the Eureka Potato Planter has been successfully used throughout the world.

We also make Eureka Potato Cutters and the Eureka Mulcher and Seeder—a mulcher, smoothing harrow, cultivator, weeder, seeder.

FROST & WOOD CO., Ltd., St. John, N. B.

Eureka Mower Co.

Box 745

Utica, N. Y.

Brunswick of 50 cents for 100 sticks, each stick making about three scions, the cost amounts to .32 of one cent per stub. Hence the total cost per stub is as follows:

Labor	$1.90
Scions	.32
Wax	1.13
	$3.35

which, multiplied by 80 gives $2.68 as the total cost for the six trees, or an average cost of 45 2-3 cents per tree.

To this must be added the cost of hauling the brush from the orchard, one man and a horse for one hour at a charge of 35 cents, which equals 5 4-5 cents per tree, bringing the total cost up to 51½ cents per tree.

During the summer these trees were given the same treatment as the others in the orchard, that is, cultivation between the rows during June followed by the sowing of a cover crop. Sprayings were applied on May 10, May 21, June 3, June 17, July 13 and August 14.

The crop which was harvested in October, showed in several cases larger apples and apples of better quality on the trees that had been grafted than on those left as checks. A few particularly susceptible trees, however, showed more scab on the grafted trees than on the ungrafted. For comparison of the yields the crop was measured as picked and a general price of $2.00 per barrel, three run, set. (The actual price at which tree run Fameuse were being sold in other orchards). The yields are given in the following table. The Fameuse in 1915 are designated by the figure 1 after the letter. Check trees, of as nearly as possible the same size and vigor are designated by the figure 2 after the letter.

		Yield.	General Quality.	Value.
Tree	A.1...	2 1-5 bbls.	Poor.	$4.40
,,	A.2...	1½ bbls.	Poor.	3.00
,,	B.1...	¾ bbl.	Good.	1.50
,,	B.2...	1½ bbls.	Good.	3.00
,,	C.1...	1¾ bbls.	Good.	2.00
,,	C.2...	2½ bbls.	Poor.	5.00
,,	D.1...	2 bbls.	Good.	4.00
,,	D.2...	1 4-5 bbls.	Good.	3.60
,,	E.1...	½ bbl.	Good.	1.00
,,	E.2...	1½ bbls.	Good.	3.00
,,	F.1...	½ bbl.	Good.	1.00
,,	F.2...	1 bbl.	Good.	2.00

The six grafted trees produced 7 7-10 bbls. valued at $15.40.

The six check trees produced 9 4-5 bbls. valued at $19.60.

This gives a difference in value of fruit produced of $4.25 between the grafted and check trees, and if we attribute this loss of $4.20 to the removal of bearing wood from the grafted trees, then we must add that amount to the cost of the operations. This amounts to a cost per tree for decreased productiveness of 70 cents which. added to the expense of the previous operations, makes the total cost for one season in top working these trees to another variety to $1.20½ per tree.

On June 24th an examination showed that 289 scions or 72.6% of the number inserted were growing, and 99 were not really growing. Practically all the scions showed signs of life, but a number of them had not mande any distinct growth.

I believe that this is a valuable work, well started, and one that we should carry to a conclusion.

Control of Apple Scab.—On page 39 of the Horticultural Report for 1913, mention was made of the work of W. J. Morse and W. H. Darrow of the Maine Experimental Station on the spread of apple scab. Their work showed that in that State at least it was possible for the spores of the apple scab fungous from affected twigs to germinate and set up new cases of the disease after passing the winter on the trees. The logical conclusion from these results was that if affected twigs could be removed and destroyed before the spores had a chance to germinate, at least a little would be accomplished toward preventing the spread of the disease in spring. With the object of trying this out on a small scale, two trees in the Lingley orchard which were particularly susceptible to apple scab were selected, one a St. Lawrence, the other a Fameuse, both about 45 years old. Three years' work in the orchard had shown that, despite the most thorough spraying given under the supervision of the Horticultural Department, these two trees had never porduced any marketable apples, while the owner stated that never within his memory had they produced any clean fruit. The fact that these two trees were isolated from other susceptible trees by being in a block of Alexander and Duchess made them more favorable for experimental purposes.

After the ordinary spring pruning had been given in the orchard, these trees were gone over carefully with a pole pruner and all of the twigs of the past season's growth were trimmed off, cutting in every case possible below the ring marking the beginning of the growth. The trimmings were then raked together, removed and burned. Afterwards the trees received the same treatment as the remainder of the orchard. As many as possible of the leaves were raked up and burned, cultivation was carried on during June and six sprays were applied during the season. It was the off year for the St. Lawrence tree and it only were of large size, well colored and free from scab. The Fameuse tree bore 4½ barrels of apples, 85% free from scab, and all of good size. It was noted that all the scabby apples on this tree were nearly all on one branch that interlocked with the branches of another tree, and the apples were consequently in the shade.

While the cleaning up of the leaves in the orchard and the sprayinging of the trees pruned, as well as the others not pruned. makes it impossible to say that the results obtained were entirely due to the removal of the twigs, yet the facts that those two trees were the most susceptible in the orchard, that for three years previously they had been sprayed thoroughly without producing any marketable fruit and

DAIRYING.

How a good Farmer makes Money During the Winter Months.

In nearly all business enterprises there are slack months during the year in which the merchant, manufacturer, farmer and others do not make a profit.

These dull months come at certain regular periods and give the business man no end of worry and trouble. There are, however, a few men in every business who know how to take care of these periodical depressions, and they stand out as the most thrifty and prosperous.

As a rule a business depression comes to the farmer during the winter months (October to March), and he is 'at sea" to know what to do to make profits. It is very discouraging to him to see his hard-earned summer money spent daily for the necessities of life, or else to have his savings cut down by some unlooked for expense. If he is not so fortunate as to have savings, he may be compelled to go into debt.

Many of the good farmers in every community have been up against this proposition, and how to make money during the winter months is often asked. There may be several answers to this question, but one of the most practical is, 'Follow Winter Dairying."

The busines farmer of today is giving the various branches of agriculture, soils, grains, fruits and livestock very careful study. He is a general farmer, so has all the branches of agriculture to consider. He knows soils, grains and fruits must be closely observed during the summer, and that livestock can be handled to good profit during the winter.

He also knows a good dairy cow is the most economical producer of human food on the farm. He calls a good dairy cow one that will average a pound of butter-fat daily or 365 pounds yearly. He knows there is greater demand for butter-fat during the winter months, and the price will be from 5 cents to 10 cents higher than it is during the spring or early summer months. If the price is 20 or 25 cents per pound for butter-fat during the flush of the year, it generally is 30 to 35 cents during the winter months.

According to experimental data it takes from ten to fifteen minutes daily to milk and care for a cow that gives an average of 1 pound of butter-fat per day, and by producing this butter-fat during the winter months he will receive at least 30 cents per pound, or a gross income of $1.20 per unit hour labor for milking, to say nothing of the value of the skim-milk, or of the calf, and the manure which he uses as fertilizer to grow better crops.

Dairy Work in Winter Shows Best Returns

Knowing there is no other branch of agriculture that will give him such handsome returns per unit hour during the winter he becomes enthusiastic, builds a silo, uses silage for feeding his cows, and has a herd of ten to fifteen cows instead of one to five.

Instead of keeping "scrub" cows and a poor grade "scrub" sire for breeding purposes, he keeps a pure-bred dairy dairy sire and weeds out his poorest cows by applying the Babcock butter-fat test to their milk.

He gives steady employment throughout the year, and thereby obtains the best of labor, because short-time positions do not attract the best kind of help. Due to this fact his fall calves receive the best of care and attention, where, if the calves came in the spring, the busy time on the farm, they would be neglected.

Use of High-Grade Separator Most Essential in Winter

He knows that the butter-fat exists in milk in very small fat globules, and these fat golbules are generally the smaller and of the greatest number during the winter months. He also knows cold weather will reduce the temperature of freshly drawn milk very quickly, and knowing these facts he is desirous of reducing the butter-fat loss in his skim-milk to a minimum, so he uses a good cream Separator to separate his milk.

There are many farmers who are milking one to five cows during the winter months and who do not appreciate the real value of dairying to the other branches of agriculture. They are the class of farmers who do not make money during the winter months, because they follow wasteful methods and lose large quantities of butter-fat. They are feeding butter-fat, which is worth $600 per ton, in their skim-milk to their calves and pigs, when they could get the same results if they would add the vegetable fats in corn, oil meal and other concentrated feeding stuffs worth $60 a ton, to their warm, freshly separated skim-milk. It will be genuine economy on their part to buy the best cream separator made, and reduce their butter-fat losses to a minimum.

Savings Effected by a Good Cream Separtaor

From our practical experience with nearly 2,000,000 users of the Cream Separator, a modern centrifugal cream separator will save the farmer at least $15 per cow per year over the gravity or hand-skimming system, and about one-half that amount over the cheaply constructed centrifugal cream separator. In other words, a No. 10 size machine that will save $15 per cow per year on a $65 investment will be giving the farmer a minimum return of over 23 per cent on his investment on each cow for every year of the separator's life, and if he has five cows he will make $75 yearly, or $10 more money than the original cost of the separator over the gravity system of separation.

If the farmer who is using the gravity system of separation or a cheap centrifugal separator will discard it and use our System of Separation he will make profits. This is what the aforesaid successful farmers have done. In other words, they thoroughly analyzed their failures, which pointed out to them the "reason why" and indicated the way that led to their final success.

It Doesn't Pay to Wait

By far too many farmers make the most serious mistake of deferring the purchase of a cream separator until late spring when the cows are in full milk. No greater economic mistake can be made. During the winter months the loss by impractical separation is excessive. This loss can only be stopped by the use of a separator. The fact that the amount of milk is small is a poor excuse for throwing high-priced butter-fat to the calves and hogs. It is the daily saving, regardless of seasons, which determines the yearly profit.—J. D. Jarvis, Advisory Expert, De Laval Department of Dairy and Creamery Improvement.

Stop that weary waste of Time and Money which goes with Hand-Milking!

You can milk more cows in a fraction of the time—you can increase the average yield—improve the purity of the milk—and do without extra hired help—by using the

EMPIRE MECHANICAL MILKER

One man with a small "Empire" outfit, consisting of one double unit, can milk ten to fifteen cows in half an hour. One man can operate two double units.

The action of the "Empire" is just like that of a sucking calf—is soothing to the most "fidgety" cow—usually increases the flow—and protects the milk from dirt and germs.

And, what is perhaps most important of all, the "Empire" Mechanical Milker solves the problem of hired help and makes you practically independent.

Interesting literature will be sent you on request. Write Dept. L 32

The Grading of Cream in Cream Gathered Creameries.

(By W. A. MacKay)

The question of quality is of prime importance in all food products and in no food product is it more essential than in creamery butter. This is becoming more important yearly as the quantity of creamery butter manufactured is incerasing, and our butter will have to compete in stronger markets with butter from the other Provinces and other countries. Consequently the highest possible quality has got to be manufactured.

To have the highest quality of butter the creamery man must have the finest quality of cream. Regulations are now being enforced whereby the creameries have to be kept up to a standard of efficiency whereby the patron has the assurance that the best quality of goods can be manufactured; but without the best quality of cream, the butter maker is helpless. Consequently cream grading or paying for the cream according to quality.

It is not fair that a patron who provides ways and means and keeps his cream in a nice, sweet, and well flav-

cred condition, should receive a premium on it over and above the patron who is negligent and careless and allows his cream to become sour, not cooled or well stirred and 'off" flavor, so that it will not make the finest quality of butter? It is to overcome this unfairness that we should adopt "cream grading."

History of Cream Grading in Canada

Cream grading in Canada started in Alberta, and has since been adopted in all the Western Provinces. The result is that the quality of the butter in these provinces has improved wonderfully during the last few years and is now taking its place among the finest butter in the world. The Dairy Superintendents from these Provinces, report as follows:

"The fact of the matter is that, generally speaking, so much good advice has been handed out to creamery patrons everywhere that they know pretty nearly what they ought to do to supply the right quality of cream. It just takes a little incentive, such as the pay for quality principle provides, to bring them into line.'—Marker, of Alberta.

"Cream grading is just to the producer. Grading was comemnced in the co-operative creameries and one of the first testimonials to the success of the system is the fact that it has been adopted, as far as I know, by every privately owned creamery operated in the Province."—Prof. MacKay, Saskatoon, Sask.

"Grading is just and it certainly is a great factor in improving the quality of the cream. As our creameries are operated on the same basis as yours in Nova Scotia, I see no reason why you should not introduce and successfully carry out the grading system. Get your creameries to stand loyally by each other."—Prof. J. W. Mitchell, B. A., Manitoba Agricultural College.

Cream Grading in Nova Scotia was first proposed by Mr. George H. Barr, Chief of the Dairy Division at Ottawa, at the Annual Meeting of the Farmers' Association in 1914 and at the Annual Convention of the Dairymen's Association in January, 1915, where he recommended the adoption of it as just in all the cream gathered creameries.

Nothing was done, however, in a general way until it was tried out for a season as an experiment in the Government Demonstration Creamery at Baddeck, C.B., and the results of the seasons' experiment have been so successful in getting a better qaulity of cream that after the report was presented to the Annual Convention of the Dairymen's Association in January, 1916, a resolution was unanimously passed recommending that all the creameries in the Province adopt the system of cream grading beginning with the Spring of 1916.

The system as recommended for the present is two grades, a premium of two cents per pound being paid for grade No. 1, over grade No. 2. Anything below grade No. 2 will be refused. The cream will be graded at the weigh stands by the weighman in charge; it is recommended that grade No. 1 be indicated by a white tag on the can, and grdae No. 2, by a yellow or some other color of tag.

Definition of Grades. No. 1 Cream sweet, of good flavor, smooth and containing not less that 20% butter fat.

No. 2.—Cream that has soured, flavor not good, not smooth or containing less than 20% butter fat.

The aim of the Department of course is to have as much as possible in Grade 1, and eliminate grade 2 as quickly as possible. It is comparatively easy to have all Grade 1 cream, if it is delivered at least three times a week during the summer weather and twice a week during the balance of the year. The following suggestions if followed out, will assist materially in always having grade 1 cream.

1. Separate milk as quickly as possible after milking, aiming to have your cream test about 30% butter fat. If using deep setting cans, keep the cream rich as possible. Don't try to send cream off shallow pans.

2. Cool the cream as soon as possible to below 50° if possible and at least below 60°. Cool by setting in cold water or water and ice. It is practically impossible to keep cream in the average cellar without cold water surrounding it.

3. Don't add fresh cream to the old until it has been thoroughly cooled.

4. Stir the cream regularly at least twice a day, using a saucer shaped stirrer. The cream after being cooled can be kept in the can in which it is to be shipped.

5. Keep everything clean; wash the separator after each run; and scald and air everything with which the cream comes in contact. The liberal use of wyandotte or some other cleanser is recommended.

Cream grading commences at your creamery on ..... and continuously thereafter. We ask for your co-operation to have nothing but the finest grading of cream and butter.

McGILL ST. MONTREAL

Clover Seed Growing in Nova Scotia.

Last summer the Nova Scotia Department of Agriculture, on the advice of S. J. Moore, Dominion Seed Inspector, offered to place a clover huller at the disposal of farmers in North Colchester and Pictou and Antigonish Counties, provided they would agree to save a certain amount of both first and second growth clover for threshing. The offer was accepted and the huller, the first one operated in the Province, was delivered at River John last fall. The results realized point to the possibility of farmers growing considerable clover seed at least for their own use in the Province.

The following report from A. C. Tattrie, a graduate of the College at Truro, now farming in River John, who had charge of the machine, while it was in his part of the Province, is sure to prove of value and interest to those farmers whose operations may be hampered by the high prices now prevailing for clover seed. He writes:

"While here it threshed about thirty five hundred weight of seed, consisting of Common Red, Large Late, Alsike, separate and mixed with Timothy in many cases."

"Towards the last, three hundred weight was threshed in six hours. The clover seed obtained seemed to be of good quality especially where it was allowed to become fully ripened. In many cases, however, the hay was cut too green, which greatly reduced the yield and quality of the seed obtained. The yield from first growth clover would run from two to three hundred pounds of seed to the acre. The second growth clover was in every case cut too green, yielding only about forty pounds to the acre; heads would go through the mill without being threshed, but when they were examined they contained only immature, shrunken seed. This accounts for a considerable part of the difference in yield between first and second growth. However, the seed obtained from the second crop was practically free from weed seeds. The most prevalent weed in the first growth was sheep sorrel.

"To any farmer who saves clover next year for the first time, I would say, select a piece that stand up good, and then let it ripen until the heads and the stalks are mostly black. Of course, in a damp season this is very difficult, but cut it when the most of the heads are black. Alsike clover shells easily and must be handled carefully and cut slightly greener.

"The self reaper is an excellent machine for cutting the clover wit', as it leaves the hay out of the path of the team and the sheaves are convenient to turn, and then get it well dried to insure good work at threshing time. Keep a piece of the first growth to be sure of a crop and then save any second growth you can."

Arrangements will be made on application to further extend the usefullness of this clover huller. It is not likely that Nova Scotia farmers will grow much clover seed to sell but the great advantage which they will derive from growing at least some of their own seed will be the more liberal use of clover seed of their farms, and the more liberal growth of clover will mean richer fodder for the cattle and enriched farms.

M. CUMMING,
Secretary for Agriculture

Should Nova Scotia Farmers grow More Wheat in 1916.

Th amount of land ploughed in Canada and especially in Western Canada last fall was considerably less than in the previous fall, as is evidenced by the following quotation from the November issue of The "Census and Statistics Monthly," published at Ottawa:

"For all Canada about 54 per cent of the area intended for next year's crop is reported as ploughed by Oct. 31, as compared with 61 per cent last year and 54 per cent in 1913. In the Northwest the percentages are as follows: Manitoba 36, against 92; Saskatchewan 27, against 77; Alberta 34, against 56."

In Ontario, 25 per cent less land is reported to have been seeded to fall wheat, the principal wheat crop of that Province, than in the previous year. Moreover, agriculturists fear that, owing to an unusually open winter, the crop will not do as well as usual.

So far as fall preparations are concerned, everything points to a reduced wheat crop from Ontario west. This shortage may or may not be made up in the spring. Everything will depend upon the character of the weather then and also upon the nature of the growing season. In general, Spring ploughed land cannot be depended upon for a crop in the West to the same extent as fall ploughed land. Should either Spring or Summer conditions fail, there is sure to be a shortage in the wheat crop from Ontario west.

On the other hand, it is estimated that the visible supply of wheat in United States and Canada is 41,000,000 bushels more than a year ago, and an English authority estimates the world's supply is large enough to last until February, 1917.

Aside from agricultural consideration, one must remember that prices for wheat will be largely affected by th status of the war next fall, a matter in regard to which no one can at the present time make any certain prediction.

Summing up the whole situation, it seems wise to counsel farmers in Nova Scotia to prepare for the worst that can happen by growing just a little more wheat than formerly. Should next season be a favorable one or should the war be successfully terminated, it is altogether likely that prices for wheat and flour will not go up. But things may turn out otherwise, and as no serious loss can be sustained by those who do grow a little more wheat, it would seem to be a wise provision to prepare for the worst that may happen.

It seems needless to advise farmers that wheat requires better soil conditions than oats, or in fact any other cereal crop, and that accordingly it would be the height of folly to grow wheat on all kinds of land. An acre or two of wheat grown on well prepared lands may, however, be highly valued next fall. The methods of cultivation and varieties are discussed in the Annual Report of the Secretary for Agriculture, which will be available for free distribution shortly.

M. CUMMING.

HINMAN CO. WINS IN BIG PATENT SUIT

GIVEN JUDGMENT WITH COSTS.

Hinman Milking Machine Company of Oneida Awarded Damages in U. S. District Court Against the Visible Milker Company for Infringement —Watertown Concern Restrained —Judge Ray's Decision.

The following is from the Oneida, N.Y., Despatch

Judge George W. Ray of the United States District Court just handed down a decision in the action brought by the Hinman Milking Machine company of Oneida against the Visible Milker company of Watertown for infringement of patent, in which the court directs an injunction and judgment against the Watertown concern with full costs and an accounting to fix damages.

The decision is a notable victory for the Hinman Milking Machine company, whose machines, which have gained a world-wide reputation, have been imitated and infringed in various yparts of the country because of their sound basic principles and wonderful success.

The action was brought by the Hinman Milking Machine company to restrain the Watertown company from committing further infringement on the complainant's (Hinman's) patent and for damages for the infringements already committed. This case was tried in Uited States District Court at Syracuse, Aug. 31st and Sept. 1st and 2nd, 1915. Attorney Ralph H. Woolver of this city appeared for the Hinman Milking Machine company with Attorneys H. P. Dennison and E. A. Thompson as counsel. The Visible Milker company was represented by Attorneys John Conboy of Watertown and Fred Gerlach of Chicago.

What the Decision Means.

This decision gives the Hinman Milking Machine company a practical monopoly on the manufacture and sale of the valve-type milking machine industry, and it was in anticipation of a favorable decision that the company recently enlarged its plant on Elizabeth street to about double its former capacity. Their product is sold in every state in the Union, in Canada, Mexico, South America and a number of European countries, and orders from new territory are received almost every day.

Management of Calving Cow and Calf.

Where the herd has increased to the extent that it contains females of the various ages, they should be divided into lots of the same size and age. They will then make a better appearance before the visitor or intending purchaser. By taking him to a pasture where there are only the matrons of the herd he is impressed more than if there were a lot of yearling and two-year-old heifers mixed in among them. A pasture in which there are a lot of well-grown, thick two-year-olds looks better without the thinner cows being with them. And the yearling heifers may need a little extra feed which can only be given them when in a pasture with no others. In many ways we find it advantageous to have each kind separate.

When the cows are near to calving

Winnipeg

they should be turned into a small pasture located near the barns, so that they can be carefully watched. If everything is all right they may not need any assistance. But if a cow is too long in labor she should be taken into the stable and an examination made, because an undue length of time in labor hah a tendency to weaken both the mother and the calf. After the delivery is made see that the cow dries the calf. This is most cases she will be impelled by maternal instinct to do, but some cows, especially heifers with their first calves, sometimes need a little help. If she will not lick the calf her attention should be called to the calf by turning it over. Sometimes a little bran or meal or salt sprinkled on the calf will cause her to do her duty, but in some cases she will do nothing except butt the calf over whenever it attempts to get up. In this case the cow must be tied up in the stable, the calf dried by vigorous rubbing with coarse cloths, and then suckled.

Once it is filled with milk the cow will have learned her maternal duties. It will usually be in condition to take care of itself. For two weeks it should not be away from its dam more than a couple of hours at a time, as it needs a little milk at a time and needs it often. If allowed to get too hungry the calf will take an overdose when the opportunity offers, and indigestion will result from it. But after six weeks it will probably begin to eat a little mixed meal and bran, then the calf may be kept away from its dam. A little of this mixture should be kept in a box which is conveniently located for the calf to find, allowing it to suck twice a day. Given mother's milk twice a day and what grain it will eat, the calf will make a good growth and do it without being very much bother to anyone. To be sure if its early life comes in the winter it will need a good warm place to stay at night, but be sure to give enough exercise to keep the calf good on its legs. If it is summer time when the calf is born keep it away from the flies during the day, always remembering the food. Plenty of food and plenty of exercise always prove the making of the calf. The calf makes your profit if you get any. Keep up this feeding until the calf is six or eight months old. It will be a good eater by this time, and may be put on feed alone. The change will come so gradually that it will not be noticed.—"Breeders' Gazette.

No. 2 is 18 mos old. Prize Winner at Exhibition. His Dam now in R. O P. Test has produced in first two months of Test 2802 lbs milk and 121.4 lbs butter fat. His Sire is from Dam of above Bull.

No. 3 is 3 mos. old. His Dam is same as No. 2.

No. 4 is 7 mos. old. His Dam qualified in R. O. P. Test with High Records. These Bulls are all in Excellent Condition.

ARTHUR S. DENNIS,
"Willow Farm,"
Stewiacke, Col. Co., N.S.

Feeding Draft Colts for Size.

I have a colt that was foaled on April 23. On July 6 he weighed 506 pounds. He is a registered Shire. His dam weighs 1,900 pounds and his sire 2,000 pounds. On November 1 he weighed 840 pounds. Is that a good weight?—A Subscriber.

This colt is of good size and is backed by ancestry of the same sort. Continued liberal feeding of bone and muscle-making foods, with plenty of exercise, will enable him to grow into a real drafter. The feeding that wins out is the steady persistent kind; neither over-feeding and over-fatness nor under-feeding and lack of size are best for all-around results. Reports by our readers of methods used in sucecssfully growing out young drafters make useful and interesting reading.—J. L. Edmonds, Illinois Experiment Station.

Cull Weak Chicks Early.

From the time chicks are hatched until maturity the flock should be watched to remove any birds which show signs of weakness or lack of inherited vitality. It has been proved by experiments that chicks naturally weak at birth never make profitable birds to raise to maturity either for egg production or for meat.

It is good practice when the chicks are about a week old to separate those which show lack of vigor. Keep them by themselves, feed for rapid growth and dispose of them at the squab-broiler age.

Make another sorting out of the flock as soon as sex can be accurately determined, or about the 10th week. Take out all males and those which ar enot to be kept for breeders and feed especially for meat growth. If Leghorns are kept, they should be sold as soon as the market will take them for light broilers, for after a short time, even if they are strong and full of vitality every pound of meat they take on will cost more than may be realized for it in the fall.

WHICH WILL YOU BUY

A "Cream Thief" or a "Savings Bank" Cream Separator?

WITH a great many machines or implements used on the farm it doesn't make much difference which of several makes you buy. One may give you a little better or longer service than another, but it's mostly a matter of individual preference and often it makes little difference which one you choose.

Not so with buying a cream separator, however.

There is a big difference in cream separators.

The most wasteful machine on the farm is a cheap, inferior or half worn-out cream separator.

The most profitable machine on the farm is a

DE LAVAL

Cream Separator

A cream separator is used twice a day, 730 times a year, and if it wastes a little cream every time you use it, it's a cream thief," and an expensive machine even if you got it as a gift.

But if it skims clean to the one or two hundredth of one per cent, as thousands and thousands of tests with a Babcock Tester show the De Laval does, then it's a cream saver, and the most profitable machine or implement on the farm—a real "savings bank" for its fortunate owner.

But cleaner skimming isn't the only advantage the De Laval user enjoys.

There are many others, such as longer life, easier turning, easier washing, less cost for repairs, and the better quality of De Laval cream, which, together with its cleaner skimming, make the De Laval the best as well as the most economical cream separator.

If you need a De Laval right now there is no reason why you should let its first cost stand in the way, because it may be purchased on such liberal terms that it will actually pay for itself out of its own savings.

A De Laval catalog to be had for the asking tells more fully why the De Laval is a "savings bank" cream separator, or the local De Laval agent will be glad to explain the many points of De Laval superiority. If you don't know the nearest local agent, simply write the nearest De Laval main office as below.

The LAWRENCE-WILLIAMS COMPANY, Toronto, Can.

THE HORSE

Shoeing Malpractices.

Paring Down the Foot.—The unnecessary paring down and rasping of the foot is a reprehensible practice, much too common. The hoof should be interfered with as little as possible in fitting the shoe. It is without a doubt the principal cause of the various evils which result from improper shoeing. In cutting away and rasping the horn the object is to impart a symmetrical and attractive appearance to the foot, but a neat, elegant, and well-rounded look of the feet is no proof that the shoeing has been efficiently performed. In order to judge whether the work of shoeing has been properly done or not one should not if the wall of the hoof has been rasped, and pick up the foot and look at the sole to see whether this has been pared out or whether the frog is cut down at all.

Rasping the Wall

Rasping of the wall and paring of the sole are bad enough faults; slicing away any horn from the frog is a worse one. The rasping of the wall is objectionable because it robs the latter of much of its strength, weakens the horn, and tends to render it brittle. The strongest horn is found on the top, and if the surface is rasped away, weaker and softer horn is exposed, which is neither intended nor fitted for such exposure. None of the outermost portion can really be spared nor can it be removed with impunity. The surface of the crust or wall is covered by a kind of gelaninous film or layer (much the same as is the case with our finger-nails), which protects the horn from adverse external influences, such as the action of moisture and evaporation, and to preserve its toughness and resiliency. Rasping of course, entirely destroys this protective layer, to the great detriment of the crust. It is bad enough if the rasping is done lightly, with a view to suposed neatness, but it is much worse if, owing to the shoe being made unduly small, a really apreciable thickness of the wall has to be rasped in order to bring it to the level of the shoe. Often the shoes are made smaller and narrower than they ought to be with the object of making the hoofs look nice and small and adding to their neatness. Shoes made too small in a short time become more or less embedded in the crust at the qaurters and heels, the horn growing over their outside edge; when this is observed it is time to have the horse reshod, no matter how much wear is still left in the soes; and the farrier should be told this time to make them wider at the quarters and heels. The rasp may legitimately be used to aid in laying the clinches of the nails, and if slightly touched the crust when so used can scarcely be objected to. There is no need to pare the sole out, because the horn here flakes off of its own acocrd in proper time. Some little paring or rasping may have to be done to it just where it is contiguous to the wall in fitting the shoe, but it is quite a different thing from paring the sole all over. To remove a few loosened flakes with the drawing knife can, of course, do no harm.

Mutilating the Frog.

The soft horn of the frog seems to offer a rare attraction for the farrier's drawing knife. It slices away so nicely and easily, and can be cut down into such a symmetrical and pretty shape that the temptation to try to improve upon nature seems quite irresistible. But the frog is really intended for a more useful purpose than to serve as an object upon which to practice artistic skill. This pad of resilient horn is by nature intended to fulfil a highly important function, viz., that of breaking the force of concussion when the foot is placed on the ground, and of generally supporting and protecting the delicate internal structure in the rear portion of the foot. Hence it must be left intact, and on no account must it be pared down. The larger and more prominent it is the better, and it is eminently desirable that it should take a good bearing on the ground.—Fox.

False Quarter.

A false quarter may be defined as a fissure or depression in the wall of the hoof situated at the quarters, and caused by such destruction of the secreting structure that it is impossible to obtain a growth of healthy horn to fill up the interval.

It differs from sandcrack very materially in being much wider at its base, in generally containing a modified condition of horn, and in the coronary band showing a loss of substance corresponding to that in the crust. It is usually the result of tread or quittor, but any external injury sufficient to produce severe inflammation in the secreting substance, with consequent arrest of secretion, may cause it. As the secreting substance, once destroyed, cannot be restored, there is properly speaking, no "cure" for false quarter, and in old standing cases palliation by careful shoeing is all that can be hoped for. In early cases treatment, if there be a wound, takes the form of restricting the disease within the narrowest possible limits, by removing all ragged edges, making the wound as level as possible by bringing the edges together and inducing healing by secondary adhesion. The horse should be rested, because movement interferes with repair, and during work there is a greater liability for dirt and grit to get into the wound, which produces irritation and delays the healing process. If the case be an old one and the gap in the coronet is healed up and filled in with fibrous tissue,

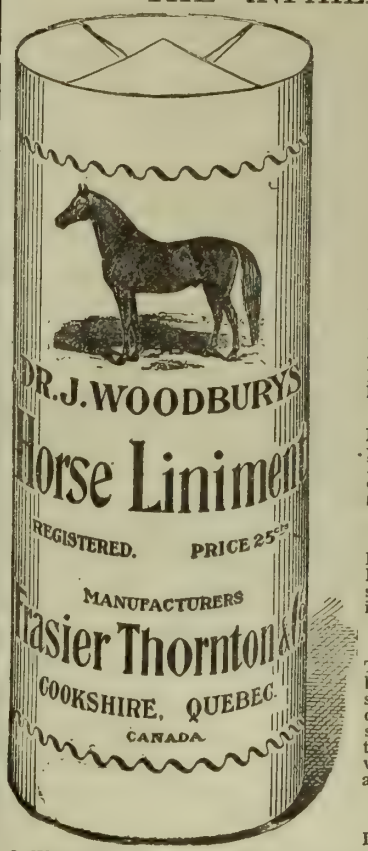
Dr. J. Woodbury's Horse Liniment

THE INFAILLIBLE REMEDY



For the removal of Splints, Bog Spavins, enlargements of any and every description it has no equal. Given internally, it will promptly relieve and remove any and every character of Cough Enlargements of the Glands, Affections of the Kidneys. For distemper, strangles, and colic it is infallibly the remedy All horses that are stabled should have an application of Dr. J. Woodbury's Horse Liniment to the hoofs of the forefeet to prevent their becoming feverish, dry, brittle, hard, contracted or otherwise injured Insist on having Dr. J. Woodbury's Horse Liniment. We warrant it to effect that for which it is recommended when used according to directions. Its beneficial effects are so prompt and decided that it has excited the admiration of the leading horsemen of the Dominion and secured their highest confidence.

Bear River, N. S.

Dear Sirs:—We do not hesitate in recommending your Dr. Woodbury's Horse Liniment. We have used it in the woods for coughs, colds, distemper and cuts and would say that no lumberman should be without it.

Yours truly, Clarke Bros.

Hubbard's Cove, N. S.

Dear Sirs:—I have used Dr J. Woodbury's Horse Liniment in my stable for years and consider it the best liniment on the market for both internal and external use.

Yours truly, C. C. McLean.

Truro, N, S.

This is to certify that I have used Dr. J. Woodbury's Horse Liniment with the very best results for colds, coughs, distemper and all lung deseases. It is the best to give horses in the spring to keep them in condition. It purifies the blood, cleanses the lungs from impurities which may exist and gives the system healthy action.

Newton Lee, Owner "All Right" 5817.

Elmsdale, N. S.

Dear Sirs:—Kindly send me 6 dozen bottles Dr. J. Woodbury s Horse Liniment. I have not a bottle in the store and it is the only kind my customers will take. Yours truly, Elmsdale Mercantile Co.

Elmsdale, N. S. Dear Sirs:—I cured my horse with Dr. J. Woodbury's Horse Liniment. It was a bad case of distemper. I always recommend this liniment to my friends as the best for all diseases of the horse. Yours truly, H. R. Whitehead.

Dear Sirs:—One of my horses had a bad cough and I made a complete cure with three bottles of Dr. J. Woodbury's Horse Liniment. The cough was of twelve months standing. In my large experience with horses I consider this liniment to be the best made for all diseases in the horse, I recommend it to my friends. E. J. Anderson, Truro, N. S.

Blood Thin and Weak Too Nervous to Sleep

Here is Another Case in Which Dr. Chase's Nerve Food Proved Its Great Reconstructive Influence.

Thin blood and exhausted nerves usually go together. A considerable portion of the blood is constantly consumed in keeping up the vitality of the nervous system. Once the blood is deficient, either in quantity or quality, the nerves suffer and bodily pains result. Headaches, neuralgic or sciatic pains are the indications in some cases, while in others weakness, nervousness, irritability and sleeplessness are the most marked symptoms.

Mrs. R. F. Catlin, Elm Springs, Sask., writes: "For years I was troubled with nervousness, and could not sleep nights. Also had lack of color as a result of the blood being thin and weak. My husband saw Dr. Chase's Nerve Food advertised, and got some for me, and wanted me to try it. I did so, and it has proven a wonderful help to me. By enriching the blood, it has restored color to my face and has built up the nervous system so that I rest and sleep well. It is a pleasure to recommend so excellent a medicine."

Dr. Chase's Nerve Food goes direct to the formation of pure, rich blood, and for this reason is the most certain means of increasing the quality as well as the quantity of blood in the human system. The feeble, wasted nerves are restored, and through the nervous system new vigor and energy is imparted to every organ and member of the body.

You will be surprised at the way this food cure puts new strength and vitality into the weakened body. And the best of it is that the benefits are both thorough and lasting. In this the Nerve Food differs from mere stimulating medicines which give rise to false hopes and when discontinued leave you as weak as before. Put this great restorative treatment to the test and prove its merits in your own cases. 50 cents a box, 6 for $2.50. All dealers or Edmanson, Bates & Co., Limited, Toronto.

What Standardization Means to Motor Car Buyers

IT means VALUE. Just to the extent that a car is standardized does the buyer's dollar approach the maximum of purchasing power.

Standardization means definite, proved quality, known manufacturing costs and reduced selling costs.

Of the million autos that will be sold in 1916, 75% will be standardized cars selling for less than $1000.00 each. This remarkable American achievement is the direct result of standardization.

Finally the upholstery has been standardized by the almost universal adoption of

DU PONT FABRIKOID
REG U S PAT OFF

MOTOR QUALITY

40% of all 1915 cars sold were upholstered in this proved, guaranteed material and in 1916 the total will be at least 60%.

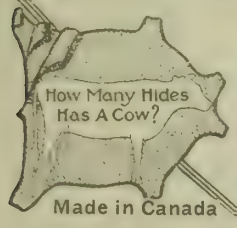
Fabrikoid is the only standardized automobile upholstery. It wears better than coated splits (commonly sold as "genuine leather") and has the artistic appearance and luxurious comfort of the best leather.

Rayntite Fabrikoid for tops, single or double texture, is guaranteed one year against leaking, but made to last the life of the car.

To get the most for your money, buy a standardized car

Du Pont Fabrikoid Co.

Toronto, Ont. Wilmington, Del.



Craftsman Fabrikoid, the artistic upholstery material for furniture and home decoration is sold by leading department stores.

Made in Canada

ADVERTISE IN THE MARITIME FARMER TO GET RESULTS.

little can be done except to prevent the insinuation of dirt or grit into the fissure, to relieve the part of weight bearing, and employ the animal at slow work. Over-exertion or violence may cause the fissure to open and occasion painful lameness. It is a good plan to fill the fissure with guttapercha to prevent dirt getting in, and, if suitable in other respects, to apply a bar shoe, so as to take the bearings off the weak part. In well-managed cases the spurious horn thrown out from the secreting laminae forms a sufficient protection for the sensitive parts immediately beneath, and the horse becomes workably sound. Great care must be taken not to injure or weaken the horn in the neighborhood of a falsequarter by rapsing when shoeing. When the crust is thick and qaurters are strong the perssure may be removed off the wall at the injured part by paring a little off the bottom of the crust at the part, so that it shall not touch the shoe, but if the foot is weak an indentation or hollow should be hammered out in the shoe.—Veteran.

Seedy Toe.

This powdery degeneration of the horn is apparently produced by anything interfering with healthy growth, and it is frequently a concomitant of bad or defective shoeing.

The first appearance is not that of of a cavity, such as we find in advanced cases, but a changed and softened horn, which may be dry and crumbly, or moist and cheesy; in both cases, however, lacking the toughness and cohesion of healthy horn. Seedy-toe is generally painless; it may exist for a considerable time without causing lameness, which, when it does occur, is caused by weight being thrown on the diseased portion of the wall. This lameness can usually be temporarily relieved by providing a shoe that does not press upon the diseased part. The presence of seedy-toe may, in advanced cases, be suspected when a portion of the wall appears either bulged or depressed, and gives out a hollow sound when tapped with a hammer, but to confirm the diagnosis the shoe must be removed. The "white line," the connecting link between the wall and the sole, is then seen to be replaced by a narrow slit, which, however, does not by any means indicate the extent of the disease, for the degeneration of horn may extend upward for several inches, and even reach to the coronet. The width of the diseased part may vary between a quarter inch and three inches.

As a rule, the space is a narrow one, but when all the diseased horn is cleared out the cavity is of considerable size. The usual thing after clearing out the diseased horn is to fill the civity with tar and tow, replace the shoe, and in doing so make provision that the wall bounding the cavity should be relived of all pressure. In view of the possibility of the disease being caused by an organism, it is recommended that after cleaning out the cavity it be dressed with pure carbolic acid before filling it with tar and tow. In advanced cases a bar shoe could be applied, and the nails omitted at the diseased parts. If the horse is to continue working it is of great importance that the diseased portion of the wall should be relieved of weight. It is necessary also to avoid raising the heels whereby throwing the weight forward may cause lameness; calkins and wedge heels should, therefore, be avoided. Considerable time is required for the cure of seedy-toe. In bad, neglected cases, where lameness persists and careful shoeing does not relieve it, there is nothing for it but to cut away all the detached wall and remove disintegrated horn, thoroughly disinfect the parts with carbolic acid, apply a bar shoe, smartly blister the coronet, and give a long rest until the foot has grownagain and is strong enough to bear the attachment of a shoe.

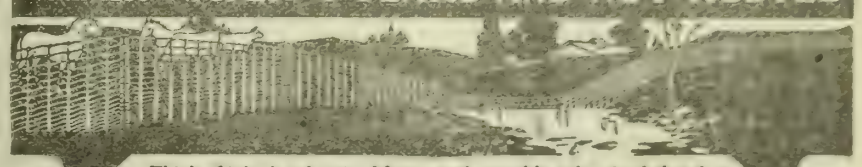
Handling the Colt.

Did you ever try to break a six-month-old colt to the halter? What hapened when you did it? Very probably there was a pulling match and if you were not careful, you were dragging around the box stall at the end of a rope. Then, if that colt did manage to get the best of you, there was more trouble ahead when breaking time arrived. The youngster had learned his strength, and was ready to try it again. Why not avoid this? Begin to break the colt when it is five or six days old if you want to save time and trouble. By the time a colt is a week old you can begin the first lesson in leading. Put on a halter of soft rope or webbing and you can soon teach the little fellow to lead beside his dam. Every time you take them to and from the pasture, use the halter on the colt and it will soon come to expect it. If you begin early, your colt is half broken before it ever sees a harness. Nor should the halter be the only thing the young colt should become acquainted with. Handle him frequently especially round the legs and feet; teach him that you intend no harm when you pick up one of his feet, or use a brush on his hind legs. One lesson with the colt is worth three with the grown horse. Treat him kindly, but never let him get the best of you. Here is a chance for you, boys. See how well you can train one of the colts your father is raising. Don't make it a spoiled pet, but a well trained colt.—"Hoard's Dairyman."

UNDER WATER 4 YEARS AND NOT RUSTED



Think of it! A galvanized fence so thoroughly galvanized that four years of submersion—summer and winter—could not faze it. That's Mr. Cummings' experience with Peerless Fence. Read what he says. Here's his letter.

Gentlemen—I have handled your fence for four years and find it a good, strong and durable fence, and find that the galvanizing is first-class. In referring to this I have a fence that I put on four years ago across a gully, and the water is as high as the second wire and it is not rusted nor broken yet. I have a team of heavy horses that ran into the fence last summer and did not break or damage it in the least, and I am glad to say that in the four years I have handled your wire I have had no complaints about it.
Yours truly, DAVID CUMMINGS, Bowesville, Ont.

Incredible—unbelievable—you say? Not when you remember that

Peerless Perfection Farm Fencing

is different—that it is made of Open Hearth Steel Wire. The Open Hearth process burns all the impurities out of the metal, thus removing one of the greatest causes of rust. The wire is then galvanized so thoroughly that it will not flake, chip or peel off. Every intersection of the wires in our farm and poultry fences is securely locked with our Peerless Lock. While the locks hold the wires securely together, these fences can be readily adjusted and perfectly stretched over uneven ground. It is easily erected and requires fewer posts than when used, fewer posts are required. Get the details. Send for free literature. It also describes our farm gates, poultry fencing and ornamental fence.

Agencies nearly everywhere. Agents wanted in unassigned territory.

POULTRY

Improvement of Stock.

During the last few years great strides have been made so far as the quality of fowls is concerned, but a great deal more is required before the ideal is attained. To obtain an increased egg yield is the aim and object of every utility poultry keeper. To this end the first and foremost consideration is to improve existing stock. There are several ways of bringing about improvement in the quality of the ordinary farmyard stock, but it must be remembered that whatever system of improvement is to be carried out must be done in a considered manner, and be extended over sufficient time for results to justify its continuance. It frequently happens that if improvement be not immediately apparent some other method is started, which probablyl is entirely different with the result that the stock, instead of assuming a higher standard is in worse condition than would have been the case had no improvement been attempted.

The Favorite Method.

The favorite method of improvement is that of securing a male bird of the breed that it is eventually intended to keep, mating him with a number of selected hens or pullets. This plan appeals to most farmers, since it does not mean a general upheaval of the entire arrangements or cause much of a change in the method of management. It is usually found that the farmer is much more likely to improve his stock if some simple plan is laid before him, whereas when a drastic measure is recommended he thinks twice before he acts upon it, and generally he ends by continuing on the old lines.

System Required.

In the present time of strife and trouble, when an increased yield in eggs is so important, it behoves everyone interested in the poultry industry and the farmer especially, to improve his stock with this end in view. We find that the majority of farmers, even those who pay but small attention to poultry, secure new male birds each year, but they invariably choose a different breed, with the only possible result that the fowls retain their mongrel appearance. When new males of the same variety are introduced every year the members of the poultry yard rapidly assume the distinct characteristics, both in outward type and in economic qualities. Excellent as this method is it may be very considerably enhanced and the improvement more pronounced in a much shorter time, if greater care is exercised at the commeucement in selecting the hens or pullets that are to be mated with the first newly imported male bird. The hens are frequently chosen irrespective of breed, and they are different in every characteristic from the cock The result is that a much longer period is needed before improvement can be brought about. Especially does this apply to the newer varieties of poultry since in many of the later established varieties the type is not sufficiently fixed to have much influence over the progeny.

The Choice of the Hens.

This trouble may easily be obviated however, by selecting hens as nearly alike in build and character to the male as possible, and if this is done, even in the first year distinct improvement is noticed. The foregoing plan is very simple carried out, the only extra labor entailed being the erection of a small pen in some convenient place where the breeding stock can be kept. When all the eggs that are intended for sitting have been obtained, the occupants of the pen can be restored to freedom and allowed to return to their usual quarters. It will thus be seen that improvement in the existing stock may easily be secured and maintained at a very small outlay. Reliable birds can be readily obtained at a moderate cost from breeders who are conducting their operations on purely utility lines. Careful attention to the selection of the best individual layers from the flock year by year undoubtedly helps to establish a good laying strain, but all the advantage that accrues from breeding from hens known to possess remarkable laying powers is neutralised if the male is not also from a good laying source. The male possesses a much greater influence than is usually supposed over the egg producing powers of his progeny. It will thus be seen how important it is to secure a male bird from a good laying strain.

The Male Bird.

There are many poultry-keepers who delay the introduction of the male bird into the breeding pen too long to ensure early fertility in the eggs. It is well known that not for ten days or a fortnight afer mating, provided that teh hens are laying well and regularly can the eggs produced be relied upon to be fertile. When I say that the introduction is delayed too long, it is not meant to convey the idea that a longer period is required to ensure fertility but rather to indicate that the matings should take place much earlier in the season.

Signs of Ill-Health.

It is not at all uncommon that within a week or ten days after the male bird has been with his mates he goes completely off color. As a matter of fact he becomes so bad that the only course to adopt is his immediate removal from the hens. This leads to great delay and much inconvenience at the most important time in the poultry-keeper's year, because before a fresh cock can be secured, or the old one cured of his malady sufficiently to resume occupancy of the breeding pen, valuable time is wasted, time it is impossible to recover. The reason why a male bird should go so completely wrong after so short a time with the hens is difficult to account for. I have frequently seen a number of young cockerels looking in the very pink of condition, showing every indication of vigor and vitality, which when they have been sold and removed to another place, in a very short space of time have become ill and quite unfit for breeding purposes. It is more than possible that the set of changed conditions is responsible for this failure in a seemingly fit and strong cockerel such conditions as soil, feeding, water supply and management These may all have been entirely different from what the bird was accustomed to and hence the react on the system and this combined with the first strain of the breeding season, has the effect already mentioned.

The Value of Isolation.

This difficulty may very largely be combated by the simple device of isolation. That is to say, when the male has been purchased, keep him apart from his prospective mates until he has grown quite accustomed to his changed circumstances. A further advantage of isolation is that, should the bird have got cold on his journey or should he have any latent disease, the hens will be free from infection, since if there is no sign of disease after a fortnight, it may be fairly supposed that the bird is all right and in condition for his duties. It will thus be seen how necessary it is, first to purchase the male bird sufficiently early to allow of his isolation in order that he may become acclimatized and accustomed to his new quarters, and then thoroughly to test his quality and constitution before the time actually arrives for his services. In this case should anything go wrong with him, further arrangements may be made before the season is too far advanced unduly to delay the hatching operations.

The Kind to Choose.

The sort of bird to be used is also very important and yet, it is frequently neglected. I lately visited a farmer whose pens were completed at the time of my visit. I thought that the male in one of the breding pens looked some what strange, and upon drawing attention to it, was informed that it had been used for three years and he was considered quite good enough to be given another season's trial. Operations conducted on these lines must sooner or later end in disaster. There are such excellent facilities offered at the present time for gaining information on this and kindred matters that it is entirely the poultry-keeper's own fault if he fails to take full toll of the assistance offered.

Why Chicks Die in the Shell

There seems to be a wide and varied opinions as to why chicks die in the shell. Among the common causes are weak germs caused by close in-breeding, too close confinement and improper feeding. The writer is fully convinced after many careful demonstrations that while the above causes are partially true, the principle cause is improper ventilation. The chicks suffocate from insufficient air.

The ventilation of most incubators

John A. Bruce & Co., Ltd., Hamilton, Ontario
Established Sixty-six Years.

remains practically the same from the beginning to the end of the hatch and while it may be just right at some stages of the hatch it certainly is not right all the way through. If the proper amount of air passes through at the beginning of the hatch, then as the chick grows it must have a greater amount, and if it is not forthcoming, suffocation follows.

The ventilation of many incubators is such as to cause a draft, drying the eggs too fast, causing the membrane to become tough, so much so that at hatching time the chick is unable to break through, and many die in the shell after piping. If this membrane is kept soft and brittle, as when fresh laid, the chick would easily pick its way out.—Archie E. Vandervort.

Correct Brooder Temperature.

The temperature of the brooder or the brooder house when the chicks are first transferred from the incubator should be practically as high as the temperature of the incubator from which the chicks have just been removed, or 95 to 100 degrees. This temperature should be maintained for the first week and never allowed to fall below 95 degrees.

The second week it should not be allowed to drop lower than 90 degrees. These temperatures refer to the air temperature taken on a level with the chicks. After the second week the temperature should be reduced gradually until the chicks are old enough and hardy enough to do without artificial heat. At no time should the chicks be uncomfortabe, either on account of too much cold or too much heat.

If they are too cold they will huddle together, those on the inside of the bunch will become too warm and will pass to the outside, where they become too cold again. Under these con ditions the chicks rapidly catch cold and die. On the other hand, it is almost as bad to have the temperature too high for in this case the vigor of the chicks will be educed and they will be unprofitable. The heat should radiate from above down on the chicken's backs.

Housing Geese.

Because geese are very hardy birds that is not sufficient excuse to neglect them so far as their housing arrangements are concerned. To achieve good results a comfortable shed should be provided for their accommodation. The house should be about 4 ft. high, and made of fairly thick boarding. If the timber is very thin the interior becomes too cold during the winter and and too hot druing the summer. The earth makes the best floor, as wood, cement, and bricks are all unsuitable and liable to lead to leg weakness. I have always found it a good plan to use a shed entirely, or almost, open in the front. If the house can be placed in a sheltered position no shutter is necassary, but if out in the open, exposed to the wind and rain, it is advisable to have one which can be opened or closed at the top so that during a driving rain it can remain partly open, yet at the same time afford protection. An abundant supply of fresh air is necessary, without which ill-health will make itself apparent among the birds. No overcrowding should be allowed, and as far as possible about 6 square feet of floor space should be given to each bird; that is, a house 6 ft. by 8 ft. accommodates eight adults.—Expert.

Cooling Eggs While Hatching.

A very common mistake in artificial incubation is made with regard to the daily cooling of the eggs. It is seldom that operators allow sufficient time for this, which can only be accounted for by the fact that it is usually believed to be harmful. It must be remembered that an egg takes a long time to lose its heat, and therefore if only time to cool for a few minutes it has very little effect. Again, the length of time given must depend on the temperature of the room, for the eggs lose their heat more rapidly in a cold room than in a warm one. Taking the average temperature of 60 degs., the eggs should be cooled for twenty minutes in the morning and fifteen in the evening. The difference in length is suggested, for usually a longer time elapses between the night and moning cooling than between the morning and evening. If the temperature in th eroom is only 50 degs., then fifteen minutes in the morning and twelve minutes in the evening is suffieient; if the room is only 40 degs., then twelve minutes and ten minutes is ample. If, on the contrary, the room is 70 degs., twenty-five minutes should be allowed in the morning and twenty minutes at night, while if it be 80 degs., then thirty-five minutes and thirty minutes respectively should be allowed.—Expert.

Shipping Eggs for Hatching.

I pack in baskets, first putting excelsior in the bottom and all around the sides. Wrap each egg in paper, packed tight so they can't shake. Be sure to but plenty of excelsior on top, stand it on end and then put the excelsior around the eggs so they will not strike each other. They must be then sew a cloth over them and they are ready to ship.—(Mrs. J. E. Bundy.)

Two on a Rancho.

(Continued from Last Issue).

IV.

It was a very quiet ceremony the next morning, with only a doctor and one of the nurses as witnesses. Immediately afterward they crossed to Jaurez and boarded the train. Miguel, whose sly smile at sight of the senor's companion had frozen on his lips at the words "My wife," was in charge of a much excited and very clean canine, which had been but a street pariah the day before.

Several times armed parties halted them, but Miguel's voluble explanations, and a look of comprehension into the pale faces of the two, was always satisfactory, though Barlow fumed fiercely at every softened glance flung his way. Miguel proved a capital dragoman, pointing out what spots there were of interest in the flat, drab landscape, telling tales of the hill country, of jaguars, and of the droves of relentless javelin hogs, that never leave their prey until a kill is made.

He also told of the ceaseless warfare and brigandage that was laying waste his land—tales of violence and valor, with himself much to the forefront. At Jaurez, Miguel had been an ardent insurrecto; but as they dropped farther and farther south, over the hastily relaid rails and propped up bridges, he grew quite scornful of the ragged patriots and their war cry of 'Libertad!" By the time he reached the first outpost of the federal army he was leaning far out of the window, cheering for the government.

It was mid-afternoon when they reached Rio Vuelta, a metropolis of three thatch-roofed adobe houses set in a jungle of giant cactus and beargrass. From some invisible place Miguel procured a hack drawn by two little gray mules, and they set off to the west straight toward the descending sun.

Ahead loomed rolling hills, and beyond were the snowy peaks of the sierras, which soon blotted out the cruel, swordlike rays of the tropic sun. As it became rapidly cooler, their jaded eyes brightened, and they talked with animation of the things they saw and passed—the mourning doves in the manzanita bushes, the chaparral chickens that darted across the road, and the jack rabbits that danced ahead like fairy sprites. The dog became very much interested in these last, and it was all they could do to keep him in the hack.

The moon followed on the footsteps of the first stars, an orange ball that soon whitened to silver as it rose higher and higher through the clear seas of the night sky. With its coming, they became subdued, and soon fell into a silence that lasted the rest of the drive. Even Miguel seemed depressed; and when the low, white building loomed up ahead, his introduction was but a muttered—

"La hacienda!"

Then they rattled down the slope of a deep aroyo, and splashed into a shallow ford, where the mules halted and drank noisily. Here, in the deep blotch of shadow, and under the weight of the night's silence, it was uncanny. They leaned close together, as if from a simultaneous presentiment.

From the rocks above them rose a thin, eery wail, an almost childlike whimper. The dog growled, and the fur stood up on his neck. The little mules, after one moment of strained listening, dashed forward and swept them up the hill to the gate of the hacienda.

There blazed a welcome light, and the fat, genial face of Anna, Miguel's wife, smiled a welcome. The grip of terror that held them relaxed into sheepish laughs.

"What was it, Miguel?" asked Barlow.

The Mexican shrugged his shoulders.

"Dat jaguar. He beeg tief; steal pig, calf, horuse—sometimes, when he hongry, man. I am no scared."

In his room across the patio Barlow heard his bride and Anna talking together—low, inaudible, feminine murmurs. Somehow the sound was very soothing, and he was asleep before he had time to review the happenings of the momentuous day.

V

It was very late when they met under the bean-vines in the patio the next morning, and were joyously welcomed by a furry whirlwind of happiness.

"Oh, senor, senora!" cried Miguel, appearing with the fresh goats' milk and rolls, "Dat dog! He have chased de jack-rabbit until I t'ink he die. He much like de rancho, si?"

"I know he likes it," whispered Jane, with a dim glow in her eyes that made Barlow inwardly uneasy. "I wish he was a little dog—just a little puppy-dog. It would be sweet to see him grow!"

"Which reminds me that you want a garden," replied her husband. "I'll go and consult with Miguel"; and he fled ingloriously from the dim glow in the eyes of a mere woman.

His request humbled the omniscient, accommodating Mexican to despair.

"A garden, senor? There never have been a garden here. Eet is too hot, too much sun, and there is too small rain. Look, not even grass, senor."

Barlow's eyes followed the brown finger pointing to the bare, baked slope rolling higher and higher behind them, like the crest of a wave. Against the drab outline there was no green except the green of the cactus, which waters itself, so Mexicans say.

As Barlow looked, his face darkened. It was impossible that they should have to be disappointed in their wish for a garden. He had promised it her; and though he considered the request more or less silly, he believed in keeping his promises. For a long time he was silent, gazing at the steely frame of the morning heat about the distant shimmering peaks of snow.

"No water!" he pondered, and then turned and pointed down into the arroyo. "But there is running water there. Where did it come from?"

Miguel was hazy. He shrugged his shoulders; spread out his hands toward the whoel sierras, and rolled a cigarette complacently. It did not matter, yes? No one bothered to find out where water came from, so long as it was there. It was cold water; it came from the melting snows. That was as far as his knowledge went; but even that small bit gave his master an idea.

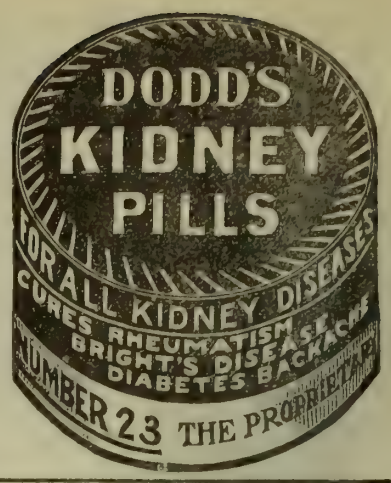
"Hitch up the hack," commanded Barlow.

All morning the horses toiled over the hills above the hacienda, while Barlow, squinting in the blazing glare, searched every slope, every ravine, oblivious to the passing them. In his heart was the joy of the worker.

Finally, when hope had begun to pale they drove up a rising trail to a flat plateau, a rampart of the high

A WOMAN'S MESSAGE TO WOMEN.

If you are troubled with weak, tired feelings, headache, backache, bearing down sensations bladder weakness, constipation, catarrhal conditions, pain in the sides regularly or irregularly, bloating or unnatural enlargements, sense of falling or misplacement of internal organs, nervousness, desire to cry, palpation, hot flashes, dark rings under the eyes, or a loss of interest in life, I invite you to write and ask for my simple method of home treatment, with ten days' trial entirely free and postpaid, also references to Canadian ladies who gladly tell how they have regained health, strength, and happiness by this method. Write today. Address: Mrs. M. Summers, Box 309, Windsor, Ont.



Women Once Invalids

Now in Good Health Through Use of Lydia E. Pinkham's Vegetable Compound. Say it is Household Necessity. Doctor Called it a Miracle.

All women ought to know the wonderful effects of taking Lydia E. Pinkham's Vegetable Compound even on those who seem hopelessly ill. Here are three actual cases:

Harrisburg, Penn.—"When I was single I suffered a great deal from female weakness because my work compelled me to stand all day. I took Lydia E. Pinkham's Vegetable Compound for that and was made stronger by its use. After I was married I took the Compound again for a female trouble and after three months I passed what the doctor called a growth. He said it was a miracle that it came away as one generally goes under the knife to have them removed. I never want to be without your Compound in the house."—Mrs. Frank Knobl, 1642 Fulton St., Harrisburg, Penn.

Hardly Able to Move.

Albert Lea, Minn.—"For about a year I had sharp pains across my back and hips and was hardly able to move around the house. My head would ache and I was dizzy and had no appetite. After taking Lydia E. Pinkham's Vegetable Compound and Liver Pills, I am feeling stronger than for years. I have a little boy eight months old and am doing my work all alone. I would not be without your remedies in the house as there are none like them."—Mrs. F. E. Yost, 611 Water St., Albert Lea, Minn.

Three Doctors Gave Her Up.

Pittsburg, Penn.—"Your medicine has helped me wonderfully. When I was a girl 18 years old I was always sickly and delicate and suffered from irregularities. Three doctors gave me up and said I would go into consumption. I took Lydia E. Pinkham's Vegetable Compound and with the third bottle began to feel better. I soon became regular and I got strong and shortly after I was married. Now I have two nice stout healthy children and am able to work hard every day."—Mrs. Clementina Duerring, 34 Gardner St., Troy Hill, Pittsburg, Penn.

All women are invited to write to the Lydia E. Pinkham Medicine Co., Lynn, Mass., for special advice,—it will be confidential.

HYSLOP BROTHERS, Limited
Dept. 30 Toronto, Ontario

sierra; and lo, there gamboled and sang a sturdy stream of limpid water, which ran along the centre of the plateau and then plunged off down a steep slope that fell away toward the south.

"Our garden, Miguel!" he cried.

Getting down, he paced here and there, like a hound on a scent, testing the stream's depth and strength of flow, and finally judging with an expert's eye, the levels to the hacienda shimmering in the heat below them. When he looked up, it was with a radiant face.

"In a month, Miguel, that water will flow into the back yard of the hcaienda!"

Miguel had shrugged his shoulders in pagan doubt, but Barlow's prediction came true. Aggrandized by his self-importance, the Mexican had scoured the country and gathered a small army of half-starved peons, whom he ruled with a sway imperial. There was really little to be done, for nature proved exceptionally kind, and it was only necessary to divert the stream for some hundred yards into a dry ravine that led almost directly to the hacienda.

It was a happy, busy, glorious month for Gordon and Jane, not to mention the dog. When they weren't out watching and directing the workers, Barlow was busy with his scale of levels, computing water-heads, and drawing intricate drainage maps, while his wife pored for hours over alluring seed catalogues.

Then came the wonderful day when the water was diverted into its new channel. As if trained, it swept down into the garden laterals and over the slope below, to join the other stream in the bottom of the arroyo. It splashed gaily into the bathtub that had been sent from El Paso, and gushed forth from a faucet in the kitchen, much to the amazement of Anna, who crossed herself devoutly at this evidence of the Lord's power and goodness.

Before the laborers left, they were invited to bring in their families, and a dance was held on the cleared floor of the barn. There were laungter and song and the syncopated melody of mandolins late itno the night.

Jane, her eyes shining and cheeks flushed, looked on from the patio in a very ecstacy.

"Isn't it beautiful!" she whispered half aloud. "All of it! This is heaven!"

He laughed shortly, his sick soul still unable to brook enthusiasm.

"If this isn't heaven, we'll know what is, soon enough."

Then they were silent, for a cloud had drifted across the face of the moon.

VI

If thre was a cloud over their hearts, it soon lifted before the enthralling task of laying out the garden and planting the seeds. Side by side they worked, refusing to let any hands but theirs do the planting. Jane murmurer over every little seed, a soft little croon in her voice, while Barlow's efforts were largely devoted to restraining the dog, who seemed to regard it all as a mammoth burying of bones, and was naturally inquisitive.

When Christmas came, the garden was in full bearing. It was a new Christmas to them—a bright, warm day, clear as a jewel, and alluring as a gipsy with a rose in her mouth. Miguel had climbed fifteen miles into the mountains for a ragged little pine, which they bedecked for the children nearest the hacienda; and there was a special limb for the dog.

When the happy children had gone, and the Maker's glowing pencil had dotted in the star-periods, they sang all the old carols they could think of; and when the last was finished they fell silent. It had been a pleasant day, but somehow memories are always the sweetest.

When she turned to him, her lashes were wet.

HONESTLY BELIEVED

HE WAS GOING INTO

CONSUMPTION.

DR. WOOD'S
Norway Pine Syrup
CURED HIM.

Mr. Frank E. Anthony, 69 Ellen Street, Winnipeg, Man., writes: "Having taken several bottles of Dr. Wood's Norway Pine Syrup, during the past few weeks, to relieve a chronic cough and general throat trouble, allow me to express my unbounded satisfaction and thanks as to its sterling qualities. A short time ago I became suddenly subject to violent coughing fits at night, and directly after rising in the morning, for about an hour, and found I was gradually losing weight. All my friends cheerfully informed me that I looked as though I were going in consumption, and I honestly believed such was the case. However, after having taken several bottles of 'Dr. Wood's' I am pleased to relate that the cough has entirely disappeared, along with all the nasty symptoms, and I have since regained the lost weight. I have no hesitation in recommending Dr. Wood's Norway Pine Syrup as a sure cure for all those troubled in a like manner."

When you ask for "Dr. Wood's" see that you get what you ask for. It is put up in a yellow wrapper; three pine trees the trade mark; the price, 25c and 50c.

Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

First Aid for Cuts.

In reply to a letter from Mrs. S. B., asking for some information on what to do first in the case of a member of a family cutting himself or herself badly before a doctor can be reached, I may say :

The first consideration, of course, is to prevent excessive bleeding. A moderate amount of bleeding is an excellent thing, and permits washing out of the wound. The second consideration is the condition of the instrument with which the wound was made, namely, whether it was clean or dirty and the condition of the skin or clothing through which the instrument may have passed in making the cut. The third consideration will be the nature of the cut itself, i. e., a free, open wound, or a narrow puncture. Provided a doctor is available within a reasonably short time, say a few hours my own advice would be to first have fairly free bleeding, then stop the bleeding (by pressure and raising the part above the rest of the body), and leave the wound until the doctor comes in most cases.

If the wound is made by a very dirty instrument, or has accidentally received a great dose of dirt of some kind, especially soil, manured soil in particular, or manure itself, then I would turn a tap on it or otherwise wash it under a flowing current of water very thoroughly indeed. If these two matters are attended to, I think that in the most cases it will be quite safe to wait until the doctor comes. If the wounds are punctured, promote free bleeding and hurry the doctor, since it may often be necessary to give tetanus antitoxin, to cauterize, or to lay the whole wound widely open, perhaps all three.

For minor wounds, when a physician is not ordinarily called in, the same principles apply. Permit free bleeding for a time, then stop the bleeding and close the wound by gently pressure until the edges stick. Then the ideal treatment after that is simply to keep the part from any injury which would break the seal and let the wound open.

I certainly would not use coal oil or any other substance for a wound which a doctor was going to see, nor would I use them on wounds that the doctor is not going to see. Any wound which requires disinfection should be disinfected by the physician and household measures of this kind are not advisable at all. In cases of doubt, watery solutions of bichloride of mercury,one in a 1,000, cannot be improved upon. Carbolic acid in many people produces blisters and burns. It must always be remembered that bichloride is a deadly poison in tablet form, and even in liquid solutions of one in a 1,000, so that every precaution must be taken to see that children do not eat the tablets or drink the solution.

When it is necessary to protect a sealed wound of a trivial nature, for which a physician has not been called, do not put a handkerchief or some other exceedingly dirty piece of cloth upon it, and whatever cloth is used, do not tie it tightly. The best covering for such a wound is no covering at all, but most people, especially children, require something to remind them not to knock the injured finger, and a loose, large bandage, which will cover the finger in a bunchy way and make them guard against knocking it, is good principally to call their attention to the fact that they are to watch the finger. Avoid rubber finger stalls, court-plaster and things of that kind absolutely. Even collodion is not a good dressing for a cut unless it has been thoroughly treated by a physician.—H. W. Hill, Director of Public Health, London, Ont., in Farmers' Advocate.

Are Worth Their Weight in Gold

WHAT MRS. BROWN SAYS OF DODD'S KIDNEY PILLS

New Brunswick Lady Feels It Her Duty to Tell Women That Dodd's Kidney Pills Are the Best Remedy She Ever Used.

Miscou Harbor, Gloucester Co., N. B., March 2.7—(Special.)—"I think Dodd's Kidney Pills are worth their weight in gold." This is the statement of Mrs. James Brown, well known and highly respected here.

"I think it would be ungrateful on my part if I did not tell what a blessing Dodd's Kidney Pills have been to me," Mrs. Brown continued. "I was in bed three weeks with headache and sore back. Then I began to use Dodd's Kidney Pills and I found them the best remedy I have ever used."

Mrs. Brown is just one of the many women in New Brunswick who are telling of pains relieved and health restored by the great Canadian kidney remedy. Dodd's Kidney Pills are suffering women's best friend, because they act directly on the kidneys. They tone up the kidneys and put them in condition to do their full work of straining all the impurities out of the blood. Nine-tenths of women's troubles come from diseases or disordered kidneys. There is abundant evidence on every hand that Dodd's Kidney Pills cure all Kidney troubles.

The Teeth.

Inasmuch as the importance of general hygiene is rapidly growing in public recognition, and as hygiene of the mouth in particular is developing into one of the most important branches, it has been deemed desirable to present the subject of dentistry in relation to its effect upon the employe.

There is no single factor that so impoverishes a community as disease, and there is no single portal that is so predisposed to disease as the mouth. The presence of decayed teeth means improper mastication of food—consequently indigestion with resultant malnutrition and anaemia. Unclean mouths and decayed teeth act as the breeding places for many forms of pathogenic bacteria and the liability to contract contagions diseases is thus greatly increased. Local pain and discomfort, with many other abnormal physical symptoms and conditions can often be traced directly to this source.

The practical result of this condition upon the efficiency of the employe is worth considering. There is a decided loss of time due to local pain and discomfort, and to disease which originates in neglect of the mouth and the teeth. The constant swallowing of pus from abscesses and old roots with fistulas is not only a most potent and prevalent cause of stomach trouble, but the catarrh set up is not only irritant and actually infective but may lead in time to other more permanent effects, namely, drying up of glands, chronic stomach diseases, and in some cases to ulceration.

The matter is important not only in relation to indigestion, but t othe whole

Give me a chance to PROVE my flour

I WANT folks to know what a splendid flour Cream of the West is. I want you to buy a bag at your grocery store. Use it for a couple of bakings and see the result.

Cream of the West Flour

the hard wheat flour guaranteed for bread

With Cream of the West you will have success or your money back. Your bread will do you credit or you don't pay one cent for the flour. Send back what you have left in the bag and your money will be refunded in full.

A strong, nutritious, light-rising, guaranteed flour, unbeatable for bread. That's Cream of the West. Try it.

Queen City Flour. This is a blend of Ontario and Western wheat. It is a splendid all-round flour for all bread and pastry purposes.

Monarch Pastry Flour is milled from Ontario soft wheat exclusively for pastry purposes. As good for pastry as Cream of the West is for bread.

Farmers' Clubs are invited to write us for quotations on flour, cereals and feed. We are supplying many such clubs satisfactorily.

The Campbell Flour Mills Co., Ltd.

(West) TORONTO, CANADA

group of infections, local and general, caused by pus organisms such as tonsolitis, glandular swellings, middle ear disease, maxillary abscesses, inflammation of the brain, meningitis, kidney inflammation, nephritis, inflammation of membranes of the joints, rheumatism, etc. Authorities are beginning to believe that rheumatism is due to a chronic infection in some part of the body.

The important fact to be recognized is that one and all of the varions conditions are poisonous in their nature. The cause underlying them is mouth poisoning of the marked character and is particularly virulent, for it is connected with decaying and diseased teeth. Pathological experiments have proved that no pus organisms are so virulent as those grown in dead bone.

It is urgent in the interest of many sufferers that some steps be taken to prevent prevailing conditions of the mouth. It may not be possible to prevent access of the organisms to the mouth any more than we can prevent their adhering to the skin, but the mouth should not be allowed to become a perfect hot bed of disease.

Dr. Atkins, of the British Dental Association has well said: "The health of the nation would be vastly improved, were some wholesale provision made for dealing with the teeth of the poor for there is a much closer connection than most people suspect between decayed teeth and disease."

Dental work and instruction in the care of the teeth offers those who receive it, the one thing necessary to make them appreciate its importance. When we consider that the mouth is the very gateway to the body and the teeth the machinery which must prepare the foods for the system's nourishment, and that upon one's bodily resistance to the attacks of disease depends his healthful condition, we can begin to realize that no force is so vital as that of the teeth and proper mastication.

Oral prophylaxis, preventive care of the mouth, consists of a thorough scaling of the teeth, the removal of accumulated decomposing food and matter between and around the teeth, cleansing and purifying every space and surface in the oral cavity. Treatments when given regularly, at appointed times, will destroy all plague-forming micro-organisms (which cause decay of the teeth) changing a disease-producing environment to one where disease and caries cannot thrive.

Health.

Licking postage stamps.—Licking a postage stamp may be the first step towards a tuberculosis camp, and chewing a pencil that somebody else may have used, bear all the possibilities of an early funeral for the chewer. These are conclusions to be drawn from a recent address by Dr. Samuel G. Dixon, State Health Commissioner of Pennsylvania. Millions of people moisten postage stamps with their tongues every day. These may have been shoved across a soiled counter or torn off with dirty hands an instant before, but, unfortunately, a habit, plus convenience, leads the majority of people to the custom of affixing them in this manner. In view of the fact that there are thousands of sufferers from tuberculosis and other diseases, these seemingly insignificant acts are always fraught with danger.

Dr. Olsen on Tobacco.— Writing in "Good Health", Dr. Olsen says: "At the present time the yearly consumption of tobacco amounts to about one hundred million pounds, or something like two pounds per head. The total cost of this large amount of tobacco is £30,000,000 in round numbers, which would be sufficient to build and equip ten Dreadnoughts yearly." Dr. Olsen says tobacco is a poison and its influence on the human body is always poisonous, the effect differing only in proportion to the amount taken and the susceptibility of the user. No one, he says, can honestly claim that the habitual use of tobacco in any quantity, small or large, benefits health, increases strength, prolongs life, or in any other way exerts a healing influence upon the human body.

The Wash Rag.—Frequently the same washrag is used by the entire family, thus affording an easy means of transmitting infection. In many households each individual has his own wash-cloth and his individual towel, but these hang so close to one another that there is ready interchange of the bacteria. Each individual should have his own wash-cloth. It should be thoroughly washed out with clean hot water after use. It should be then wrung as nearly dry as possible, and, if possible, hung in the sun to dry. It should not come in contact with other wash-rags. Colds and otherf chest troubles often spread through a family, because the one towel is common property.

Eat an apple.—"Eat an apple a day" is the advice given by Mr. O. H. Benson, a federal apple expert. "Apples are one of the most healthful foods obtainable," declares Mr. Benson. "Instead of taking patent medicines, eat apples. That advice followed would save thousands of dollars in doctor's and dentists' bills. "One physician I knew, says Miss Susan Walker, of the Harper Hospital, Detroit, "urged his two children to eat two apples each two hours after breakfast. They are rosy, plump, splendidly robust youngsters and the father lays the credit at the door of the apples. Apples give the need bulk to the food. If the skins can be digested, even they are good, for they increase the bulk necessary for proper food assimilation and health. The individual should study his or her idiosyncrasies, discover just the proper time to eat the fruit and the quantity to take, and then—'eat apples.'"

For Delicate Children

By Powerful Nutrients, Hypophosphites, Nerve Restoratives, Valuable Stomachics.

OF NERVOUS TENDENCY GIVE DR. CASSELL'S TABLETS.

Strengthen, Build up, and Nourish the Children, and you are conferring incalculable benefits on the country. You are also ensuring the physical well-being and success of future breadwinners and mothers.

Dr. Cassell's Tablets, whose success in Canada has been both immediate and striking, owes its popularity in great part to its safety and unquestionable medicinal activity. It is now doing more for the little ones of three continents than many mothers realise.

A powerfully nutritive food-medicine which can be given to the youngest infant, Dr. Cassell's Tablets feed the entire system, vitalise the nerves, and create healthy flesh, blood, and muscle in a manner truly remarkable.

They are the recognised modern home remedy for Nervous Breakdown, Nerve and Spinal Paralysis, Infantile Paralysis, Rickets, St. Vitus' Dance, Anæmia, Sleeplessness, Kidney Disease, Dyspepsia, Stomach Catarrh, Brain Fag, Headache, Palpitation, Wasting Diseases, Vital Exhaustion, Loss of Flesh, and Premature Decay. Specially valuable for Nursing Mothers and during the Critical Periods of Life.

Druggists and Dealers throughout Canada sell Dr. Cassell's Tablets. If not procurable in your city send to the sole agents, Harold F. Was Not Much of a Believer in Patent Medicines

But Milburn's Heart and Nerve Pills Are All Right.

Mrs. Wm. McElwain, Temperance Vale, N.B., writes: "I am not much of a believer in medicines, but I must say Milburn's Heart and Nerve Pills are all right. Some years ago I was troubled with smothering spells. In the night I would waken up with my breath all gone and think I never would get it back. I was telling a friend of my trouble, and he advised me to try Milburn's Heart and Nerve Pills. He gave me a box, and I had only taken a few of them when I could sleep all night without any trouble. I did not finish the box until some years after when I felt my trouble coming back, so I took the rest of them and they cured me."

Milburn's Heart and Nerve Pills have been on the market for the past twenty-five years. The testimony of the users should be enough to convince you that what we claim for them is true. H. and N. Pills are 50c per box, 3 boxes for $1.25; at all druggists or dealers, mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

We have been using MINARD'S LINIMENT in our home for a number of years and use no other Liniment but MINARD'S, and we can recommend it highly for sprains, bruises, pains or tightness of the chest, soreness of the throat, headache or anything of that sort. We will not be without it one single day, for we get a new bottle before the other is all used. I can recommend it highly to anyone.

Two on a Rancho

(Continued from Page 393).

"I'm such a fool; but the old songs always make me sad," she said. "Why, I don't know, for I have nothing to regret. I am far happier now than I've ever been in my life."

Then he, too, came out of the past with a shrug, for he was honest enough to admit to himself that the day had brought him much.

"It isn't half bad here, is it? I never thought I could stand living away from where things were being done. But I suppose it is because I realize now that it doesn't make any difference."

His bitterness had to crop out, but he was immediately ashamed of it, and glanced at her contritely. She was smiling at him, but it wasn't the smile which made him stare. There was about her something intangible, subtle, disturbingly sphinxlike. It hinted a secret that he could not guess. He was still pondering it when he fell to sleep that night.

He was fated to be troubled by it many times thereafter. When the reaction came from his interest in the maps that he was making of the whole district, with a view to irrigation, and the bitter realization of the hopelessness of all his efforts welled up in him, he would start up with a groan and pace the floor, biting his lips, after his habit.

"Just think of all I could do, could do; just think! Look at all that land! It could be bought for a song and developed into one of the greatest irrigated projects in the Southwest. The supply of water is inexhaustible!"

He would glare at her as if she were to blame for it all, only to find the strange smile on hr lips, the almost mocking smile which he was too proud to ask her to explain. Angrily he would go off on long climbs, until the exertion stifled the heat within him.

She, too, found much to occupy her while he was thus finding respite from himself. Flowers followed flowers the whole winter through in that wonder country, and her interest in the tiny growing things never seemed to abate.

Very capable she looked, striding here and there in her short skirts. Her sleeves were rolled high on her well-browned arms, and about her hips was the holster carrying the little pistol which he had given her, and with which constant practise had made her surprisingly proficient. They were very busy, those two, and very happy, for he, at least, had forgotten the days.

Winter melted into spring—a change almost unrecognizable, and only marked by the red and yellow glories of the cactus and the northward passage of the birds. First came the geese, plaintive, disembodied cries high in the night, stirring Barlow strangely with vague desires of unrest. Yet it was not the wander call; he did not want to leave the rancho, for it had become too much a part of him, of all the dreams that he had planned. He found himself watching Jane; and when he caught the glow in her eyes, as she tended her little growing things, the unrest was stronger to him than ever.

Ducks followed the geese, black lines swerving through the mists of dawn like the ghostly arms of witches caught by the day. The sand-hill cranes, huge and harsh-voiced, were followed by the plovers, the bull-bats and the killdees. Everywhere there was a feeling of movement, of change. Barlow had sudden moments of action and sudden moments of lassitude; not the old bodily weariness, but a warm, lethargic deliciousness.

He lay awake at nights in a half-dreamy stupor; but when he would hear Jane stir in her room across the patio, he would lift himself on his elbow and listen breathlessly, conscious of the quickened pulse-beat. The undercurrent of bitterness in his heart rarely welled up any more. He had forgotten the passage of the days!

Sample List of Bargains in Organs and Pianos

This is just a few of our Bargains—just to give you an idea of the snaps we are offering on easy terms. We have many, many more and all in first class condition—guaranteed. Mail coupon today filling in the kind of instrument you like. We will mail you a big list to choose from—giving full description, price and terms.

ONE MAN WITH A **Kirstin** STUMP PULLER

Quickest-Cheapest-Best Way To Clear Stump Land

The Kirstin way of land clearing is the easy, sensible, practical, economical way. Small investment to start with—no extra cost for help, because one man alone operates the Kirstin with ease, pulling out the biggest, toughest kind of stumps in less time than by any other method. With brush, hedges, small stumps, saplings, etc., you "yank 'em out" in bunches. Clear an acre from one anchor.

The "KIRSTIN" Improved Double Leverage Model

has enormous strength and power. Until you see a Kirstin at work you cannot realize what wonderful power is developed by our system of compound leverage. The work positively is easier, to say nothing of being quicker and cheaper than with the cumbersome hand power pullers or the big horse-power pullers that require a team and two or three men to operate.

Our Quick-Detachable Connections, Auto Release, Non-Twisting Cable and other special patented features put the Kirstin in a class by itself. Endorsed by Government and State officials. Used by the thousands all over the world. Holds record for lowest land clearing costs.

Write Today For Big New Catalog

which explains all about the Kirstin, tells best way to clear land, describes Kirstin Service, Liberal Try-out Offer, Easy Payments, etc. Get this book before you buy a stump puller. Write today—now. *Agents Wanted*

A. J. KIRSTIN CANADIAN COMPANY,
6004 Dennis St., - Sault Ste Marie, Ont.

One evening, just when April was coyly fading into May, Miguel appeared before his employer so evasive and general in his remarks that Barlow knew a request was forthcoming.

"Well, what is it?" he demanded.

The Mexican, thus abruptly halted in his natural mode of procedure, explained with some embarrassment.

"There is fiesta at Alfores, senor, tomorrow. Very holy day for the good Saint Miguel, for whom I am named. Anna and I would like to go for two, t'ree days."

"Anna? But what on earth would we eat if Anna goes away?"

"'I can cook," Jane broke in quickly. "We all had to learn to cook at the hospital. Please let them go, Gordon. I—I'd just love to cook for you—for a while!"

He surprised the glow in her eyes, and turned his face away quickly. Almost—almost he had read the meaning of it. It seemed to dangle just before his eyes, visible, but too close to make out its nature.

"Go ahead, Miguel," he said gruffly, "Go ahead and stay as long as you like."

Lunch proved her culinary prowess to be no empty boast. The omelet was as light and creamy as a cloud, and the biscuits even more airy, if possible. At his admiring compliments she flushed delightedly, flushed and looked at him, and again his gaze shifted. The secret was close, but still too close!

That afternoon, as he sat over his maps, and Jane was as industrious as usual in the garden, he began to see, only dimly at first, for its was so stupendous that he could not readily believe. He had watched her for some time, and as he watched the truth began to rise before him. Up and down the beds she moved, bending lovingly over the plants. Her movements were supple, graceful, and assured. The contour of her body, as she bent, was round and womanly. With a shock he realized that the harsh angles had gone, and with them the old, stiff movements of her weakness. Even from where he was, he could see the clear, healthy brown of her cheeks, and the full column of her throat, which had once been so thin and knotty.

The discovery was really too big for instant realization, and he sought the key through his old method of action. With his head bent in thought he strolled down the slope to the clear stream in the bottom of the arroyo. Here he found a boulder beside the water, and sat down, for his knees had suddenly become weak and trembling.

She loved to see things grow, she had said—little things! He had scoffed openly, had inwardly boiled at such sentiment; but now for the first time he came to realize. It was her nature. She was a woman; and he was a man, and her husband.

Then there came to mind the healthy brown of her cheeks and the rounded curves of her body. The old unrest that stirred him when he heard her toss in the night in her room across the patio, gripped him like a vise.

And then all thought fled before a swift rush of fear, for the regular movement shadowed in the water, which he had been watching unseeingly for some moments, thinking it but the waving of a weed in the wind on the cliff above, resolved itself into its true reality. It was the tail of a jaguar, outlined against the sky as it crouched there above him.

Slowly his eyes lifted and looked into the green eyes of the beast. Even in the stress of the moment he noticed the animal's thin ribs, and in its eyes he seemed to read an almost insane desire. He remembered Miguel's words:

"Sometimes, when he hongry, man."

The great cat was crouched as if about to leap; but suddenly the green eyes shifted to the trail above. Barlow's own gaze, freed from their almost hypnotic power, fell to the water again. There in the perfect mirror was another figure, slender but rounded, standing above and behind him, in her outstretched hand the little pistol he had given her.

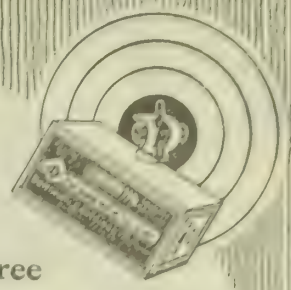
Even as he looked, the report rang out. The jaguar wailed aloud in sudden hurt and anger, leaped and clawed the earth, then leaped again, and was gone, a long, low streak of yellow, hardly distinguishable against the drab hillside.

Barlow turned back to his wife. Grasping hands, they rushed without a word to the hilltop and the gate of the hacienda.

His escape from the jaguar was belittled at this moment by a new realization that had come upon him. His eyes were wide with wonder.

"Jane," he stammered, "do you realize that we ran up that hill—ran!

No Matter What You Want to Shoot



Dominion Ammunition meets every requirement of the sportsman. It has speed, accuracy and reliability, the three factors necessary to perfect ammunition.

Dominion Ammunition

for small game or big, for target shooting or at the traps answers the ammunition question completely. Whether it's the powerful 303, a 22, one of the fast Shot Shells, or the other popular sizes, insist on the box with the big "D". It's the trade mark of Made-in-Canada ammunition that gives perfect shooting results.

McDonald's TESTED SEEDS TRUE VIGOROUS RELIABLE

Poor Seeds Waste Land, Time, Labour and Money

THE COST of seeds is a small fraction of the cost of a crop—but upon the quality and vigor of the seeds depends the size of that crop. **McDonald's Tested Seeds** give maximum productiveness for the land, labour and money that are used to cultivate them. They are "seeds with a pedigree"—selected strains, chosen for yield and vigor, and are subjected to rigid germination tests before being passed for sale to our customers.

CATALOGUE FREE UPON REQUEST ::

Our Fortieth Annual Seed Catalogue is ready for delivery. It describes and illustrates hundreds of varieties of seeds, with suggestions for their proper cultivation, and contains information of real value in helping the farmer or gardener plan his planting.
A copy will be sent free upon request—simply say "Send Your Seed Catalogue" on a postcard, with name and address, and your catalogue will go forward by return mail.

When we first came here, it was all that we could do to walk up it."

She smiled the cryptic smile that had so disconcerted him.

"'Silly, don't you know that the six months were over long ago, and that neither of us has coughed since Easter?"

His jaw dropped, and then the fierce, mad joy that burned through his veins brought the secret clear before him.

" of course, of course! You're brown, you're round, you're healthy."

His arm went about her waist, as if to prove it. He saw the glow in her eyes, and he knew what that was now, too— what it held for him and for the little things that grow.

"Jane," he babbled, "I'm going to kiss you!"

And he did.

County Vice-Presidents' Reports At the N. B. F. & D. A.

(Continued from page 379.)

think, and we feel that something should be done quickly to protect the sheep raisers. We would suggest that a tax be placed on all dogs in the county, to be collected by the regular tax collector. The money to go towards a fund to reimburse farmers who have lost sheep. This might put a stop to many useless curs being kept.

W. C. GALLOWAY,
Vice-Pres. Chatham Co., N.B.

QUEENS.

I thnk Queen's Co. is counted as one of the Lumbering and Mning Counties of the Province. This is taken by many as a good reason, or, at least, an apology for the fact that we are slow on farming. If the people of our country are prosperous, what difference how they make their money? Isn't a dollar from the mine, or the railroad, or the lumber business just as good as a dollar extracted from the soil. If you work in a mill or a mine you don't have to wait a year for your pay, you get your money quickly—yes and you generally get clear of it quicker too. More lively every way than farming. A good many even get to the end of the journey long bfeore the farmer does. Then—if there is any life insurance, the money is immediately put into circulation. This is business.

But Farming ! ! Farming ! !

I have been asked by this Association to report on agricultural conditions in my community, noting any visible improvements in stock and the farming business in general. I may say that if you can accept what I have already said as an indication of what the majority of our people are thinking, then I am sure you will be prepared to hear a report of little improvement in the farming line.

The crops the past year were light —why? Partly, of course, on account of unfavorable climatic conditions, but mainly I believe on account of lack of drainage and through cultivation. Keeping horses to work all summer is a lesson we haven't leraned yet. That Queen's Co. had not a better and a larger harvest last fall was not all the fault of providence. There's a little book published now called "Seasonable Hints"—one of the efforts of the Government to stir the farmer.

There is also an old book, that we all have access to, with many "Seasonable Hints" in it for the farmer—let me give you one or two.

"He that tilleth his land shall be satisfied with bread." "He which soweth sparingly shall reap also sparingly."

I saw posted up in a business office onece, this: "A Hint is better than a kick."

It would almost seem that in the case of the farmer that should be reversed.

The "Hint" hasen't operated in very many cases. It has come to us from public speakers employed by the Government, in many cases splendid practical men, full of enthusiasm over the prospects for the farmer.

It comes to us in the form of reports from Experimental farms, giving the results of years of testing, demonstrating the advantage of "Seed selection, rotation of crops, thorough cultivation, growing clover, purebred stock, etc., etc."

Few have taken the "Hint." It may be that the "Kick" Germany is putting up will have more effect . That necessity will compel more attention to farming. Somtimes drastic measures are necessary to reform. War conditions call for a change. The slogan "Business as Usual" had to be dropped in England. W have no right to continue our "Business as Usual." For a good many young men at this time, the fact of their fitness for military service settles pretty clearly the question as to their duty. I think some may face this question squarely and honsetly and still not "Enlist," but we ought to be able to say of such men that they are rendering better service to their King and country by remaining at home. War conditions call for a change. Many farmers in our county could not plead the importance of their business as a good reason for not going to the front.

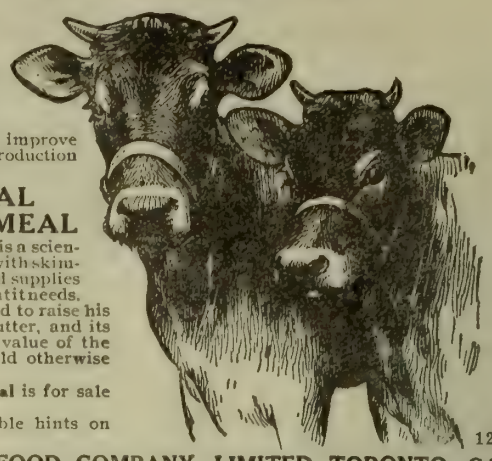
There is every incentive to do better farming. Just now, in the first place, it pays. I have farmed for thirty years in Chipman and can say without any hesitation that I find conditions for the farmer continually improving.

One of the main features of improvement I would note is that we can now generaly get cash for what we have to sell, and if we have a first class article we can set the price, and get it. This is gratifying to any farmer, but is especially important in the way of encouragement to the enterprising boy in the farm home. There is nothing quite so convincing to the boy that farming is a good business, as getting a good price for what he has raised on the farm and getting the money himself.

We hear a good deal these days about agricultural education, and some

SELL YOUR MILK

MANY a farmer who would like to raise his calves is prevented by the amount of milk necessary to feed them. By raising them he could select the best of the stock and improve the standard of milk or beef production of his herd.



INTERNATIONAL GROFAST CALF-MEAL

solves the problem for him. It is a scientific preparation which, mixed with skim-milk, takes the place of milk and supplies to the calf every food element that it needs.

By its use the farmer is enabled to raise his calves and sell his cream or butter, and its cost is a trifle compared to the value of the whole milk that the calf would otherwise need.

International Grofast Calf-Meal is for sale by dealers everywhere.

Write for our book of valuable hints on raising calves—free.

122

INTERNATIONAL STOCK FOOD COMPANY, LIMITED, TORONTO, CAN.

Spraying Pays

SAVES your crop from loss, helps tree and plant to produce better and larger crops, prevents spread of disease, insures a longer life for trees and a longer growing time for vines each year: Blight hit potatoes in many states in 1915—many million bushels lost. Spraying would have saved them.

IRON AGE Sprayers

Include bucket, barrel, power and potato sprayers in many sizes and variety of equipment to suit each man's needs. We want to show you what each one is, how they are made and what they will do: Ask your dealer to show you these tools and write us for booklet describing all of them fully. We also have a spraying guide which we are glad to send.

wise ones claim that the hope of the farming industry is in the country schools, when the instruction in those schools is as it ought to be.

I havent' a word to say against that doctrine, but I have this to say in closing. I hope that we as members of this Association, many of us farmers in middle life, I hope that we are not going to sit down and wait for the next generation to do what we can do now if we will. We owe much to the older men of this Association, and to others who unselfishly labored to stimulate more interest in farming. We are reaping the benefit of their labors. We have privileges and opportunities that did not come by chance.

A man who had once been greatly helped by a friend, said to his benefactor, how can I ever repay you; and the friend replied, Pass it on to others.

How are we to pay what we owe? Can't we do it by showing more enthusiasm in our farm work. Can't we do it by making the best in the community in which we live? Can't we do it by making the home life such that the boys and girls will be convinced that there's "no place like home"—a farm home? Can't we demonstrate to them the truth which they are now being taught at school, and which the newspapers are now proclaiming—that the business of farming is the most important and one of the most honorable and independent and pleasant occupations in Canada?

I think we can.

ISAAC W. BAIRD,
Chipman, N.B.

RESTIGOUCHE.

Mr. President and Members of the Farmers' and Dairymen's Association.

On behalf of Addington Agriculture Society No. 1, in the absence of the County Vice-President, I am obliged to make a very brief report. Just a few words in behalf of our Society and a general report of crops for last season.

The Society through the Sec. of Agriculture imported about eighty bushels of seed what for the benefit of our farmers which gave good yields, an average of twenty bushels per acre. We also imported between 800 and 900 bushels of oats which turned out very satisfactory. The Society also has purchased a pure bred Percheron stallion that is being used in the Society to encourage the raising of large draft horses, which find a ready sale in our district.

Th Society has also imported and sold within the County during the last year or two. pure bred dairy stock. I am pleased to be able to say that we have within our Society one of the best dairy herds in the province of its size. We hope to continue this work in the future and assist our farmers in any way possible.

D. G. STEWART.

SAINT JOHN.

Mr. President and Members of the Farmers' and Dairymen's Association.

As one of your Vice-Presidents for St. John C., I have been asked by the Association, through the corresponding secretary to make a report of the crops, of the live stock, of the improvements of agriculture in our County for 1915.

A report to be of value would require an amount of time and research that was not at my disposal. I may say as far as my knowledge goes, they were about the same in St. John Co. as prevailed over the larger part of th Province.

And, second, to give an opinion on the best methods to improve the present methods of growing crops. My! If I only could answer it. It is to large a question for me. I will venture a few suggestions. There are so many soils and conditions to be found even on one farm that each field and plot requires a study to find out what it needs, and what kind of a crop will do best. Our Dominions and Provincial Departments of Agriculture are only too pleased to give us any information that will help us. With a proper rotation of crops and our one-horse-sense I think will give us the best results.

Local conditions around St. John have changed very much these last few years. Many of the farms have been sold for sub-divisions—and sold for good prices, and a large number of houses have been built within the one, two and three mile circles around the city. Owing to the great development work being done at Courntey Bay and on the west side. The amount of work being done and the steady increase of the winter port shipping and the necessary large expenditures have increased the population to a large extent, which will make a larger near market for the products of this Province. I may say there are many good farms within the three, four and five mile circles around the city suitable for milk farms, market gardening, strawberry, small fruit and poultry raising. They can be procured now, not at boon prices. Should any farmer contemplate making a change it would be well to look after the different prospects.

Of course since the great war started our thoughts and minds have been turned into new channels. We are realizing that we are living in the greatest period the world has ever seen, and that each of us has a part to play with its resposibilities. Do we ask ourselves, are we doing our best to run and boss our little jobs, to make the best of them? that we may have ample for our families and a generous amount to give to those who are fighting to maintain our liberties and the great battles for Right, Justice and the World's Peace, which I think we will live to see established for all time.

R. R. PATCHELL.

SUNBURY.

Maugerville, N.B., Feb. 29th, 1916.

Mr. President and Members of the New Brunswick Farmers' and Dairymen's Association:—Greetings from the old county of Sunbury. As you are all aware our beloved country is at war. This condition of things causes the labor problem for the farmers to become more acute as time goes on. On account of this, many farmers are unable to produce as much as they would like to. Yet we would not call the young men back from the front if we could. We believe that they are fighting to save us from a life that would be worse than slavery if the Germans should win. But I firmly believe that the Germans will not win.

Coming back to the work of the farm, I think, generally speaking, that we farmers have very little to complain of on the past year's operations. Although we had a very cold, wet and backward spring for seeding, yet later on the weather became more favorable for plant growth. We had a good haying season, and a fine fall for harvesting the other crops. The crops with but few exceptions, were well up to the average. The potato crop was very light, and disappointing to a large number of farmers, but the prices for them are so high that it makes up to a large extent for the

The Glory of the Garden.

There's not a pair of legs so thin,
there's not a head so thick,
Theres' not a hand so weak and white,
nor yet a heart so sick,
But it can find some needful job that's
crying to be done,
For the Glory of the Garden glorifieth
every one.

Then seek your job with thankfulness
and work till further orders,
If it's only netting strawberries or
killing slugs on borders;
And when your back stops aching and
your hands begin to harden,
You will find yourself a partner in the
Glory of the Garden.

Oh, Adam was a gardener, and God
who made him sees
That half a proper gardener's work
is done upon his knees,
So when your work is finished, you can
wash your hands and pray
For the Glory of the Garden that it
may not pass away!
And the Glory of the Garden it shall
never pass away!

—Rudyard Kipling.

Potatoes for Pigs.

The past season has produced a good deal of disease in the potato crop. Diseased tubers, unless in a state of decomposition, will be no harm to pigs. Good sound potatoes are too valuable for pig food, but the small ones and those attacked by disease may be utilized for the pig pen. Potatoes should never be given uncooked. When first got out of the ground it does not matter so much, but in the skin of the potato more especially, and more or less through the whole tuber, is a poisonous substance called solanine. The older the skin gets, the more there is of this, particularly if at all green. Cooking disperses nearly all, if not all, of this; a great deal is taken up by the water, and on this account water in which potatoes have been boiled should always be thrown away. Steaming is preferable to boiling, as there is then no chance of a careless person giving the water to the pigs. Potatoes like turnips, may be boiled down, and kept for a long time, and when a large quantity is affected by disease this is the only way of utilizing them. When steamed, break them up, and put in a large wooden tub—a treacle hogshead is good—and, when the tub is nearly filled up, saturate the mass with kitchen slop, taking care there is always an inch or so of liquid on the top, and the potatoes will keep for many weeks. When, however, potatoes are sound, no paln of feeding is more economical than giving them freshly cooked each day.

Small Breeders Sales.

The Maritime Farmer receives many letters which read something like this:

"Dear Sir:—Kindly discontinue my one cent a word advertisement. I have disposed of all my stock of ——— which I advertised in the Maritime Farmer. I have had orders for more than I can supply.

"When I next have anything to sell I will certainly use the Maritime Farmer's one cent a word ad.

"Yours truly,"

At this season of the year there are scores of poultry breeders who will find the Maritime Farmer's one cent a word advertisements the greatest sales organization in the Maritime Provinces.

Although the advertisements are cheap, they are none the less effective. If you have used them before you will have been convinced of their worth. If you have not been a user of the Maritime Farmer's one cent a word advertisement we advise you to try them.

The Great British Remedy.

COUGHS THAT HURT

That kind of cough must be stopped, and at once; it is dangerous. The severe strain it causes may have serious consequences. You can stop it—and cure it—with the World-famous British Remedy, Veno's Lightning Cough Cure. There is nothing in medicine more quick or more sure than Veno's. That is why it is called a "Lightning" cough cure.

Awarded the Grand Prix and Gold Medal, International Health Exhibition, Paris, 1910.

Veno's Lightning Cough Cure is the most popular cough remedy in the whole world. Why? Because its a real cure, quick, sure, thorough because it is free from every kind of poisonous or dangerous drug; because it is as good for children as for adults; because a better preparation could not be made, if the price were dollars instead of cents. Trust Veno's in the treatment of—

Arostook's First Potato Shipment.

To Columbus Hayford of Presque Isle belongs the credit of growing the first potatoes shipped out of Maine. This occurred in 1872 or 1873, the year that the potato crop failed in about every state in the Union.

Mr. Hayford harvested that year, from three acres, 1050 bushels, an unheard of crop of tubers, in even that new country. It is interesting to know just how the land was prepared for this crop. Winter wheat had not been grown in the country, and wishing to try the experiment, he carefully prepared three acres of land and sowed the wheat. In May a careful inspection of the field showed here and there a spear of wheat, but not nearly enough to warrant a profitable stand later. Not at all discouraged, Mr. Hayford turned the soil of the wheat field over and planted it to potatoes, the 1050-bushel yield being the result.

This was a burdensome product, far from railroad or seaport, but fortune favored him to some extent, inasmuch as there being an Aroostook boy, an acquaintance of Mr. Hayford, employed in Boston, where potatoes could not be procured at any price, he was sent down to Maine to see if he could buy a few potatoes. He went directly to Mr. Hayford, bought 200 bushels, paying 60c per bushel. These were hauled to the Aroostook river, loaded on boats and shipped down the river to Tobique, where they were transferred to another boat and sent down the St. John to Fredericton. Here they were again reloaded and shipped to Boston, where they brought an almost fabulous price.

The facts as here related do not exactly agree with the statement made in the Question Box a few weeks ago, but as this is Mr. Hayford's own story, we are pleased to publish it.—Maine Farmer.

Thick wind or Whistling.

I bought a horse a few months ago fully guaranteed as to soundness that makes considerable noise and has some difficulty in breathing when he is made to pull a load up a grade; when stopped he quickly gets his breath. Is he sound? Should the toe be short or long where ankles are cocked or knuckled?—O. K.

I should not call this horse sound, although the difficulty may be no more serious than a thickening of the membranes of the throat, causing difficulty in breathing when a large amount of air is needed. I suspect it to be a mild case of roaring or whistling, which will very probably grow no better with hard work. In case of knuckling or recent development benefit is often given by cutting heel short and allowing the toe to grow, thus throwing the fetlock back into place, but in cases of long standing it is probable that best results are obtained by the reverse treatment; that is, cut the toe short and keep the heel long, thus relieving the strain.

Percent of pure Blood in Grades.

What percent pure Clydesdale will the foal of a three-fourth Clydesdale mare be bred to a purebred Clydesdale stallion?

This question is a more difficult one to answer than might be supposed from a hasty examination of the facts. In everyday practice one would say without much hesitation that the foal of a three-quarters Clydesdale stallion is a seven-eigths or 87.5 percent pure Clydesdale. We calculate this by simply taking an average between the blood concentration of the two parents involved. For instance, if we cross a grade mare to a pure Clydesdale sire, we add 0 percent to 100 per cent and divide by two. Hence, we say the foal so produced is 50 per cent pure. If we then mate this 50 percent pure animal to a pure Clyde sire, we add 50 percent to 100 per cent and again divide by 2, giving us 75 per cent. This process can be carried out indefinitely in this manner. However, in order not to mislead, we must say that the expression "a seven-eights pure Clyde" is a sort of general term, and signifies only that 7 of its 8 grandparents were eligible to registration. A seven-eights Clydesdale may on the one hand be no better than a one-half Clydedale, or, on the other hand, it may be as good as a pure Clydesdale for breeding purposes. The generations produced by grading show much variability, the earlier ones usually being the more variable; and so we cannot always say that any particular seven-eighths Clydesdale is just as good as any other seven-eighths Clydesdale for breeding purposes just because they are all called "seven-eighths.'. One must select the best of a given geneartion in order to make the most progress in grading up.—J. A. Detlefsen, Illinois Experiment Station.

CP

County Vice Presidents' Reports at the N. B. F. and D. A.

(Continued from page 399.)

small crop. The same conditions applies to the apple crop, also to the small fruits.

Apple growing is on the increase in the county. We have quite a number of large commercial orchards, and on most of the farms will be found a few apple trees. As regards the small fruits, very few pay any attention to them (except to eat them.)

The hay crop was very good, and the prices for it away above the average. So much for the crops.

I will now say a few words on stock raising. As far as I have been able to find out, there is a marked improvement the last few years, more pure bred males being used than there used to be. In the past we make a mistake (I am refering now to the average farmer) in not choosing a certain breed and sticking to that breed. We mixed the breeds up too much for our own good and profit. I am glad to see that this mistake is being remedied. I believe the average farmer does not keep enough stock, for the "land's sake" at least. On account of this many farms do not produce more than one-half that they should. Many of us have depended too much on artificial fertilizers. Too little attention is paid to the dairying industry. In my experience, dairying and hog raising are far more profitable than beef raising.

Of course, dairying keeps one tied at home, of which fact a good many men object to. Nevertheless I would like to see a good many more cows in the county, for I believe that in the keeping of cows and pigs, the fertility of the soil will be raised to a much higher state of production. This means more profit for the farmer.

The outlook for this year is good. Now is the time to plan our next season's operations, so as to have our work well in hand. We should all try to increase crop production as much as we can, and to make two blades of growth in the place of where one grows at the present time.

I regret very much that I am unable to attend the meetings of the association. Hoping you will have a very successful convention. I will now close my report. I remain, yours in the interest of the work of the Association.

ERNEST C. BURPEE,
Vice-President for the County of Sunbury.

WESTMORLAND COUNTY.

To the President and Members of the Farmers' and Dairymen's Association of New Brunswick.
Gentlemen:—

As Vice-President for the County of Westmorland I am pleased to report as follows:

The Spring of 1915 was late for seeding, but favorable for grass. The new seedeed started strong with an abundant catch of clover; the old meadows in the absence of winter killed got a good start, and with the moist weather through June and July gave a good growth of grass, giving the farmers one of the largest crops of hay in the history of the County.

Seeding was late; farming not being general until about the first week in June. There was not as much wheat sown as usual owing to the late spring, but what was sown was a fair yield; the crop being about one-third short of the average. Early oats was a fair crop, yielding well, but the later sown failed to mature and had to be cut as green feed.

Barley was sown to a greater extent than usual, doing much to make up for the shortage in the oat crop. Buckwheat was about an average crop. Potatoes were about half a crop. but of excellent qquality and are reported to be keeping well.

Turnips were a light crop. There is much hay being shipped from the County, and while it is bringing in a lot of money to the farmers, I think it would be more profitable to keep more cattle and sheep and sell less hay, thus increasing the fertility of the soil.

There is considerable fertilizer used in our County with varied results. Slag appears to be the most popular of any grade of fertilizer used. The chemicals bought from the Agricultural Societies United and mixed at home gave decidedly better results than factory mixed fertilizer, especially the potato fertilizer, which saved the farmers about $15.00 a ton, and gave better results.

Dairying in our County has not advanced as fast as it should; partly due to the neglect given to the dairy cow, and partly for the want of labor on the farm. We would recommend our Department of Apriculture to instill in the farmers a greater desire for dairying, as we believe it to be the backbone of the farming industry.

We would also ask our Department of Agriculture to provide some measure so that each dairyman's butter would be known in the market and condemned or accepted as his individual product, giving the good article the preference it deserves in the market.

The standing crop competition carried on in our County has been a decided success and has done much to improve the standard of our seed grains.

Our Local Exhibitions have shown vast improvements in the last few years, particularly the Botsford and Westmorland Agricultural Society, which leads our county in everything except beef cattle.

There was more than the usual amount of ploughing done last fall, denoting the intention of the farmers to grow larger crops than in any previous year, and help supply the Empire with food.

In conclusion we thank the Agricultural Department for the able men then sent out to lecture and demonstarte to us on general farming.

J. F. REILLY,
Melrose, N.B.,
February 28th, 1916.

YORK COUNTY.

Mr. Chairman and Members of the Farmers' and Dairymen's Association.

I herein make my annual report for 1915:—

The winter was mild with very little snow.

Spring opened early but the weather proved cold and wet, making seeding late.

Many of the seed potatoes rotted in the row. In some fields the loss was fully 50 per cent.

Grain suffered a good deal from the wet, especially in flat or undrained lands.

Grass made a good showing early in the season, but did not come up to the average in the harvesting. The absence of clover was very noticeable all over the County. The grain crop was light. Oats and barley were of good quality, but buckwheat was almost a failure. Wheat, while not extensively grown, showed a large increase over previous years.

Potatoes were only about half a crop. A few farmers received good yields. In making inquiries you would generally find that, in case of a large yield, the Bordeaux mixture was used, which is a good preventive of rust.

Turnips were only about two-thirds crop.

Pork and beef went on the market much thinner than common. There has been a good increase in pure bred stock throughout the County. We are commencing to find out that it pays to improve our stock and that by liberal feeding the returns are much greater than when we raised nothing but the old-fashioned scrub.

The Durham cattle are taking the lead for general purposes, followed closely by the Holstein. There are also a few Ayrshires and Jerseys. There is a decrease in the sheep industry.

I am sorry to say that there is still a lack of interest in the breeding of

"The Farm Help Problem Doesn't Bother Me"

"I am absolutely free from worry about farm help. The old-fashioned drudgery that used to make farmers old men at forty is as out of date as swallow-tail coats. The Gasoline Engine has changed it all. I can do more work sawing wood, chopping and grinding feed, watering the stock, cutting silage, filling silo, turning the grindstone, churn, separator, washing machine, etc., filling the water-tank, which gives pressure for hose for washing buggies, cleaning barn and stables, sprinkling lawn or putting out fire, with the help of my gasoline engine than I ever could with a hired man—and—just think—at how much less cost! Besides, an engine turns a lathe, a sewing machine, or an ice cream freezer. If I do want a hired man, it is twice as easy to get a good one when I have a good engine. It pays—any way you look at it." This is the talk of a prosperous farmer who bought his engine and equipment from the Ontario Wind Engine & Pump Co., Limited.

Toronto Engine 1¾ h.p. to 8 h.p.

The Toronto Engine is somewhat lighter in construction than the Chapman, and sells at a lower price. It is strong, and it gives its full rated horse power. There is no work that any gasoline engine of its size can do that the Toronto Engine will not do. (1)—It has special air valve and priming cups on all large sizes. (2)—Convenient spark changing device to prevent back-firing. (3)—Efficient speed changer giving wide variation of speed without stopping engine. (4)—Automatic oiler for connecting-rod bearing. (5)—Either battery or magneto ignition or combination system as required by purchaser. (6)—The larger sizes are capable of sawing wood, grinding feed, cutting straw and corn, and threshing, as well as the lighter work, and pumping water.

Write for TORONTO ENGINE Catalog

Chapman Engine 2 h.p. to 10 h.p.

The Chapman Engine is the Big Power, Big Work Engine. It is so good that other makers try to imitate it. It has points that are patented which no other makers dare copy. It generates power in excess of its brake h.p. rating. It is the only engine with (1) a perfectly straight-line valve motion; (2) a combined suction and pump-feed fuel supply (3) a non-leakable, cast iron fuel tank; (4) a cam box containing the operating and ignition mechanism which may be easily removed; (5) fly ball governor that gives a variation of 250 r.p.m. without stopping the engine. These are not half the special features. When you buy a Chapman Engine, you are getting the best and the only one that has these numerous advantages. We would like to tell you more about the Chapman Engine.

Write us for Catalog, prices and full information

"Toronto" Silos—Made of 2 inch, creosoted, selected spruce, double tongued and grooved, with steel splices in stave butts. Doors are air-tight. Shipped complete, ready to set up. Write for descriptive folder.

"Toronto" Silage Cutters and Blowers—One of the best models of silage cutters and blowers is ours exclusively. It just fits in with our other farm help and is perfectly adapted for use with our "Chapman" or "Toronto" Engine.

"Toronto" Grinders—There is no Grinder that can surpass the "Toronto." Massive, solid frame. A special lever permits of adjustment of plates while grinder is running. The pulley is on a three-bearing shaft.

"Toronto" Saw Frames—All-steel frame, strongly braced. The table is easily swung by operator, and is so designed as to be quite safe.

"Toronto" Windmills—Run in the lightest breeze. Special easy bearings, practically noiseless, strong, high wind adjustment prevents too great speed. Toronto Windmills are called "the best." Moderately priced.

pure bred horses. The Clyde is a general favorite as a work horse. The question has been asked: What is the best method of growing crops under present conditions?

My answer would be (1st) Good clean seed. (2nd) Plenty of cultivation. (3rd) Proper rotation of crops.

I am not much in favor of buying phosphate at present prices. I believe in feeding the crops to stock of some kind. In this way the fertility of the soil can be kept up. A good clover sod will grow almost any crop with plenty of cultivation. therefore I would advise the sowing of plenty of clover seed. It is the cheapest fertilizer that we can buy.

Experimental Work in Top Grafting.

(Continued from page 383.)

that they produced nearly all clean fruit in this one of the worst scab seasons for years, leads to the belief that the experiment is worth trying on a larger scale. The data relating to the experiment is as follows:

Trees pruned April 15th.

Fameuse tree, 1½ hours removing top growth.

St. Lawrence tree, ¾ hour removing top growth.

Trees sprayed with winter spray May 10th.

Trees sprayed with summer spray May 21st.

Trees sprayed with summer spray June 3rd.

Trees sprayed with summer spray June 17th.

Trees sprayed with summer spray July 13th.

Trees sprayed with summer spray August 14th.

Fruit harvested October 14th.

Fameuse tree yielded 4½ barrels tree run.

Packing out 85% clean.

Packing out 10% large scabby.

Packing out 5% culls.

St. Lawrence, one bushel, all good.

E. Wallace in bulletin No. 335, of the Cornell Experiment Station (1913) gave some striking figures on the number of spores of apple scab discharged from parathecia on fallen leaves. He found by actual test that from a fragment of leaf one centimeter square 5630 spores were discharged in forty-five minutes after the leaf was wet. An estimate based on this and on average orchard conditions showed that if trees were set 40 feet apart each way and the ground between was covered with scabby leaves (as the ground in many orchards is) that there might be 8,107,200,000 scab spores discharged into the air for each tree in forty-five minutes of rainy weather. He also found that these spores were thrown into the air a distance varying from one-half to a little over one centimeter, giving abundant chances for air currants to scatter them about the orchard. The time of liberation of these spores he found to be just before the bloom buds opened.

From the results obtained at Cornell it would naturally follow that any means which would destroy the leaves before the spores were discharged would also prevent some of the infection, the results being in proportion to the thoroughness of the work. With the object of trying this plan as many of the leaves as possible in the Lingley orchard were raked up and burned in April of the present year. In places where weeds and grass made it hard to reach them a little kerosene was sprinkled on to make a hot quick fire. This gave a fairly good clean up, with the exceptions of a few rows of strawberries through the orchard which held leaves that could not be burned, and a railroad cutting just beside the orchard that could not be properly cleaned. Kerosene was used from a watering can this year. Another year it is planned to use a mist cattle sprayer which will cut down the quantity used.

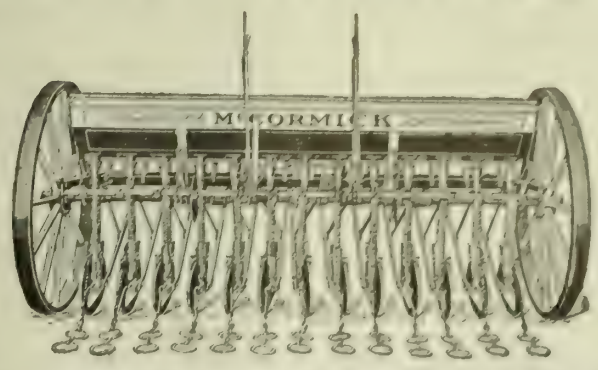
The cost of this work was as follows:

Raking and burning leaves, two men, ½ day	$2.00
6 gallons kerosene used at 20c	1.20
	$3.20

Dspite the incompleteness of the cleaning the results seem to show that it had been of value. The season of 1915 was unusually wet and dull, and in the Lingley section, near the sea, it was characterized by many foggy days. Apple scab was more than usually abundant in all orchards in the vicinity, but in the Lingley orchard the fruit was cleaner than ever before and the small amount of scab found did not appear until the first of August. In the three years 1812, 1913 and 1914, that the orchard was used for demonstration purposes it did not produce any Fameuse that were marketable. In 1915, the worst scab year of the four, it produced 18 barrels of clean fruit, a result that seems to justify a continuance of the work for another year.

The work planned for 1916 includes a more thorough cleaning out of all possible places where leaves were lodged, including the railroad cutting and adjacent roadside, hedges and fences, as well as pruning off all diseased twigs.

McCormick



Buy and Use a McCormick Drill

OF all the conditions that influence a grain crop—seed bed, planting, weather—there is none more important than planting. Your seed bed prepared, your seed selected, there is still a chance to improve the size and quality of the harvested crop by doing your planting with a **McCormick** single disk or hoe drill.

Good seed is too precious to waste. Plant it with a no-waste **McCormick** drill.

Good seed deserves the best possible chance to start and grow. A **McCormick** drill gives it that chance, by planting it in moist ground and covering it to an even depth with a protecting blanket of soil.

Good planting, such as is done by **McCormick** drills, removes many chances for crop failure, and adds to the net profits from your grain fields.

Buy and use a **McCormick** drill.

You can get one from the **McCormick** local agent, who will show you the many features that make **McCormick** drills such good planters. See the agent, or write us, and we will make it easy for you to own a **McCormick** drill.

The Trouble-Proof Roof

A roof that has stood rains, wind storms, and flying sparks for 18 years—the heat of 18 summers—the terrors of 18 winters—and is still giving service—carries its own recommendations.

There are hundreds such Paroid roofs to testify to the durability—yes, and economy—of Paroid Roofing—a roofing that can be well laid by farm help.

NEPONSET Paroid ROOFING

Paroid costs less than Shingles and is much the safer roof in case a fire is raging. Burning sparks and flying cinders do not affect a Paroid roof. Paroid is obtainable in Grey, Red and Green, and is the least expensive of all roofs on the only fair basis of comparison—service and satisfaction, and you waste no time repairing a Paroid roof.

Look for the Paroid Roll. By it you will know one of the 2,000 Neponset dealers in Canada.

BARRED PLYMOUTH ROCKS

We have for sale a few very fine Cockerels, brothers of 1st, 2nd, 3rd and 5th prize pullets at last Maritime Fair. Also two yearling cocks, selected birds from last year's stock. Eggs for hatching are now offered until midsummer.

CRAIG BROS., Amherst, N.S.

FOR SALE.

Pure bred shorthorn bulls all ages, several of excellent milking strain. Also hay in carload lots.

BLISS ANDERSON & SON,
Sackville, - - N. B.

Shorthorn Cattle.

We are offering for sale five Bulls, from six months to three years old, also some fine Heifers in calf.

FRANK C. FAWCETT,
Successor to Bliss M. Fawcett,

One Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only 1 cent a word, you can advertise anything you wish to buy, sell or exchange. The aderess must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issle. No black faced type or display of any kind will be allowed under this head, thus making a small add as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, Sussex, N. B.

WOULD YOU MARRY IF SUITED?—Best Matrimonial paper published MAILED FREE.—THE CORRESPONDENT, Toledo, Ohio.

WHITE WYANDOTTES—Bred to lay and win. Eggs, $5 00, $3.00 and $2.00 per 13, according to quality.—CLARENCE FAWCETT, Sussex, N. B.

FOR SALE.—Five trios of Regal White Wyandottes, (Cockerel and Pullets), $5.00 per trio. Eggs for setting $2.00 per 15.—L.V. MATTHEWS, St. Mary's Ferry, N. B.

FOR SALE:—Pure bred white Orppingtons & Buff Cochen eggs for Hatching write for prices. F. V. BISHOP, Kilburn N. B.

FOR SALE:—Three Ayshire bulls fit for service Calves both sex all ages. Booking orders for Yorkshire pigs. JOHN A. HUGHES, Petitcodiac, N. B.

WE WILL PAY YOU $120. for sixty days work to distribute war literature. Man or Women. Spare time may be used. Winston Co. Limited, Toronto.

WANTED.—Ladies to do plain and light sewing at home, whole or spare time; good pay; work sent any distance; charges paid. Send stamp for particulars. NATIONAL MANUFACTURING COMPANY, Montreal.

FARMS FOR SALE,—15 Eastern States; catalogue "Latest Farm Bargains", free. E. A STROUT Farm Agency, Dept 2612, 294 Washington St., Boston, Mass.

SENATOR DUNLAP STRAWBERRY PLANTS:—Booking orders now for this variety which has given general satisfaction in almost all sections and all kinds of soil, prices on application. RUFUS S. NEWCOMBE, Brooklyn Corner N. S.

FOR SALE.—One pure bred registered Guernsey Bull, now 23 months old. This Bull is a first class individual and unites the best strains of the Corning and Roper herds. Well suited for an agricultural society or private herd. Price reasonable.—W. E. READ, Bear River, N. S.

WANTED.—Man for general farm work, a good milker and one used to an axe. Must be clean, respectable and a good worker. Steady employment. Good home and food. Wages from twenty to thirty dollars per month, according to ability.—CHAS. R. PETERS, Elmhurst, Kings Co., N. B.

FOR SALE.—Now booking a few orders for Spring in the following eggs: Ring Necked Pheasants at $3 00 per doz.; Golden Pheasants at $7.00 per doz.; Lady Amheret Pheasants at $12.00 per doz.; White Pekin Ducks at $3.00 per doz.; Colored Muskovey Ducks at $4.00 per doz.; Black Cayuga Ducks at $.400 per doz.; Wild Mallards at $4.00 per doz.; Wild Black Ducks at $4 00 per doz.; African Geese at $6.00 per doz.—JOHN T. GOODFFLLOW, Chateauguay Que.

FOR SALE—My purebred Clydesdale Stallion Scotty Baldwin No 9291 Canadian National Records bred by C. Baldwin Hilkburg Ont foaled May 14 1908 weight 1650 lbs dappled brown color 4 white legs from knee down white stripe in face very neat and Stylish Action perfect disposition well broke to drive or work single and double sure foal getter parents both imported apply to J. C. STEVENS Hopewell Hill, N. B.

FREE, to stockmen and poultrymen our 80 page illustrated booklet on feeding; how to construct a house which will accomodate 100 hens; gives dimensions and measurements of every piece of lumber required Deals with the common diseases of stock and poultry and the remedies Tells how to cure roup in four days. Contains full information about Royal Purple Stock and Poultry foods and remedies.—THE W. A. JENKINS MFG CO., London, Canada.

GET YOUR NEW SUIT:—From Catesbys, London, England, for half what you pay local tailor. Best materials, style, fit guaranteed, or money back. Write for free Catalogue, self measurement form and patterns. Address CATESBYS LIMITED, CANADIAN OFFICE, 191 WELLINGTON ST. WEST. TORONTO. MENTION—Maritime Farmer.

"WANTED:—An experienced farmer capable of assuming the responsibility for taking full control of the farm owned by the Brunswick Hotel near Moncton. This consists of 40 acres of hay land and 60 of mixed farming. Salary and liberal share of profits. Address reply, J. L. McSWEENEY, P. O. BOX 1217, New York, until March 10th, then MRS. GEORGE McSWEENEY, Hotel Brunswick, Moncton."

SMALL ORCHARD FOR SALE:—On Avon River, Hantsport, Nova Scotia. Seven Acres with 60 apple trees, plums, cherries, pears, currants, raspberries, gooseberries, etc Good house four rooms down stairs, four up stairs Hot and cold water in house. Excellent summer bathing. Splendid opportunity for market gardner. Only ten minutes to churches and station. Owner's reason for selling, ill health. For further particulars, apply to W. H. SWEET, antsport, N. S.

Percheron Stallion
GLENEUR
FOR SALE !

The Imported Percheron Stallion Gleneur has stood for service in and around Sussex for five seasons, where his get are in demand at the highest prices paid for draft horses in this vicinity. He must now be sold in order to make room for another horse to mate with his fillies. His get are active, trappy fast walkers and great workers.

Gleneur is a dappled grey, weighing 1750 lbs., is nine years old, gentle and a sure stock getter. Guaranteed sound in wind and limb. If you want to buy a stallion that will improve the quality of live stock in your district and prove a good investment for you, make inquiry about Gleneur before you place your order elsewhere,

Wm. Jamieson, - - Sussex Corner, N. B.

R. O.M. and R. O. P. Holsteins

Would you like to get a good foundation? Holsteins of this calibre are seldom offered at any price, but we are overstocked and will offer::—

2 Daughters of "Ruby Nig" whose 7 day record is 567 lbs. milk, 25.60 lbs. butter; yearly record, 16,555 lbs. milk, 750 lbs. butter; the second highest record in Canada at 3 years of age.

2 Daughters of "Black Rose Beauty" whose record is 522 lbs. milk, 24.60 lbs butter in 7 days.

2 Daughters of Miss Rooker Posch, whose record is 402 lbs. milk, 16.114 lbs. butter in 7 days; 12,268 lbs. milk, 600 lbs. butter in one year, when 3 years old.

2 Daughters of Beauty Rooker, whose record at 2 years of age is 322 lbs. milk, 15½ lbs. butter in 7 days; 11,248 lbs. milk, 517 lbs. butter in one year.

And several others of equal breeding, sired by or bred to "Ida Rooker 2nds Vale," a sperior animal in every way and a proven producer of rich milkers. Also some extra nice bulls of the above breeding, all at reasonable prices.

LEA & CLARK, Victoria, P. E. I.

ELMHURST SHORTHORN STOCK FARM

Present Offerings—Six exceptionally good red and roan bulls, 10 to 18 months of age, from superior milking dams. Write me for prices and particulars before placing your orders elsewhere.

C. C. H. EATON, - - - - CANARD, N. S.

HOLSTEIN BULLS AT BARGAIN PRICES

Two pure-bred, but not registered, Holstein Bulls, 16 and 18 months old, in excellent condition, fit for service. Just right for farmers who have only grade herds and wish to improve. These bulls will be sold at bargain prices, Write quickly if you want one of them.

A. HECTOR CUTTEN, - Inglewood Farm, Lower Truro, N. S.

BUFF ORPINGTONS

I have changed my place of residence from Amherst to Oxford Jct. N. S. and am better prepared than ever, to supply those wishing Buff Orpingtons stock or eggs, the ideal table fowl and winter layers. Our winnings at the Maritime Winter Fair against strong Competion were as follows 1st cock 1st hen 1st cockerel 1st 3rd pullet, 2nd utility Cockerels 1st & 2nd utility pullets and 1st pen.

Our breeding pens are mated as follows

PEN NO. 1 Headed by "General Joffer" 1st cockerel at Halifax, F'ton, and Amherst mated with the 1st pen at the same shows, with 5 others of equal merit. Eggs $3.00 per 15

PEN NO. 2 Headed by "Kitchener" 1st Cock at Halifax, F'ton, and Amherst mated to the 1st 2nd Pullets with six others just as good. Eggs $2.00 per 15.

PEN NO. 3 Headed by "Prince" never shown, but an exceptionly fine utility bird good eve, color right through with lots of size mated with the 1st & 2nd pairs of utility pullets at Amherst 1915 with others that will produce stock that will fill your egg basket next winter Eggs $1.50 per 15

All infertle eggs replaced free of charge

R. R. BLACK, "Elmhurst Farm,"
Oxford Junct., N.S.

WEDDING STATIONARY.

We furnish correct invitations and announcements, with double envelopes.

Price: 50 for ..... $ 2.50
100 for 3.50

We prepay charges.

Engraved Invitations, $11.00 per hundred.

Engraved Cards, $1.00 per hundred. Plate, $1.00.

One hundred Calling Cards, Printed, 65 cents.

Lack of Potash in Commercial Fertilizers

By B. Leslie Emslie, C.D.A., F.C.S., Supervisor Investigational Work With Fertilizers Ottawa Experimental Farm.

W are today confronted with the problem of devising means to overcome the difficulties presented in the prevailing scarcity of potash. Our chief and almost exclusive commercial source of this fertilizer, as a result of the war, has been entirely cut off. The very small stocks of Muriate of Potash now found on the American continent find a ready sale at $450.00 per ton, which represents an advance of 1000 per cent in the price of this material. Needless to say, such a price prohibits the agricultural use of potash in this form. The war is responsible also for an increase of from 30 to 40 per cent in the price of Nitrate of Soda and Acid Phosphate, chiefly through the greater present demand for Nitrate of Soda and Sulphuric Acid (which is necessary to the preparation of Acid Phosphate) in Munition manufacture. Of the ten or twelve essential elements of plant food in the soil, but three tend to become seriously depleted by cropping. These are nitrogen, phosphoric acid and potash, the valuable constituents of commercial fertilizers. Each elecement has its own peculiar role to play in plant nourishment, and in its special functions, cannot be replaced by another. Potash is essential to the formation of carbo-hydrates represented by the starches, sugar and fibrous matter of plants, hence it is important in the production of the potato tuber, the dry matter of which consists almost entirely of starch. No farm crop is more dependent on an available potash supply than the potato; consequently it is the potato growers who most seriously feels the present lack of potash. In place of the popular potato fertilizers, containing 2-8-10 or 4-8-10 of nitrogen, phosphoric acid and potash respectively, the farmer is now offered a brand represented by the formula 4-10-0, and naturally revolts at the inferior substitute.

Domestic Sources of Potash. Barnyard Manure.

Our chief domestic source of potash is barnyard manure, the composition of which depends on the kind, age, function and food of the animal producing it, the quantity and nature of the litter employed and, last but not least, the care taken in its production and preservation. The result of a number of analyses of mixed fresh horse and cow manure from animals well fed and supplied with sufficient bedding to hold all the liquid excreta, shows an average of 10 pounds of nitrogen, 5 pounds of phosphoric acid and 10 pounds of potash per ton. Notwithstanding the exercise of the greatest care, it is impossible to avoid some losses from manure through fermentation and leaching. To prevent undue fermentation and consequent serious loss of nitrogen in the form of gasses, the manure heap must be kept compact and reasonably moist. Loss by leaching of the liquid manure may be reduced to a minimum by the use of proper absorbents and by protecting the manure heap from the action of heavy rains. Under general conditions the hauling out and spreading of the manure on the land as soon as possible after it is made, is unquestionably the best means of insuring undue loss of its fertilizing constituents. When we consider that more than 1-2 of the nitrogen and at least 3-4 of the potash of cow manure (comprising the largest proportion of farm manure) is present in the urine the necessity of conserving the liquid portion is very obvious. Furthermore, as these constituents are present in solution (and therefore almost immediately available) in the liquid manure, they are more valuable, pound for pound, than those in the solid portion.

Functions of Manure in the Soil.

The beneficial influence of manure is by no means confined to its chemical action in furnishing plant food to the growing crop, indeed its physical and biological effects are often of greater importance. The physical influence of manure is exerted through its humus forming function, whereby a light sandy soil is bound together and its water retaining power increased, and a heavy clay soil made more open and porous, thus permitting the freer circulation of air and moisture. Manure acts biologically alone in supplying humus as a medium for the favourable development and activities of the valuable soil bacteria, but in itself furnishes supplies of these organisms.

The Importance of Humus.

No soil can be highly productive unless adequately supplied with humus, which in addition to its other properties, represents the soil's nature storehouse of nitrogen, the most expensive element in commercial fertilizer. Where sufficient manure is not available for the maintenance of humus, recourse should be had to the practise of green manuring,—i.e. the growing and ploughing under of a crop of clover, vetch, buckwheat or rye, etc.

Wood Ashes

Good unleached wood ashes may contain from 5 to 6 per cent of potash, about 2 per cent of phosphoric acid and from 20 to 30 per cent of lime. Unfortunately, their alkalinity renders them unsuitable as a fertilizer for potatoes, since lime tends to encourage the development of potato scab. Their use, however, on soil believed to be free of the potato scab fungus, might be advised. In any case, wood ashes may be expected to increase the yield, the quality only being subject to depression.

Sea Weed.

To those living near the Seaboard supplies of kelp, rock weed and eel grass may be available. In composition, these usually compare favorably with barnyard manure, and represent a valuable material, of which full advantage should be taken. We have conducted some experiments in the drying and grinding of Sea Weed, the object being to discover whether the reduction of bulk and weight of the material by such a process would permit its profitable employment as a nitro-potassic fertilizer in districts remote from the coast. To ascertain its fertilizing value, a large number of experiments with potatoes are being introduced in the eastern provinces, this year, and until the results of these are available, no definite opinion on the merits of the ground sea weed can be stated.

Residue From the Manufacture of Beet Sugar.

The sugar beet contains on an average about 0.5 per cent of potash which is largely present in the resulting molasses. Some potash for fertilizer purposes is available from this source, but naturally, the quantity is insufficient to supply more than a very small fraction of the local demand.

Feldspar.

Numerous processes for the extraction of potash from Feldspar have been pateuted, but none has yet proved an economical success. Application of raw ground Feldspar to the soil have been made experimentally, but the results obtained were largely negative and in no case has any appreciable increase in yield been attributed to the ues of the material.

Alunite.

This is a hydrated sulphate of potash and Alumina, usually found in trachyte rocks. Hitherto, deposits of this material have been exploited as a source of Alum. In the United States considerable attention has recently been directed to occurrences of this Alunite at Marysville, Utah. These are now being worked successfully for the production of potash. The quantity produced from this source, however, cannot be expected to make any appreciable impression on the market price of potash, the demand of other industries leaving no surplus for agriculture.

Potash in the Soil.

In the clay and clay loam soils, derived from the gneiss and granitic rocks of the carbonireous and Silurian geological formations (prominent in New Brunswick), potash of felspatic origin is present in notable amounts. Clay soils generally are rich in potash, while sandy soils are naturally deficient therein. It is the proportion available rather than the total quantity of potash, or other plant food in the soil, which determines its crop producing power, at least in so far as the food supply is the limiting factor. The quantities of plant food supplied in an ordinary application of fertilizer are infinitesimal in comparison with the total amount of these already in the soil. Indeed, so small is the proportion added in this way that it might escape detection in a chemical soil analyses and yet effect a weighty increase of crop. It is to the fact that fertilizers augment the soil's supply of readily available plant food that their beneficial influence is due.

Availability of Soil Potash to Growing Crops.

Through the operation of natural agencies in the soil, aided by cultivation and drainage, plant food from the soil's original stock is gradually released in forms assimilable by the growing crop.

The power to assimilate a certain plant food varies according to the nature of the crop. For instance, turnips demand chiefly a liberal supply of available phosporic acid, and seldom require potash in the fertilizer, if furnished with a medium application of barnyard manure, notwithstanding the fact that a 700 bushel crop of turnips (roots) removes nearly three times as much potash as a 200 bushel crop of potatoes (tubers). A readily available, ample supply of potash is essential to the successful production of a potato crop.

Lberators of Soil Potash.

We are now led to enquire how we may facilitate the liberation of soil potash for the needs of the potato crop.

Lime and Lime Compounds

You have been told of the nature and functions of limestone and marl (carbonate of lime), burnt lime and slaked lime, all of which possess alkaline properties and are useful for the correction of soil acidity.

Burnt and slaked lime are exceedingly caustic in their action and rapidly decompose humus. For this reason their use should be restricted to soils rich in humus and to the heavier types of clay and clay loam soils. In addition to this effect, they exert an influence in the liberation of potash from insoluble soil compounds. However, owing to their strong alkaline properties, these materials should not be applied in preparation for a potato crop, which prefers a slightly acid to an alkaline soil.

Lime Requirements of Soils.

Apropos of the soil acidity question, some chemists claim that a soil which contains less than 0.5 per cent of lime is in need of lime. Such a statement requires qualification, as the charac-

(Continued on Page 417.)

Lime and Soil Productiveness

Liming of soils is a very old practice. It may be gathered from the writing of Pliny, the Roman, that progressive Roman farmers practiced marling or lining more than two thousand years ago. It was a common practice in England more than two hundred and fifty years ago. In the epoch making letters of Agricola published in Nova Scotia in 1818, the practice generally grew into disfavor owing to the fact that it was over done, and no doubt also owing to the fact that the underlying principles were not thoroughly understood. Only in exceptional cases is lime of value as a direct plant food. In general its effect is to create favorable conditions for the setting free of plant food already existing in the soil Hence, if means are not taken to keep up the supply of plant food, lime will ultimately deplete a soil of its store of plant food.

"Lime and lime without manure
Makes both farm and farmer poorer."

During the present century a wide spread movement for the use of lime in agriculture has grown up, and at the present time the judicious use of lime is being advocated by the leading agriculturists in nearly every state of the Union, in Eastern Canada and in parts of Europe also. However the underlying principles are now understood, and limnig is being recommended only in so far as it is associated with the increase of humus in the soil. The crops which are most benefitted by lime are the clovers, and modern practice has shown that where lime is used as a means of increasing clover production, it will not only stimulate the soil to which it is applied to give up its plant food but will actually lead to an increase in the amount of humus and nitrogen in the soil.

What Form of Lime?

A twenty years tests at the Pennsylvania Experiment Station where lime was used at the rate of two tons per acre of burnt lime every four years, or two tons of ground lime stone every two years, not only resulted in bigger crops but the plots to which lime stone was applied were at the conclusion of the experiment 375 lbs per acre richer in nitrogen, and contained 4.7 tons more humus than those to which burnt lime was applied. The lime stone produced all the results of the burnt lime, but was milder in its action and did not use up the organic matter as did the burnt lime. Many similar experiments might be quoted to show the superiority of ground lime stone over burnt lime.

In line with the results of this last described experiment modern lime users are strongly recommending ground lime stone instead of burnt lime. The advantages in its favor are as follows:

1. It is milder in its action and not, therefore, likely to cause any injury. In other words, it is "Fool proof."

2. It can generally be produced cheaper.

3. It is much easier applied.

Lime stone consists of lime plus carbonic acid. When it is burnt, the carbonic acid is given off and the lime left behind. One hundred pounds of limestone when burnt will yield fifty-six pounds of lime. Hence, in order to apply an equal quantity of active lime to the soil, one has to use practically two tons of limestone in comparison with one ton of burnt lime.

The geological formations of New Brunswick are practically the same as those of Nova Scotia, and the soils probably contain about the same amount of plant food and no doubt have the same chemical reaction. During the past three years, some hundreds of determinations of Nova Scotia soil have been made at the College at Truro, and the significant fact has been determined that about 95 per cent of Nova Scotia soils are more or less acid, which condition is not favorable to the optimistic growth of most crops. A further significant fact is that the average amount of lime found in soils from different parts of the Province was .25 per cent, whereas the average amount found in a good arable soil should be at least .3 per cent, and the average of two hundred very fertile United States soils contained 2.16 per cent of lime. Now, lime exists in the soil in several combinations, being united with carbonic acid. phosphoric acid, sulphuric acid, silicic acid as well as in combination with organic acids. The only one of these combinations which will help to correct acidity of the soil is the carbonate. Hence, the mere statement that a soil contains so much lime is not sufficient in itself to indicate the need of adding lime to it. But, when a soil is found to be below the average in lime content and to also be acid, experience has shown that the application of lime is likely to be attended with good results, and since this is the case with most Maritime Province soils, one is lead to expect that theoretically at least lime should give excellent results. What are the facts?

On the College Farm at Truro, the soil of which is derived mainly from red sandstone, three plots of oats and three plots of wheat were treated with ground limestone by Prof. Trueman in the Spring of 1914 at the rate of four tons per acre. Otherwise, this land was fertilized and cultivated in the usual manner. Corresponding plots were left without the limestone treatment.

No material difference was noticed in the yields of grain on the lime and unlimed plots. As soon as the grain was cut, however, the clover on the limed portions of most of the plots was found to be considerably ahead of that where no lime had been used This difference became increasingly noticeable right up to the time of the cutting of the clover in July, 1915. The figures presented in the following table show the actual amount of hay cut on the respective plots:

In studying this table it is worth noting that these were large plots, being either one-half acre or one acre in extent.

No. of Plot.	Size.		Amount of Cured Hay.	Yield Per Acre.
1	1 acre	½ unlimed	2550	2.5tons
		½ limed	3610	3.6 „
2	1 acre	½ unlimed	2570	2.5 „
		½ limed	3090	3.2 „
3	½ acre	½ unlimed	1160	2.3 „
		½ limed	1490	3.0 „
4	½ acre	½ unlimed	1150	2.3 „
		½ limed	2010	4.0 „
5	½ acre	½ unlimed	3650	3.6 „
		½ limed	3650	3.6 „
6	½ acre	½ unlimed	3050	3.1 „
		½ limed	3050	3.1 „

It will be seen that the gain from the use of limestone was not uniform. On Plot 1, the increase was a little over one ton per acre, while on plot 2 it was only a little over half a ton. On plot 3 the difference was 1320 lbs., while on plot 4 it was nearly one and three-quarter tons. On plots five and six the yields were practically on the limed and unlimed areas. The only explanation we can offer for the lack of results on the last two plots is that the soil was in extra good condition and the clover grew well even without the use of lime.

The total yield in favor of lime on the first four plots amounted to 1.4 tons and there was one and a half acres limed vs. one and one-half acres unlimed. That is a gain of .93 tons, which at $10.00 per ton would be worth $9.30.

In order to get his result four tons of limestone were applied so that the returns per ton of limestone in the first crop of clover hay was $2.32. There was nearly a corresponding difference in the second crop of clover, which was cut green for feeding purposes, there being eight-tenths of a ton more clover on the limed than on the unlimed plots. This makes the total extra return in the two cuttings for the year 1.7 tons, worth approximately $17.00, so that in this particular experiment we got back practically $4.00 for every ton of ground limestone applied. It must not, however, be forgotten that we got no returns worth speaking of from the lime applied to plots 5 and 6. Furthermore, smaller experiments carried on to determine the gain from the application of limestone to poor soils, resulted in very small yields indeed. The inference is that on a whole area to which limestone might be applied, the returns will vary greatly, but assuming that the soil is in moderately good condition and that the results from Truro are reasonably typical, one should expect about $2.00 extra clover crop for each ton of ground limestone applied up to four tons per acre, but do not forget one had to wait two years for even this return.

The limestone should continue to give results due to the extra heavy sod which will be ploughed under in the limed area as compared with the unlimed area and also due to its own beneficial effect on succeeding crops. Hence, one should reasonably look for at least double the above return at the end of five years which is about the length of time that a four ton application will continue to give noticeable results.

It is valuable in this connection to record the results which have been obtained at other experiment stations. In bulletin 400, published by the New York Agricultural Experiment Station. it is stated that, in Ohio, in twelve years of testing on many plants, moderate applications of limestone once in a crop rotation of five years on soils only moderately acid, have given average net profits of $15.00 an acre when used alone and from $2.00 to $5.00 more than this when used with phosphorous, with barnyard manure.

In the same bulletin it is stated that in New Jersey the value of the increase in general farm crops on five years after a two-ton application of ground limestone was placed at $ 5.00 per acre and the value of the increase in vegetables at $48.00 per acre. Other records of this kind will be found in an article on "Lime in Relation to

(Continued on Page 435.)

Teaching Children to Become Strong, Resourceful Citizens.

The following circular has been sent out to many teachers of our schools in the hope that they have caught the spirit of the hour and see their opportunity to influence for New Brunswick's advantage the lives of those under their care.

We wish our children, while they are still susceptible to favorable impressions to become acquainted with the magnificent natural resources that lie about them. We wish them to build their patriotism on the solid foundation of the province's power to yield them a prosperous and enjoyable living in return for intelligent industry.

In this period of the nation's need the children of New Brunswick, instead of standing idly by, can well take a hand and do their part. Thus they will strengthen their loyalty and deepen their patriotic attachment to home and country and at the same time gain a practical power which is the result of true education.

What New Brunswick may have to offer settlers after the war, what to her own sons and daughters to induce them to remain here and as progressive and patriotic citizens, help develop her resources and extend her influence depends in a great measure on what the schools are doing. The citizen of to-morrow is the product of the school of to-day.

If he is to be self-reliant, progressive, efficient he must acquire this power, not through mental effort alone but through the exercise of his entire being in relation to his environment.

Patriotic striving children become strong and resourceful citizens.

Sussex, N.B., Mar. 25, 1916.

Circular Letter.

To the School Garden Teachers of New Brunswick and other teachers interested,—

I beg to call your attention to the fact that this is a special year in our history. The war is causing us to lose many of our citizens who are agricultural or industrial producers. They have gone to fight for us. Thus the ranks of workers at home are being depleted and there is need that a special effort should be made not to permit a shortage in production.

There are more than 60,000 children in attendance in our public schools. Is it not fair for us to think that many of these children can do something to decrease the loss in production that is being caused by the absence of producers who are at the front? If every capable child would undertake to cultivate even a small plot at home, on a vacant lot, in backyard area or garden at school, while the quantity raised in any one case might be small, the aggregate would be large and of considerable value, and would help many families who might otherwise be in need.

Will not you as a teacher appeal to your pupils to engage in this work? They have been acquiring some knowledge of Nature Study and Elementary Agriculture. Many have been taking part in School Gardening. Here is an opportunity for them to put their knowledge and training to good account applying it for this patriotic purpose.

This Department will co-operate with teachers and pupils supplying them with a considerable quantity of seeds.

We believe that in every town as well as in country districts children will find much pleasure and profit in engaging in this effort. It has its educational value. It will eanble them to be a real factor in the present great struggle.

In addition to supplying seeds, our Department is also offering prizes for work done in districts where next fall there are school fairs.

The children should be taught how to prepare the land, to plant the seed and to cultivate so as to secure the best crop possible. Will you co-operate with us? Let it be known that the school children of New Brunswick are doers not merely dependents.

Applications for seeds should be sent in as soon as possible. Wheat, Oats, Barley, Buckwheat, Turnip, Carrot, Mangel and Potatoes are the principal seeds that can be supplied.

R. P. STEEVES,
Director Elem. Agri. Education.

N. B. Potato Growers Convention

T. W. CALDWELL
Pres. N. B. Potato Crowers' Association

Potato growing is one of the most important industries in the counties of Carleton, Victoria, and in portions of some of the other New Brunswick counties. It is the cash crop on whch a great many farmers speciali e. To these farmers a bumper crop and fair markets mean a whole lot. If the crop is good and the market it normal, bills are promptly paid and additional labor saving machines, and home necessities and luxuries can be bought. If the crop is a poor one, there is a possibility that scarcely enough cash will be realized to pay the heavy fertilizer bills. Other bills increase in amount instead of being diminished and the general cry is that everybody is confronted with hard times. Not only the farmers but the merchants, the tradesmen and all lines of business or organization feel the adverse effects.

The soil may have been prepared, fertilized and cultivated, good seed may have been planted, the season for growth may have been ideal, yet why is it that when the harvesting season arrives it is found that the yield is not perhaps one-third of the yield per acre realized by many other farmers in the same locality, who are working under the same conditions of soil and climate.

The cruix of the matter isthis:

One farmer has attended to every detail of crop production. He has made a study of his business either by reading, by listening to and heeding the advice of farmers who know, or by his own personal observation. His soil is well prepared, fertilized and cultivated. Due attention is paid to rotation of crops. The seed used is carefully selected and treated for scab before it is planted. As soon as growth appears weeds are kept down, the soil is kept well stirred to conserve the moisture. Disease plants are rogued from the field, and from the time the plants are a few inches high until they are ready to harvest they are frequently sprayed to prveent disease and keep insect pests in check. Treatment of this kind is a sure insurance and is bound to give maximum crops.

On the other hand the farmer who may or may not attend properly to preparation, fertilization, cultivation and seed will not get maximum yields if he fails to neglect the treatment of seed, the elimination of diseased plants and the keeping in check of fungus and insect pests.

Plant diseases are playing havoc with potato growing in New Brunswick as well as in Nova Scotia and Prince Edward Island.

The Federal Department of Agriculture has established a laboratory at Fredericton under the charge of Porf. G. C. Cunningham, Plant Pathologist, who has done considerable research work on plant diseases and whose duty and pleasure it will be to assist the farmers of New Brunswick in the control of plant diseases.

Soon after coming to the Province Prof. Cunningham realized the magnitude and importance of the potato growing industry in New Brunswick. He also realized that the growers were working very independently of each other—a lack of united efforts—consequently he decided that the best way to get united efforts for quality products and record production was to get the growers organized so that efforts might be united for the dissemination of knowledge re the various problems confronting the individual grower.

With this aim in view he called a meeting of interested growers to meet in Woodstock, N.B., on the 22nd and 23rd of March.

A convention of New Brunswick potato growers was held on March 22nd and 23rd at the Fisher Vocational School, Woodstock, which was attended by over 280 representative growers and delegates from the Agricultural Societies of the Province.

The morning of the 22nd was spent by those present, in the Exhibition Hall, were the Dominion Experimental Farms Agricultural Exhibition Exhibit was displayed, together with 60 varieties of potatoes which were grown and tested at the Experimental Station, Fredericton.

At 2 p.m. a meeting was held in the Lecture Hall, Mr. Wilmot Hay of Woodstock in the chair. The chairman called on Mr. G. C Cunningham, Dominion Plant Pathologist for New Brunswick, for an address. Mr. Cunningham addressed the meeting on "The object of the convention and the possibilities of forming a Potato Growers' Association," and in the course of an able talk, gave some interesting figures on potato production in the principle potato growing countries of the world. He also showed that a much larger crop per acre could be produced in New Brunswick by the employment of better methods of cultivation, seed selection and disease control, and to this end he advocated the formation of a Potato Growers' Association. Mr. Stuart Fiske spoke in favour of such a movement and moved that steps be at once taken to form an Association. Mr. J. E. Porter seconded the motion, and on being put to the meeting, it was carried unanimously. Mr. Porter asked that Mr. Cunningham give some particulars as to the manner of forming such an Association. Mr. Cunningham said that the first thing would be the nomination of a Constitution committee, and asked that Professor William Stuart, Horticulturist in charge of potato investigations, of Washington, D. C,. for some remarks on his knowledge of community work. Professor Stuart gave an interesting account of the methods employed in Wisconsin. Mr. W. T. Macoun, Dominion Horticulturist, also spoke and pointed out that British Columbia and the other Western Provinces were now in a position to compete strongly in the potato market and that it was necessary for New Brunswick to do everything to continue to uphold her reputation for good stock and to be first on the market He therefore strongly favoured the formation of an Association. The following men were then nominated by the chairman to act on the constitution committee: W. W. Hubbard, C. M. Shaw, W. E. Palmer, W. Moore, J. E. Porter and G. C. Cunningham.

The next item on the programme was an address by Professor W. S. Blair, Superintendent Dominion Experimental Station, Kentville N.S., on "Potato Improvement and Seed Selection."

At the conclusion of Professor Blair's address, Professor Stuart and Mr. Macoun joined with him in leading an interesting discussion on several question which came before the meeting, relative to the culture of potatoes.

The next item was an address by Mr. W. W. Hubbard, Superintendent Dominion Experimental Station, Fredericton, on "Varieties of potatoes suitable for New Brunswick conditions."

At the conclusion of Mr. Hubbard's address, the report of the Constitution Committee was handed in, with a copy of the proposed constitution and byelaws. It was moved by Mr. W. W. Hubbard, secended by Mr. W. H. Moore, that the report of the Constitution Committee be received and adopted. This resolution was carried unanimously. It was then moved by Mr. C. M. Shaw, seconded by Mr. J. Bremner and carried unanimously, that the thanks of the convention be tendered to the speakers. The Convention adjourned at 5.20 p.m.m

The second session was opened at 7.30 p.m., Mr. A. D. Holyoke of Woodstock, in the chair. At the outset, the chairman announced that owing to pressure of Parliamentary duties, the Honorable J. A. Murray, Minister of Agriculture, was unable to be present, but was represented by the Secretary of Agriculture, Mr. J. B. Daggett. Mr. Daggett expressed to the Convention the regret of the Minister at being unable to be present as follows:

Mr. Chairman, Ladies and Gentlemen:

I hardly think it would be unwise for me take up the time of this meeting in discussing the subject "Agriculture in New Brunswick" upon which the Minister had hoped to speak to you tonight, as I have spoken so many times and in so many places on this same subject. I would, however, express the regret of the Minister at not being able to be here to-night. He regrets his absence the more on account of the fact that on an occasion last summer when he was to have been with you, he was unable at the last moment to be present. As you know, on account of the illness of the Premier, Mr. Murray is filling the position of Acting Premier, and he found it quite impossible to be away from Fredericton just at this time. I would also like to say that I have many times expressed faith in the possibilities of New Brunswick compared with other provinces and the United States. New Brunswick now stands and will, I firmly believe, continue to stand in a foremost place in the agricultural world. We have disadvantages, but then again we have distinct advantages, and there is on every hand, decided evidence of a forward movement which has come to stay and which will increase in volume and power, in the interests of agriculture. At one time, agriculture was looked upon in this province as meerly a side line to the lumbering industry. These days are past and the conditions of 20 or 25 years ago have undergone a great change. Agriculture is now recognized as being no mean proposition and in every community we find intelligent men conducting their farms along scientific lines and showing themselves anxious for knowledge of still further improved methods of agriculture, which goes to show what a wonderful improvement has been made. We held the annual meeting of the New Brunswick farmers' and Dairymne's Association at Fredericton a few weeks ago, at which Mr. Barr, of the Dairy Division at Ottawa and Dr. Moore of the United States Department of Agriculture, were present. Both these gentlement have since expressed to me their pleasure at having been present to hear the intelligent discussions on the different subjects which were taken part in by the farmers present. From these indications, I believe that we are moving [illegible] ward. Again expressing the regret of the Minister at being unable to be present, I may add that he is doing everything possible in the interest of the farmers in this province and that so long as he holds the position, agriculture in New Brunswick will be allowed to hold no second place.

The next item was an adrress by Mr. W. T. Macoun, Dominion Horticulturist, on "The Potato and its culture." Mr. Macoun has had 28 years experience in experimental work at the Central Experimental Farm, Ottawa, during which period he has experimented with over 800 different varieties of potatoes. Many questions were asked the speaker at the conclusion of his address, and in this way many new ideas were gained by those present.

The financial side of the potato industry was then taken up by Mr. E. W. Jarvis, Manager of the Bank of Montreal, Woodstock, who gave an able address on "Potatoes and community finances." The branch of the Bank of Montreal, of which Mr. Jarvis is in charge, being situated in the midst of one of the most important potato growing sections, he is well qualified to know what standing the industry holds in the financial world.

A vote of thanks was tendered the speakers and the Convention adjourned at 9.45 p.m.

The Convention assembled for its third session at 9.00 a.m. March 23rd, Mr. J. E. Porter, of Andover, in the chair. The first business was the appointment of a nominating committee to nominate officers for the proposed Potato Growers' Association. The following were appointed as a nominating committee: Mr. W. W. Hubbard, Mr. C. N. Shaw, Mr. J. E. Porter, Mr. J. Bremner and Mr. T. W. Caldwell.

An address was then given by Mr. G. C. Cunningham on "Potato Diseases and their control." Mr. Cunningham, in the course of an interesting address, exhibited specimens of the different diseases which are most troublesome in our potato fields and cellars, and showed that with a more careful methods many of these diseases may be eliminated. He also showed that, basing his information on a survey made last season by himself and his assistants of the potato fields in many sections of the Province, the total losses due to disease, of the possible total crop were as follows: Blak-leg, 7% loss or 840,000 bushels, Rhizoctonia, 5% loss or 600,000 bushels, Mosaic disease, 10% loss of 1,200,000 bushels, Late Blight, 25% loss of 3,000,000 bushels, a total of 47% loss, or 5,640,000 bushels.

Mr. W. W. Hubbard next addressed the Convention on "Potato Growing and the Maintenance of Soil Fertility." This was a very timely and helpful address in view of present conditions, and was very ably handled by the speaker.

Mr. Hubbard was followed by Mr Guy G. Porter of Perth, with an address on "The Growing, Handling and Marketing of the Potato Crop." Mr. Porter is a member of the firm of Porter, Manzer, Ltd., one of the largest potato shipping concerns in the Province, and from the standpoint of his own experience with the grower and the buyers in the different markets, gave the Convention some very interesting ideas on the potato industry from seed to consumer.

The fourth session was opened at

THE MARITIME FARMER.

And Co-operative Dairyman
Registered Trade Mark

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said :—"I saw" your adv. in the MARITIME FARMER.

RATES FOR CASUAL ADVERTISEMENTS.

1 inch—First insertion 75 cents 2 inches—First insertion $1.50; inches—First insertion $2.25.

Contract rates on application.

Address letters and make all checks, money orders, postal notes, etc., payable to

THE MARITIME FARMER, or
R. D. Robinson Publishing Co., Limited
Sussex, N. B.

Toronto Representative—J. Lester Davis, Miln Building 8 Johnson Street.

Montreal Representative—Dakers Cameron, St. Nicholas Building.

NOTICE TO ADVERTISERS.—Changes of ads. should reach this office one week before date of issue, in order to insure insertion.

RECEIPTS FOR FARMER SUBSCRIPTIONS

The Maritime Farmer, instead of giving you one receipt in the year for a paid subscription, sends you 24, or one every two weeks. You will find it on the GREEN COLORED LABEL on which your address appears. The date printed thereon is that on which your subscription terminates. If on payment of your subscription the date is not changed within two weeks, please notify us. No other receipt will be sent.

APRIL 4, 1916.

DATES OF ISSUE.

April	4-18
May	2-16
June	6-20

FIGHTING GRAIN SMUT.

We are now nearning the seeding season. Ere long the seed grain will be committed to the soil, there to sprout and grow and bear its kind. Shall the increase be ten, twenty, fifty or a hundred fold? We confidently look for a high yield, and providing climatic conditions are favorable a high yield we will receive if we do our part. Good, plump seed of high vitality is a big factor in getting the desired result. It makes no difference how much time we spend on the preparation of the soil or how fertile we may make it unless the seed we use is good we need not look for high class results. We have repeatedly referred to the value of good seed in the columns of the Maritime Farmer during the last year, and we have no doubt not a few of our farmers have put forth special efforts to grade the best portions of their grain for seed purposes.

Well, suppose the soil is fertile and well prepared and the seed grain well graded, the next precaution to take is to guard the seed against an infestation of smut. The spores of this parasatic plant live over winter on the seed grain, and when growth begins in the field these spores also begin to grow, and ere harvest time comes a lot of damage is caused.

Have you ever inspected your grain fields and noted the large munster of smutty, brownish black heads of grain. If you figure it up you will find like other farmers have found that smut takes a big toll off your labors. It is an enemy that you can and must combat if you would glean the best results. You may say: How can I combat the smut pest?

Treat you grain before you commit it to the soil as follows:—

Treating seed grain with formalin will positively prevent stinking smut of wheat, oats smut and covered smut of barley. Treatment with hot water is necessary to destroy the spores of loose smuts of wheat and barley, but this must be handled very carefully. The formalin treatment for the ordinary smuts, however, is cheap, easily applied and effective.

Formalin is purchased at drug stores at 50 cents to $1 per pint. It is a 40 per cent soultion of formaldehyde gas in water. Be sure that your druggist guarantees the strength. One pint will treat from 25 to 50 bushels grain.

Mix formalin with water at the rate of a pint to 40 gallons. Do not open the bottle until you are ready to use the solution. Spread the grain out on a clean floor or a canvass and sprinkle the solution over it with a common sprinkling can or other convenient means.

Shovel the grain over and over, adding solution as need until you are certain that every part of every kernel has been thoroughly moistened. Then shovel the grain into a heap and cover with sacks or canvas for an hour or so. This allows the formaldehyde, which is the active agent that destroys smut spores, to permeate thoroughly the whole mass and do its work.

Next spread the grain out and dry it so it will work well in a seeder. It is well to use the formalin solution to disinfect seeder, grain bags and other possible sources of smut infection.

Seed grain should first be put through a fanning mill so as to blow out all smut balls and loose smut, because frequently the solution will not soak through these masses of spores. If the grain is sown immediately after treatment, more should be used to the acre to allow for the swelling of the moistened grain.

SCREEN THE HOUSE.

Any man handy with tools can easily make the screens for the windows or doors that will serve the purpose of keeping out flies and mosquitoes. Of course, the proper thing to do is to keep the premises in such condition that mosquitoes and flies will not breed. But this is an ideal condition that is almost impossible to bring about entirely, especially on the farm. No man is doing himself and family justice when he refuses to spend the small amount of money necessary to buy screens for the doors and windows. Give this matter careful thought right now. It will certainly give you much comfort, and it is possible that it may save the life of some member of the family.

The rural mail carrier and the telephone have been the most potent agencies in revolutionizing farm life. They bring quick communication between the city and the farm home. They have banished the isolation and loneliness which were formerly the bane of country living and have brought to the farmer and his family the daily intelligence of both local and world affairs. The rural mail carrier often has a hard job in threading snow-covered or mud-covered roads, but he carrier with him untold happiness and sunshine to many a heart and home.

* * *

Scarce and high are all forms of plant food, owing to war conditions. Save and utilize all manure, ashes, leaves, compost, muck; order fertilizer before it goes still higher. Plough deeply, harrow well, cultivate thoroughly so crops can feed on what is already in the soil or that you put on it.

Som people seem to forget that their neighbors may be good people.

* * *

The good dairy farmer is never out of a job and that's a thing that thousands of people in the city would be mightly glad to boast of.

* * *

It was a philosopher that said: "A fool learns from no one; a wise man learns from everyone—even from a fool."

* * *

When a man has not a good reason for doing a thing, he has one good reason for letting it alone.

* * *

Good stock will put more profit into one's pocket than poor stock. Keep this constantly in mind, and make a determined effort towards improving the quality.

* * *

The farmer who breeds his mares this season is pretty nearly certain to be on the right track. The war is almost certain to have a decided effect in the way of reducing the world's horse population.

* * *

Dairying is more thoroughly studied today than ever before. It is being made a practical science by thousands of progressive farmers the country over.

* * *

Science is knowing, art is doing. Scientific farming is know-how farming. It is farming made easier, surer, more profitable, more attractive, through better knowledge of nature's forces and more co-operation among farm folk.

* * *

There are too many small gullies about over the farm. Brush, trash, rocks, poles and other material thrown into the gullies will aid in eliminating them. Throw some of these into the gullies and plough over them and don't let them form again.

* * *

A good job for a rainy day is cleaning out the poultry house. There is danger of the hens having a more objectionable place to roost in summer than in winter. Lack of ventilation, filth and mites are three things that the hen frequently encounters in summer.

* * *

The great advantages of dairying are that the products are always in demand at good prices, that the product is condensed and removes from the farm a very small quantity of fertility, the product is economical in delivery, and being a perishable product must be sold often, which means that the cash is realized a few days after it is produced. The fact that dairying furnishes a steady income throughout the year, along with the insurance above mentioned, commends it to the best farmers.

* * *

When, oh when, will politicians cease to put politics ahead of progress? Too often our politicians cater to the unprogressive class rather than to the wishes of those who are trying to build up our country. We have heard some politicians say that they would not touch the question of imposing a tax on dogs as a protection to the sheep industry lest they lose a few votes by so doing. It is not a decision in favor of the most good to the country. In the politician's mind it resolves itself to the thought: "Will I lose my position?"

A few no-good dog owners say that he will, the tax is avoided and a law is enacted while excellent in some points is almost as absurd in other points and consequently the profitable sheep business must suffer. "Are slave owners the best lawgivers on slavery?" was the pertinent remark once made by a noted statesman. The sheep business has for many years been the slave of dog owners and it has suffered under their lash. Are dog owners the best lawgivers on the sheep protection question?

Lack of Potash in Commercial Fertilizers.

(Continued from Page 413.)

ter of the soil is a factor in determining its lime requirements. For instance, a light sandy soil may contain much less lime than a heavy clay and yet the clay soil may be in greater need of liming. Furthermore, the form in which lime is present in the soil will determine the amount available for the correction of acidity.

Land Plaster or Gypsum as a Liberator of Potash.

Land Plaster is a sulphate of lime (i.e., lime combined with sulphuric acid). Unlike the aforementioned alkaline lime compounds, it is a neutral salt and therefore of no value for the correction of acidity. In fact, its use tends to increase acidity, sulphuric acid being the residue when lime is removed from the compound.

Land plaster, however, is distinctly efficacious in liberating soil potash, and, although also supposed to encourage potato scab, its use in small quantities, say 500 pounds per acre, may be recommended for the heavier types of soil. Larger applications are not usually advisable, since 400 parts of water are required to dissolve one part of gypsum.

Perhaps the greatest beneficial effect has been observed on clover, hence its application to clover preceding the potato crop might prove a commendable practice.

Undoubtedly the best means of employing gypsum is by sprinkling it on the floor and on the liquid manure in the stable. By combining with the ammonia, it conserves this valuable constituent of manure, its other properties being unimpaired thereby. In order to prove most effective, 75 pounds of gypsum should be used for each ton of manure.

In the manufacture of acid phosphate, the raw phosphate rock is treated with sulphuric acid to render the phosphoric acid soluoble. The lime liberated from the phosphate of lime in this process combines with the sulphuric acid to form gypsum; consequently Acid Phosphate contains nearly 40 per cent of gypsum. Where Acid Phosphate then is the source of phosphoric acid in the potato fertilizer, there may be no necessity for the application of additional gypsum.

Soda Compounds.

It has been noted, as a result of experiments, that where potash is deficient in a soil, there is a tendency for plants growing thereon to assimilate slightly larger amounts of soda than is usual under normal conditions.

However, the occasional benefits derived from the application of sodium salts (other than Nitrate of Soda) are doubtless largely due to the influence of soda in liberating soil potash.

Sodium Cloride. (Common Salt).

It is for this reason that applications of common salt to certain soils have been found to increase the yields of mangels and potatoes and to stiffen the straw of cereals. It is usually applied at the rate of 200 to 300 pounds per acre. A mixture of common salt with gypsum seems useful in retaining moisture in the soil. Either applied individually would be similarly effective.

Sodium Sulphate.

This sodium salt has been recommended as a liberator of soil potash, but as it is the chief occurring salt in the unproductive alkali lands of the west, we should hesitate to advise its extensive use.

Nitrate of Soda.

Nitrate of Soda is the most popular commercial source of nitrogen and may be made to serve the dual purpose of furnishing nitrogen and, indirectly, potash for crop requirements.

Precautions to be Observed.

It must be remembered that these measures for rendering soil potash available are to be regarded as temporary ones, devised to meet the exigencies of the present situation. Their indiscriminate and long continued use would surely lead to soil impoverishment and necessitate heavy potash fertilizing in the years to come.

A Fertilizer for Potatoes.

For reasons already stated, Nitrate of Soda and Acid Phosphate are to be recommended as fertilizers for potatoes.

440 pounds of Nitrate of Soda (15 per cent Nitrogen) and 1250 pounds of Acid Phosphate (16 per cent available phosphoric acid) would be equal to one ton of 4-10-0 goods.

Barnyard manure or green manure should be used in preparation for potatoes. Fertilizers are supplements to, not substitutes for manure.

Conclusion.

Finally, do not except fertilizers to take the place of cultivation and drainage.

Remember that crop production is limited by other factors than the amounts of available plant food in the soil. If it were not so, our crop yields could be increased an infinitum, in direct proportion to the quantity of fertilizers applied, and this we know is an untenable theory.

Prize Winners at the Kings County Seed Fatr

The annual Kings County Seed Fair, conducted under the auspices of the Sussex and Studholm Agricultural Society, was held in the Agricultural School, Sussex, on Saturday, March 18th, was without exception the best seed fair ever held in Sussex. The 1915 fair was a decided success and far outstripped its predecessors. The 1916 fair outclassed the 1915 exhibit very materially.

S. . Moore, Maritime Representative of the Seed Division, judged the grains, and F. L. Fuller, of Truro, Superintendent of Agriculturist Societies for Nova Scotia, placed the awards in the potato classes. Mr. Fuller in the course of his remarks explained to the exhibitors what to look for in the various types of potatoes, and laid particular emphasis on care in selecting exhibits for a seed fair.

Mr. Moore was well pleased with the quality of the grain sections and complimented the directors of the society for their interest in the Fair. He humourously referred to a matter that came to his notice at a Sussex Seed Fair several years ago. He said that in that particular year, although the list of names of the directors and officers occupied one page of the official prize list, only one out of the number had any exhibits at the fair. This year and last the directors were on hand with good exhibits.

At the afternoon session Prof. C. C. Cunningham, Plant Pathologist, delivered an address on the eradication of Club Root on turnips. Every seat in the basement of the Agricultural School was occupied by farmers who had come to hear how that pest may be destroyed, and they went away well satisfied with what they had heard. Prof. Cunningham has found by actual experiment that a proper rotation of crops and a liberal application of lime on infested areas will eleminate the disease. Our next issue will contain a full description of how the work may be carried on.

At the close of the address a vote of thanks was tendered to Prof. Cunningham for his timely address. The first prize samples of seed grain were sold by auction and realized the following prizes:—

White Life Wheat	$2.50	per bus.
Marquis Wheat	3.50	„ „
Six Rowed Barley ...	2.50	„ „
Banner Oats	2.75	„ „
Black Oats	1.25	„ „
Rough Buckwheat	1.75	„ „
Smooth Buckwheat ...	2.25	„ „
Field Peas	3.25	„ „

Following is the list of prize winners:—

Wheat, White or Red Fife.—1. W. E. Wallace, Penobsquis; 2. W. H. Venning, Sussex; 3. W. J. King, Smith's Creek; 4. J. H. Bowser, Rockville.

Wheat, any other variety.—1, W. H. Venning; 2, H. B. Parlee, Sussex; 3, T. A. Davis, Smith's Creek; 4, Leslie Walker, Sr., Millstream.

Barley, any variety.—1, W. H. Venning; 2, Leslie Walker; 3, H. B. Parlee; 4, W. E. McLaughlin, Sr., Millstream.

Oats, white, any variety.—1, H. B. Parlee; 2, A. J. Marr, Newtown; 3, H. S. Secord and Son, Penobsquis; 4, W. E. Wallace, Penobsquis; 5, T. A. Davis; 6, C. T. McIntyre, Sussec Corner; 7, H. McIlroy, Sussex Corner; 8, Leslie Walker.

Black Oats.—1, T. J. Davis, Smith's Creek.

Buckwheat, Rough.—1, H. B. Parlee; 2, W. H. Venning; 3, T. A. Davis; 4, E. Roy Raymond.

Buckwheat, Smooth.—1, H. B. Parlee; 2, T. A. Davis; 3, A. J. Marr

Field Peas.—1, T. A. Davis.

Garden Peas.—1, E. Roy Raymond; 2, A. J. Marr.

Beans, White.—1, H. B. Parlee.

Beans, Colored.—1, H. B. Parlee; 2, C. T. McIntyre; 3, E. Roy Raymond.

Field Corn.—1. H. B. Parlee.

Clover Seed.—1, W. H. Venning; T. A. Davis.

Timothy Seed.—1, W. H. Venning; 2, H. S. Secord and Sons; 3, C. F. McIntyre.

Potatoes, Green Mountain or Delaware.—1, E. Roy Maymond; 2, W. E. Wallace; 3, H. S. Secord and Son; 4, W. F. Mosher.

Potatoes, any long white variety.—1, H. B. Parlee; 2, Hugh McElroy; 3, H. Yeomans, Sussex Corner; 4, H. R McMonagle; 5, A. J. Marr.

Potatoes, any rose variety.—1, A. J. Marr; 2, C. T. McIntyre; 3, H. R. McMonagle; 4, T. J. Davis.

Potatoes, any round, white variety.—1, C. T. McIntyre; 2, H. B. Parlee; 3, T. J. Davis; 4, W. F. Mosher.

Potatoes, any dark skinned variety.—1, H. B. Parlee; 2, W. F. Mosher; 3, T. J. Davis; 4, A. J. Marr.

Turn Waste to Profit.

Recently a proprietor of a large, modern business in a thriving city was heard to remark "my twelve months' trade shows, after allowing myself a low weekly income, not one cent of profit, on all the capital, risk and worry." He distinguishes closely between income and profit for the year.

Does the average dairyman consider his farm business in the same light, each department of its many activities, grain, poultry, lumber, pork, hay, milk? Further does he distinguish between income and profit when dealing with the herd? If (and much depends on that "if") each cow makes a good profit he is indeed well off. Even if each cow is responsible for a good income, things are not too bad. If some of your cows waste good feed because they are not possessed of ability to made milk economically, find it out; turn waste to profit. Make the cows keep you, that is their job; you need profit on the feed, profit to pay for your investment of capital; risk and worry, the same as any merchant. A letter to the Dairy Coommissioner, Ottawa, will bring you free of charge milk record forms, either daily or three days per month, feed records, and a herd record book. When you note down total production and closely estimate cost of feed by occasional weighings, you arrive at individual profit. Make each cow pay a good profit.— C. F. W.

Canadian Seed Growers Association Spring Catalogue.

The annual Spring catalogue of the Canadian Seed Growers' Association containing a list of the offerings of "Registered" and "Improved" Seed by members of the Association, has just been distributed. The catalogue gives the names and addresses of the growers, the kinds of seed and the quantities they are offering, the price per bushel asked, the percentage germination, the certificate number and certain remarks re quality of sample. A description of some of the leading varieties is appended, as is also an outline of the work of the Association and the System which is followed in the production of "Registered Seed."

Farmers desiring to procure high class seed at a reasonable price should write the Secretary of the Association, Canadian Building, Ottawa, Ont., for a copy of the above publication.

HORTICULTURE.

Apple Culture in New Brunswick in 1915 and the Outlook for the Future

By A. G. Turney.

Last year was very unfavorable for apple growing in the province. The spring was decidedly late, cold and wet with but little bright sunshine, and, as a consequence, orchards were from 10 days to two weeks later coming into bloom than usual—orchards generally showing bloom here by May 26th. The bloom was from medium to quite heavy and bore out the indications of the early spring for a good crop. Early varieties, and nearly all winter varieties, gave promise of as large a crop as that of 1915. Fall varieties bloomed somewhat less heavily than the others. The blooming season passed without frost injury but it was marked by decidedly unfavorable weather it being dull, wet and cold. These weather conditions prevailed throughout June, and as a consequence there was only a fair set of fruit and this was followed by a very heavy drop. Thus, early in June it was apparent that the apple crop would be light, and by the end of the month it was evident that it would be one of the smallest in the history of the province. In this respect, however, it is well to note that New Brunswick was no exception, the Monthly Fruit Crop Report for September, issued by the Federal Fruit Division, stating: "Taking the Dominion as a whole, it seems probable that the year 1915 will be long remembered as a year of a low production and poor quality." A few orchards yielded an average crop of really good fruit, but these were exceptional. The large majority of the bearing orchards produced but a light yield and the fruit was decidedly below the average in quality.

Harvesting took place under favorable weather conditions, and prices ruled very high for late fall and winter varieties. Good standard varieties such as McIntosh Red, Fameuse, Golden Russet and Bishop Pippin were in keen demand at prices ranging from $4.00 to $6.00 per barrel for No. 1 stock according to variety.

It should be remembered that such unfavorable weather conditions as prevailed in the spring and early summer of 1915 are more marked in the resulting poor fruit crop in provinces and section where fruit culture is, as yet, for the most part, conducted in a haphazard manner. Adverse weather conditions, favoring as they do the prevalence of fungus diseases, etc., together with the natural tendency of trees left largely to their own resources to bear heavy and light crops in alternate years, are being considerably offset by the application of that optimum combination of work, knowledge, and skill known as "modern orchard practice." Evidences of this are, as yet, only too few in New Brunswisk, but nevertheless they are here, and even this year some growers, through practice for years of modern orchard culture, were rewarded with a good crop of good quality and the highest prices in the history of the industry.

Properly viewed and considered, there is nothing about the fact of the low yield and poor quality of the apple crop of 1915 that should deter us from doing all we can to develop and extend apple culture in New Brunswick. The poor season has but served to emphasize the fact that it is the wide awake and intelligent farmer and fruit grower, the man who does not depend on the weather but who seeks by a proper application of work, knowledge and skill, to aid and offset it—it is he who reaps the advantage and profits of a good yield, good quality and high prices in a year when a general production and quality is below the average.

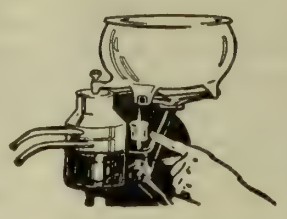
I would like to urge our fruit growers and farmers to plant more apple trees this year. The time was never more opportune and the outlook for profitable returns was never brighter. Maritime provice nurseries have large stocks of first class apple trees of varieties of proved merit for our climate, on hand, and prices are lower than usual. In this connection I would like to remind you that the New Brunswick Fruit Growers' Association, in its purchase of nursery stock for the members, is patronizing the local nurseries and in that way doing what it can to encourage them. Matters have now reached a stage where there is no longer any need or excuse for our people to send their money out of the province when purchasing fruit trees. First class stock of the best varieties of apple trees for this province, New Brunswick grown, may be procured from the Albert Nurseries, Albert, The St. John Valley Nurseries, Burton, Mr. John Jennings, Newburg Junction, and others. Then again, prices for late fall and winter apples were never higher than during the last few months, not only here, but in nearly all the Canadian markets, and the evidence of recent years shows only too clearly the great scarcity of any quantity of really first class late fall and mid-winter grown in the province. More and more every year our people are coming to appreciate the excellent quality of fruit, and where it can be had they are demanding it in preference to imported stock.

There is an increasing desire on the part of the farmers throughout the province to get their trees of early varieties grafted over to longer keeping fruit, and this a movement which the Department of Agriculture, through its Fruit Division, is doing all it can to assist. Too many trees of early varieties were planted in the past, and under conditions and in widely scattered locations which prevented co-operation in marketing. The result was that in some years we had gluts of early apples, and these discouraged our farmers to a considerable extent from taking proper care of their orchards and increasing their plantings. Since then, however, a considerable proportion of this acreage of early varieties has ceased to be a producing factor, and with the grafting over to later varieties of a considerable proportion of the balance, and with the newer plantings of longer season fruit, the prospects for apple growing in New Brunswick are brighter than they were ten and fifteen years ago.

Bridge Grafting Fruit Trees.

Bridge grafting (the use of scions or small limbs to connect the cambium above and below a large wound or girdled strip) may be practiced successfully on almost any kind of fruit tree that can be propagated readily by grafting. It is used more often with the apple than any other fruit, but pear trees often are treated in this way. There seems to be no reason why the method should not also be successful on plums and cherries, according to farmers' bulletin No. 710. Peaches, however, graft less readily and there may be some question as to the usefulness of the method in the case of this fruit.

Mechanical injuries which may be remedied are usually inflicted by animals, by burrowing insects or by implements carelessly used. Various diseases, such as pear blight, also cause local injuries which may call for bridge grafting. The trunks of pear trees are not infrequently completely girdled and killed by pear blight. Bridge grafting, if done in time, however, may save the tree. The method also is useful when large acreas of bark have been killed by sum scald or other troubles. Protection of trees against rabbits and mice and disease is, of course, better than having to



INCREASED SEPARATOR EFFICIENCY

THE best cream separators often fall below expectation simply because they are not properly lubricated. The separator is your most delicate farm machine. It demands an oil especially made to suit it.

Standard Hand Separator Oil

is just such an oil. It is made for separators and it is of just the right body to quickly reach those finely adjusted, close-fitting bearings. It protects them from all wear. It enables your separator to deliver ***all*** the butter fat. There is no better oil made for your separator. Ask your dealer for it.

Insure Your Crops with a Spramotor

It isn't a SPRAMOTOR unless we made it

You find it good business to insure your life, your health, your home, then why not insure your crops upon which your livelihood depends. A few minutes work with a Spramotor at suitable intervals will rid your crops of fungus diseases, and assure their arriving at maturity in that hard, healthful condition that secures first-grade prices. We have Spramotors adapted for every kind of spraying in every part of the world. Let us quote you prices and terms to meet your own special needs. Meanwhile write for a copy of our booklet which describes the various styles of Spramotors and gives valuable information about the treatment of crop diseases. Made in Canada. No duty to pay.

bridge graft to overcome damage.

How to Bridge Graft.

To be effective, bridge grafting should be done in the spring before growth starts, though sometimes it can be done after growth starts if dormant scions for the purpose can be secured. Prepare the wound in the tree by cutting away all dead tissue and thoroughly cleansing the injured parts. If possible, sterilize by washing with a solution of bichloride of mercury, copper sulphate, or some other antiseptic. The irregular edges of the bark above the girdled tract or wound should be cut back into an even edge, far enough from the wound to make certain that healthy cambium is under the bark.

For the grafting, select scions from wood of the previous season's growth, either branches which grew the preceding season of water sprouts that are only a yearold. The scions should be a little longer than the space which is to be bridged, so they will arch slightly over the central part of the wound.

Bevel the scions at each end on the same side of the scion with a long sloping cut, so that the wedged-shaped ends thus formed will be relatively thin and permit their long thrust well under the bark without danger of separating it unduly from the cambium at the points of insertion. The placing of the scions will be facilitated if the bark at the margins of the wound is slit for a short distance at the points where the ends are to be inserted.

Importance of Uniting Cambium.

In placing the scions it is of the greatest importance that the cambium of the scions which is exposed in the sloping cuts at the ends be brought into intimate contact with the cambium that lies under the bark at the margins of the wounded area. The union of scion and tree can accur only where the cambium layer of the two come together. The scions may be secured in the proper positions, if need be, by driving a small nail through each end into the trunk. This will aid in drawing the cambium of scion and trunk closely together.

The operation is completed by thoroughly covering the area occupied by the ends of the scions and the margins of the wound with grafting wax, strips of waxed cloth, or by some other means that adequately will prevent these parts from drying out. Some operators cover the entire wound, scions and all, with melted wax.

Where the wound is so large as to make ordinary bridge grafting impossible, another method of bridging may be used. Two-year-old trees are planted about the base of the injured tree and their tops grafted into its trunk above the girdled space, which has first been cleaned as in the other method. As the tops of the small trees are too large to manipulate readily in the manner described for scions, V-shaped vertical grooves extending through the cambium are cut just above the wounded area in the bark of the trees to be treated. The tops of the small trees are shaped to correspond with these grooves. The two are then accurately fitted together in such a manner as to bring the cambium of one into contact with that of the other. Small nails may be driven through the tops of the trees into the trunk, to hold the parts firmly together. The wounds incident to joining the tops of the small trees to the trunk of the large one should be well covered with wax, to prevent drying out.

Practical Gardening Tools

TOOLS like these will do all of the necessary work (except plowing and harrowing) economically, whether for home, farm or market garden. You can plant certain crops close and straight, and work them close and safely, with wheel hoes. You save ground, save heavy investment for tools at the start and yet do the best kind of work with practically no labor.

IRON AGE *Hand Seed Drills and Wheel Hoes*

Will sow, cultivate, ridge, furrow, etc. better than you can with any old fashioned tools and ten times quicker. Pushed ahead a step at a time, these tools can be worked by women, or grown boys or girls. We show here a few only but we make 38 styles and combinations from which to choose. Prices, $3.00 to $14.50. There are also many attachments for special work.

Ask your dealer to show them or write for booklet "Garden Tools of Modern Tools." Also, for horse hoes, harrows and cultivators, sprayers, etc.

STRAWBERRY PLANTS

Our Strawberry Plants Grow. Many people have become discouraged in trying to grow strawberries and given up in disgust because when plants were bought, they often arrived in a dead or dying condition. It seems a big thing to say, but in the last three years we have not had one camplant from a customer as to the quality or condition of stock on arrival. We only ship freshly dug plants, and take particular care that they are never exposed to the sun or allowed to dry off. In digging, we take up the whole row, but we do NOT send out all the plants that grow in the fields. We know that big crops do not grow from small plants. Let us send you our price list and have your order booked early; you need send no money until you want the plants shipped. We had orders for one hundred thousand plants last season after our stock was exhausted. We have this year, Senator Dunlap, Sample, Arnout, Valeria, Ophelia, etc. Catalogue and order blanks free.

DAIRYING.

A Practical Plan for Keeping Cream in Good Condition on the Farm.

By H. C. Beckman, Manager, De Laval Department of Dairy and Creamery Improvement, Chicago Office.

One of the interesting problems worked out by our Department of Dairy and Creamery Improvement during the past year has been the proper care of cream on the farm. A very large percentage of the users of hand separators through lack of proper facilities, and to some extent, also, through lack of a proper understanding of the requirements, do not deliver their cream to the creamery or cream buyer in as good condition as it should be to insure the greatest amount of profit possible for the product.

It goes without saying that good butter cannot be made from poor cream. Poor butter is not only a drug on the market, but even then must be sold at a sacrifice in price. The price the farmer receives for the cream is directly dependent upon the price for which the butter made from this cream is sold.

Cream Should Be Held at Proper Temperature.

There are a number of factors that affect the quality of the cream, but by far the most important of these is the temperature at which the cream is held. Were it possible to deliver the cream every day or say four times a week, this would not require so much attention, but it is out of the question for a farmer living from five to twenty miles from the creamery or railroad station to deliver his cream every day, or even every two or three days.

Cream Can Easily Be Held for a Week Under Favorable Conditions.

Cream produced under reasonably sanitary contditions can easily be kept in first-class condition for three or four days or even for a week if it is held at a temperature low enough to prevent bacterial development. Souring or spoiling of cream is due almost wholly to the action of the bacteria present in all cream. These bacteria are in reality extremely small plants, and like ordinary plants, they grow or propagte more rapidly in a warm temperature than they do in a cold temperature. Below a temperature of 40 degrees this bacteria life is practically at a standstill. At 50 degrees there is some development, but it is not until a temperature of 60 to 70 degrees is reached that the bacteria really begin to develop in earnest.

Cream Should be Kept Below 60 Degrees

In a sample of milk held at a temperature of 50 degrees there were at the end of 24 hours, 7 bacteria for every one at the beginning. In a sample of milk held at 70 degrees, there were at the end of 24 hours, 700 bacteria for each original one. At the end of 48 hours there would probably have been approximately 10,000 times as many bacteria in the can held at 70 degrees as in the can held at 50 degree. Below 60 degrees the development is comparatively slow, but above 60 degrees the development increases by leaps and bounds, therefore it is very desirable to keep the cream below 60 degrees, if possible.

Well water as a rule has a temperature below 60 degrees, so the first thing that suggests itself is that if we could keep cream at the temperature of well water, nine-tenths of our troubles would be over. Some farmers do keep their cream in cans hung in the well, but this is not only a lot of bother, but the air in the bottom of the well usually has a stale, dank odor which the cream takes up.

Tank Developed by the De Laval Company to Hold Cream at Proper Temperature

The thermos bottle and fireless cooker have during recent years demonstrated that keeping cold water cold or hot water hot is merely a question of insulation. We, therefore, conceived the idea that if it were practicable to construct a tank that was perfectly insulated on top, bottom and sides and connect it up so that all the water used on the farm for stock, etc., would flow trhough this tank, the water in the tank would always be at practically the temperature of well water and a can of cream kept in it would be held at sufficiently low temperature to keep it in good condition for several days.

With this in view, the De Laval Department of Dairy and Creamery Improvement had made a dozen or more different types of cream storage tanks to be tried out. These tanks cost all the way from a few dollars apiece up to as high as $160.00. Careful tests were made to note the efficiency of each tank for holding the temperature of the water with a can of cream set in it. We soon discovered that in the tanks not properly insulated against heat, the influence on the quality of the cream was not appreciable.

Cream Tank Constructed on the Same Principle as the Thermos Bottle

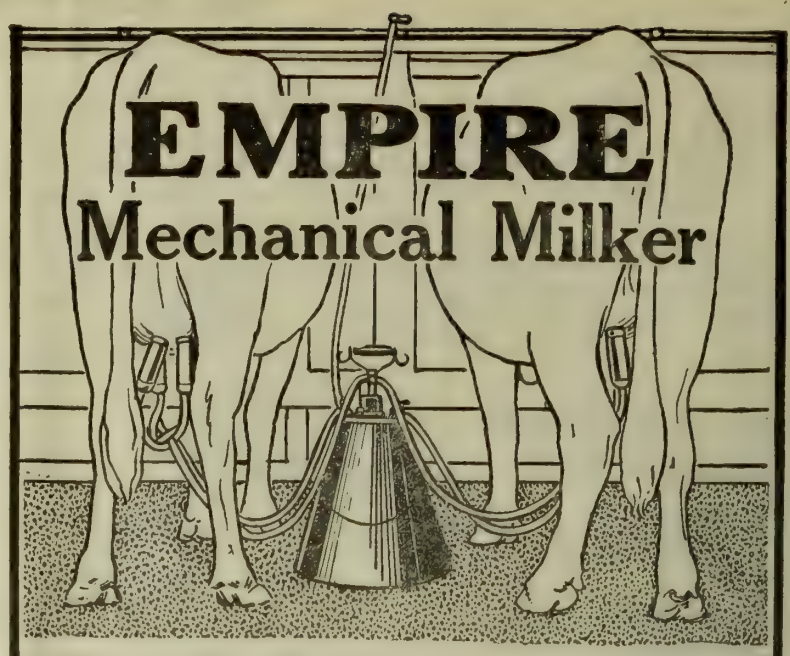
On the other hand, in those tanks that were scientifically insulated with granulated cork, felt, etc., in proper proportions, there was but very little change of temperature in the water. A ten-gallon can of cream kept in a tank a week with the atmospheric temperature averaging over 100 degress in the day time and 85 degrees at night showed a temperature of 59 1-2 degrees at the end of the week.

As a result of our experiment, we had 50 tanks made up of a type which were moderate in first cost, simple, durable and convenient to take care of and yet possessing all the necessary heat excluding properties. Twenty-five were furnished to the patrons of creameries in South Dakota and 25 to the patrons of creameries in Oklahoma. These tanks were put out under the supervision of our Dairy and Creamery Advisory Experts and the performance of each tank was carefully watched. The results were most gratifying. Farmers who before they had these tanks were furnishing the poorest cream, immediately began furnishing the best cream. Buttermakers were astounded and could hardly believe their own eyes. In one case cream was kept perfectly sweet for over one week during a period of very hot weather.

Why Wise Garmers are on the Dairy Cow's "Pay Roll."

Myron Townsend, New York, writing in the De Laval Monthly, says:—

Consider the dairy cow as a wealth



EMPIRE
Mechanical Milker

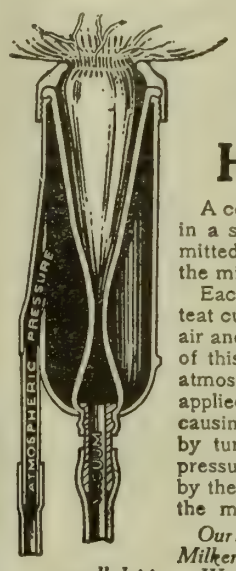
Takes all the Drudgery out of Dairying—
Turns Wages Into Profits

Frees you from depending on hired help—
Makes it possible to keep more cows—
Milks them more Regularly and Uniformly—
Coaxes them to Let Down Milk more Freely—
Protects the Milk from Dirt, Germs and Odors

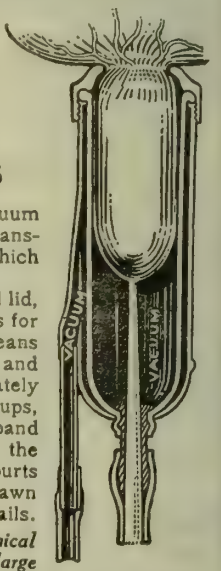
What it Accomplishes

One man with one double or two-cow unit will milk 20 to 30 cows per hour—one man can operate two double units. An Empire Mechanical Milker will quickly pay for itself with even a very few cows. With one or two double units you can handle a good big herd alone, and do it quickly and easily.

The "Empire" so successfully imitates the action of a sucking calf that it is easier on the cows than hand milking, and usually gets more milk. Flowing directly through the tubing from the closed teat cups to closed pails, the milk is always protected from stable air, dirt and germs



Thus, the "Empire" gets more and better milk, saves time and wages, and solves the serious problem of hired help.



How It Works

A compact air pump creates a vacuum in a steel tank. This vacuum is transmitted along the stalls by piping, to which the milking units are connected.

Each unit consists of a pail, a pail lid, teat cups complete with connections for air and milk, and a Pulsator. By means of this Pulsator, vacuum (suction) and atmospheric pressure are alternately applied to the linings of the teat cups, causing them to collapse and expand by turns, massaging the teats by the pressure, then drawing the milk in spurts by the suction. The instant it is drawn the milk flows into the closed pails.

Our literature about the Empire Mechanical Milker is of interest to owners of either large or small dairies. We will send it to you on request without any obligation to you. Just write us saying, "Please send me information about Empire Mechanical Milkers". Address Dept. L 31

Eureka

Potato Planter

Catalog sent free

The Eureka line of Potato Planters is the largest manufactured. This machine takes only *one* man to operate it. That means less trouble and expense for *you*.

Opens the furrow—drops the seed any distance or depth required—puts on fertilizer (if desired)—covers up—marks for next row. Always accurate and automatic.

It's an easy machine to operate. The steel and malleable iron construction mean lightest possible weight and increased life of machine. Your repair bill will be practically nothing. Plants uniform depth at *all* times because plow is directly under the axle. Dropping mechanism in plain view of driver. Does not injure seed.

We supply planters in three sizes, for one or two rows—with or without Fertilizer Attachment.

For 16 years the Eureka Potato Planter has been successfully used throughout the world.

We also make Eureka Potato Cutters and the Eureka Mulcher and Seeder—a mulcher, smoothing harrow, cultivator, weeder, seeder.

Montreal, Que.

Bulbs--50 High grade flowering bulbs, Gloxinias, Begonias, Oxalis, Gladiolas and other kinds also asparagus fern; all postpaid, 25c. Pine Tree Nursery, Pemaquid, Me.

producer! Her other name is "ready cash!" From her such sources of revenue as butter-fat and skim-milk flow!

Who but the cow is the originator of the "cream check" Animated machine though she be, the consumer of his silage and his roughage, isn't she the one friend of the farmer that fattens his bank account twelve months in the year? Nor is this all! She is the mother of the calves and the sole author of the sustenance from which they are fed the first months of their lives. Few cow owners appreciate how valuable her warm, sweet skimm-milk is for the young stock of the farm!

And the yellow butter-fat! What is it but so much gold! Even after the De Laval Separator extracts the butter-fat from the whole milk all the bone and muscle forming elements are left. How warm, sweet separator skim-milk makes the calves, the pigs, the chickens grow! And it comes from the cow!

For every dollar's worth of fodder fed her she returns 100 per cent in dividends. Instead of robbing the soil of its fertility by selling off your produce feed it to the cow!

Then the solid and liquid wastes from her body! Do they not keep up the fertility of the soil? In converting hay and grain and grass and silage into milk and money isn't the manure her most valuable by-product? What a boon the dairy cow is to the impoverished soils of "run-down" farms that lack many of the elements that make plant life flourish.

Who ever heard of an "abandoned dairy farm" where a good Separator was on duty removing the butter-fat, after which the warm, sweet skim-milk was fed to the calves or the pigs?

But there is still another source of revenue from the dairy cow. Even her old, worn-out body, about to succumb to wear and tear, has its market value! Her carcass can be sold to the butcher and her hide to the tanner!

Farmers are deeply indebted to the dairy cow! They are on her "pay roll! She furnishes them a steady cash income in fat months and in lean and she makes their fields more fertil and porductive.

Blessed be the cow! How could the world live without her? What a blessing she is to babies and how indispensable she is to adults! Consumers of diary products—men, women and children everywhere—echo the sentiment: blessed be the cow! All people pay homage to the source of their sustenance, to their humble servant, the uncomplaining cow! Benefactor of all mankind!

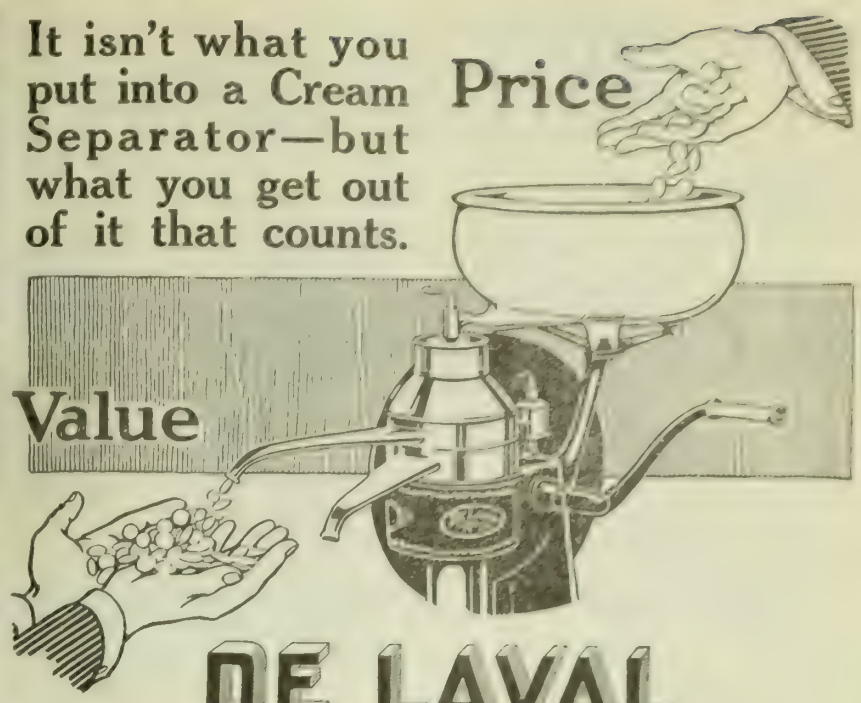
And how much the cow contributes to the wealth of the community! Her ver presence makes the mother earth more productive. She not only tends to elevate and enrich her owner but she furnishes food for his family and he sells the surplus to his neighbors. Cash circulates more freely and merchants feel the stimulus of such a steady flow of milk-money! No cream check, no cow!

Few men who form partnership with the cow ever complain of hard times! If they treat her kindly and develop her milk producing possibilities intelligently they never consort with the chronic calamity howlers who outrage nature by bankrupting their soil with grain crops and then blame failure on the political party in power!

Pages and pages could be written in praise of the dairy cow! But "So, Bossy" needs no lengthy elogium.

Her name is so linked with prosperity in the minds of farmers, bankers and merchants that her achievements, alone, entitle her to first place in the hearts of those who follow agricultural pursuits for their livelihood.

It isn't what you put into a Cream Separator—but what you get out of it that counts.



DE LAVAL
Cream Separators are by far the most economical

REAL economy is never short-sighted. It never confuses PRICE with VALUE.

PRICE is what you pay for an article—what you put into it.

VALUE depends upon the amount and quality of service the article gives you—what you get out of it.

You get by far the greatest actual VALUE for your money when you buy a De Laval—BECAUSE it will give you much better and longer SERVICE than any other separator.

From the standpoint of its greater durability alone the De Laval is the most economical cream separator to buy, and when you also take into consideration its cleaner skimming, easier running, greater capacity and less cost for repairs, the price of the "cheapest" machine on the market is most exorbitant compared with that of the De Laval.

And there is no reason why you should let its FIRST COST stand in the way either, because the De Laval may be purchased on such liberal terms that it will actually pay for itself out of its own savings.

A De Laval catalog to be had for the asking tells more fully why the De Laval is the most economical cream separator, or the nearest local De Laval agent will be glad to explain this and many other points of De Laval superiority. If you don't know the nearest local agent, simply write the nearest De Laval main office as below.

LIVE STOCK.

Lambing Notes.

At lambing time the shepherd should be provided with one or more assistants, according to the size of the flock and the work to be done. An assistant should always remove and bury the afterbirths, and also skin and bury the carcases of dead ewes and lambs not required for dogs' food. All post mortems, too, should be made by an assistant under the shepherd's directions, so that the latter's clothes and person may be kept as free from taint as possible, lest he convey disease to those ewes that need his assistance. For the same reason a separate assistant should feed and look after contagious cases under the supervision of the shepherd, and such assistants should have little or nothing to do with the healthy ewes and lambs, or disease may be spread broadcast. Disinfectants should be freely used in and about the lambing yard, and the shepherd should be careful to wash and disinfect himself and his instruments after attending a bad case. All vessels used for milk, medicine, etc., need to be kept as clean as possible, and every hygiene measure taken to ward off and curtail disease at this critical period. In spite, however, of every care and precaution, certain ailments are sure to be present at lambing-time, and as veterinary assistance rarely sought unless an epidemic prevails, the shepherd or flockmaster should be provided with suitable remedies for use when required; but, as special knowledge is needed for compounding drugs, it is better to let a chemist prepare all but the simplest mixtures, or to buy suitable remedies from a well-known make of veterinary medicines.

One of the duties of the shepherd is to assist those ewes that need aid. As a general rule he is in far too great a hurry to lend this assistance, and the ewes would do bteter and there would be less "inflammation," and a lower mortality, if he could be induced to let them alone. Flock-owners should impress on their lamber that assistance should never be premature or too hurried. Different ewes occupy different times in delivery, and cold weather protracts labour. The amount of time that has elapsed since labour began is of less importance than the indications of need for assistance. These are principally increasing weakness and protrusion of the tongue, with a black colour of the organ. Instead of the "grease or oil for the lubrication of the passages, instruments, and hand in aiding delivery," a ple supply of carbolised oil should be provided for this purpose. In the arrangement of lambing sheds or yards it is most desirable to provide a hospital pen, near to, but not communicating with the main erection, to which bad caess can be at once removed and receive separate attendance. Another point worthy of attention is the removal of soiled litter; it is not sufficient to cover bedding that has been contaminated by uterine discharges with a thin layer of clean straw. Dead lambs and foetal membranes should always be promptly removed from the vicinity of the lambing sheds; nothing is more common than to see old "cleanses" lying about the main yard, and, of course, nothing could be more unsanitary. The shepherd should not be permitted to make post-mortem examinations or to flaw dead ewes or lambs before adopting precautions, and from the outset carbolised oil should be supplied to the lamber and freely used as a lubricant in all cases requiring assistance, as well as for anointing the umbilicus of newly born lambs. When a case of parturient septicaemia, puerperal fever, metritis, peritonitis, "heaving," "inflammation," or any other disorder incidental to the lambing occurs, the animal should be promply isolated and receive separate attendance. There are a great many disinfectants available for general use, apart from the local employment of carbolised oil, and but for its highly poisonous character a solution of perchoride of mercury would be best. Crude or commercial carbolic acid is most frequently employed on account of its efficiency and cheapness, but the several akaline solutions of coal tar, sanitas, and other proprietary preparations are, perhaps, somewhat more convenient, less dangerous, and quite as efficient.

"Joint-ill."

Another reason for the free use of antiseptics and the adpotion of sanitary precautions, is the effect they have in preventing joint-ill and navel ill in the lambs. These are still popu larly regarded as two distinct maladies, and the swollen joints are supposed to be of rheumatic origin and due to exposure to cold and wet. This exposure may aggravate matters, but the disease is now fully established to be pyaemia (blood poisoning). The two conditions are invarialby associated, and there is but little doubt that the umbilicus, which immediately after birth is practically an open wound, is the point of entry for septic matter.

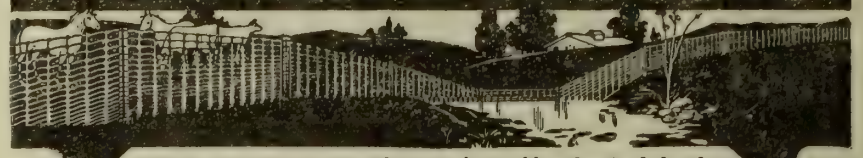
if cod-liver oil (as used for stocks) is procured it will be found excellent for weakly ewes or lambs if given in suitable does. For suckling purposes ewes' milk is undoubtedly the best, but as the supply is limited recourse is generally had to cows' milk. The milk from one cow only should be used, as mixed milk is apt to upset the lambs' stomachs. Personally I prefer the milk of a recently-calved animal, but some people think it is best for the cow to be in-calf again, others that a heifer's milk is best, but all will, I fancy, agree that milk from a stale-milched cow, or one that is in service, is not suitable for young lambs. The milk should be given at the same temperature as when it is fresh-drawn, care being taken that it is not sour or burnt, and that the milk-vessels are all sweet and clean, or the lambs will probably suffer from diarrhoea of an intractable nature. Ewes while suckling their lambs should get a good allowance of hay, oats, bran, and chaff, in addition to roots, grass, or other green food, for, unless well fed, they cannot be expected to milk well, and the lambs will suffer in consequence. As soon as the lambs are old enough to eat they should be supplied with some good linseed-cake broken small and placed in troughs land rather than among mountain out of the ewes' reach. On pastures this can be done by surrounding the lambs' troughs with hurdles provided with creeps for the lambs to pass through; if the flock are in hurdles the troughs can be placed out side the fold, and creeps arranged for the lambs to run forward.

E. H. S., in English Exchange.

Heaving or after pains in Lambing Ewes.

"Heaving" occurs apparently as an epizootic; but, in common with other otubreaks affecting a number of animals at one time, this may as readily be due to exposure to similar conditions as to feeding and management as to contagious or infection. We find it more prevalent in the south than in the north of England, among low-breeds, and in those flocks receiving turnips or artificial foods rather than those having to search for their living. I have seen high feeding suggested as a cause of straining. Want of exercise has something to do with its production; thus it occurs in ewes fed on turnips or luxuriant pasture, such as does not necessitate the animal walking about much to obtain a sufficiency. Though to a certain extent "heaving" is a healthy operation of nature, it often passes the bounds of health and becomes disease. There is no manner of doubt that the straining, often sufficiently severe to cause inversion of the uterus, or vagina, arises from violent contraction of the womb in the effort of nature to restore it to its natural size. There seems nothing about the disease to warrant the conclusion that it is infectious. The

UNDER WATER 4 YEARS AND NOT RUSTED



Think of it! A galvanized fence so thoroughly galvanized that four years of submersion—summer and winter—could not faze it. That's Mr. Cummings' experience with Peerless Fence. Read what he says. Here's his letter.

Gentlemen—I have handled your fence for four years and find it a good, strong and durable fence, and find that the galvanizing is first-class. In referring to this I have a fence that I put on four years ago across a gulley and the water is as high as the second wire and it is not rusted nor broken yet. I have a team of heavy horses that ran into the fence last summer and did not break or damage it in the least, and I am glad to say that in the four years I have handled your wire I have had no complaints about it.
Yours truly, DAVID CUMMINGS, Bowesville, Ont.

Increditable—unbelievable—you say? Not when you remember that

Peerless Perfection Farm Fencing

is different—that it is made of Open Hearth Steel Wire. The Open Hearth process burns all the impurities out of the metal, thus removing one of the greatest causes of rust. The wire is also galvanized so thoroughly that it will not flake, chip or peel off. Every intersection of the wires in our farm and poultry fence is locked together with our Peerless Lock. While these locks hold the wires securely together, this fence can be readily adjusted and perfectly stretched over uneven ground. It is easily erected and on account of heavy, stiff stays used, fewer posts are required. Get the details. Send for free literature. It also describes our farm gates, poultry fencing and ornamental fence.

Agencies nearly everywhere. Agents wanted in unassigned territory.

SHAW'S SCHOOL, Toronto, Canada
W. H. Shaw, Pres.

absence of inflammation has been demonstrated by examination of specimens of uteri removed from ewes killed in the early stages of the disease, and it seems that metritis occurs in "after-pains" as a result of progress or neglect, and not in the initial stage.

The Symptoms.

It generally affects the best ewes, carrying off the pride of the flock at a rate varying from 4 to 20 per cent. of the whole. It may follow either an easy or difficult labour, but most commonly affects those in which it has been natural, and the lamb yeaned without difficulty. It usually appears about the third day after lambing, and the first symptom is generally the passage of high-colored urine, with severe straining. If this goes on long, the breathing becomes quickened, the ewe lies about, refuses food, and neglects her lamb. There is not at first so much fever as in inflammation of womb, but soon the symptoms become indistinguishable from it. Pressure over the loins causes yielding, the hind parts swell, there is pain and difficulty in moving if forced to do so, and the urine passed is contaminated with uterine evacuations. Complete loss of power, constant recumbency, dullness of the eyes, and drooping of the ears show mortification to have taken place, or death results from absorption into the blood of purulent products.

Prevention and Treatment.

Prevention seems to be possible by feeding judiciously. enforcing sufficient exercise, and avoiding extreme plethora. The opposite, of anaemia or debility, mus, of course, be equally avoided, lest a worse thing come upon us in the shape of the many diseases following in the train of this condition. The free use of carbolic oil at lambing time, by anointing the parts and the hands of the lamber in those cases requiring assistance, an dpouring a small quantity into the pudenda in those that yean naturally, is to be commended, not only on account of the antiseptic properties of the oil, but because it has a sedative action also.

Treatment consists in the administration of sedatives, but early resort to diffusible stimulants is necessary to prevent sinking of the patient. At the first sign of straining or heaving another injection of carbolised oil should be given, and the following mixture is recommended: Tincture of opium, ½ oz., spirit of camphor 5 drachms, in gruel. This should be repeated in half doses in two to four hours. As a stimulant, give a mixture of ether, sal volatile, and sweet nitre, of each 1 drachm, in ale. Epsom salts is sometimes administered, and bleeding resorted to, but these should only be attempted in the early stages.

E. C. S.

Folding Preginant Ewes.

Experience goes to show that an exclusive turnip diet, or even a system of management where many turnips are given without compensating dry food, or run at pasture, is quite incompatible with "luck" at lambing-time. A little search through works on sheep management and diseases, both technical and popular, or the agricultural journals, will afford abundant evidence of bad lambing-times that have been distinctly traceable to the excessive use of roots in seasons when roots have been unusually abundant—so much so that it has passed into a proverb that "a good root year means a bad lambing year," or "yeaning-time." This is not mere theory, for from time to time we get placed on record the experience of practical men as to the effects of a great quantity of roots on in-lamb ewes. The mischief is not confined, in the case of pregnant animals, to the effects of a full quantity of watery roots on the system of the ewe, but

THE HORSE

What some Horses said to their Master.

This is what some horses said to their masters at the close of the day's work:

Jim:—Good master, there is a sore on my hip. I cannot see it, but when the line rests on it, or the whip hits it, it gives me great pain. Will you please see what causes it and try to cure it? It may be from a nail in the floor. Would you also give me a little thicker bedding? Then try me without a whip. A few more oats and a little less work will do more than the whip.

White Face: — My master, why did you strike me on my face today when my feed-bag fell off? I did not get half my dinner, and was it my fault or yours that it was not properly fastened on?

Star:— When you send me out on the grocery team tomorrow will you please tell the boy who drives me not to make it harder for me by taking on a number of boys, using the whip all the time, and fairly racing me over my route?

Sam:—Master, when Tom and I were doing our very best to draw that heavy load up that steep hill, why did you continually jerk the reins, whip us and keep calling "gid up," "gid up?" And when we saw where we could have a better foothold, instead of jerking us from one side of the road to the other, why did you not let us take it?

Ned:—When I was frightened almost to death yesterday and tried to escape, which is just what you would have done in such a fright, did it make me less frightened to be whipped and yelled at, and cursed for it? You only made it harder for me, when a kind gentle word and a soothing touch of your hand would have quited me and made me feel that you were my friend and would have saved me from danger. Why my master did you not give them?

Dick:—I do not like to complain, but if on a cold winter morning you would warm the bits before putting them in my mouth, I should feel much more comfortable. I once knew a master who always did that for his horses and they appreciated it.

Lady: — Will you please, kind master, loosen my check rein, especially when I am going up hill? All horses could keep up their gait longer and more easily if checkreins were looser. Please try it when I go out again with the carriage.

Old Jerry:—You have been a good master to me for many years, and I have tried to be faithful to you. But I am old now and feeble and must soon die I want to thank you for all your kindness and am sure you will do as well by your other horses as you have by me. We horses appreciate kind treatment, and each one of us wishes to do the very best he can for his master, and the kinder care he receives the better he can work. Although the Heavenly Father has denied us the power of human speech, we have a language of our own, and so we talk over our masters and our daily lives with each other, and we are glad always to tell of a gentle pat ,a kind word or a lump of sugar. We are not without affection for those who are good to us, and I wish that every man would treat his animals so that he could truthfully say

"That mercy I to other show
That mercy show to me."

Good night, dear master. A few more nights and you will mercifully help me across to that other shore where no morning call of your can reach the ears of Old Jerry.

Mrs. L. M. HILLS,
in Our Dumb Animals.

Advertising Stallions in Indiana.

The Indiana Stallion Enrollment law makes advertising simple and easy for the stallion owner, plain and exact for the printer, and honest and instructive to the farmers and breeders of the State. The stallion owner looks largely to advertising to call the attention of the public to his business.

There are three principal lines through which he may advertise, namely, the local papers, circulars to be distributed through the mail, and posters.

Advertising has come to be recognized as a splendid medium through which to attract the public. Honest advertising which tells essentials and which conceals nothing vital is the kind that is in demand today. Honesty and reliability spell success for the advertiser in any line. So it is with the stallion business. An ad. placed in the local paper, and attractively written, will earn many times its small cost.

To comply with the stallion enrollment law in newspaper advertising, is simple. The owner must have in his possession an official certificate of enrollment before he may advertise at all. That certificate of enrollment has a number. Section 9 of the law, which concerns advertising, specifies that the enrollment number must be used in newspaper advertising and statement must be made as to whether the stallion is pure-bred," "grade," "scrub," etc., and whether "sound" or "unsound." In addition, the stallion owner may state all he cares to regarding pedigrees, fees, location, etc. Nothing may be stated that is at variance with the provisions of Section 9 or that is misleading in any way.

Requirements for letter-heals, circular postcards, etc., are practically the same as for newspaper advertising.

Posters must contain the following in accordance with Section 9.

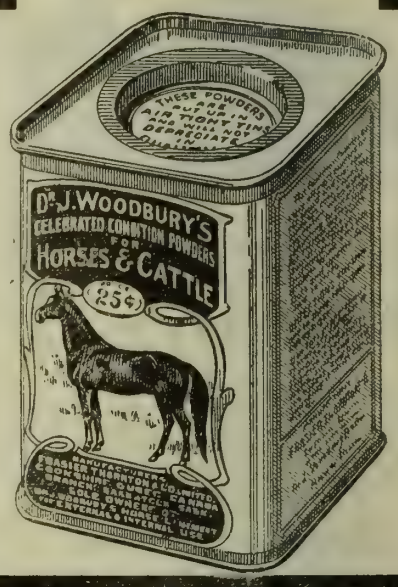
1. An exact copy of the certificate of enrollment.
2. Enrollment number.
3. Statement as to whether "pure-bred," "grade," "scrub," etc.
4. Statement as to whether "sound or "unsound."

In addition, progressive stallion owners state their fees, terms, location and other things which mean good business. Two posters must be used at the home stable and at all other places where the stallion is used for public service. The Enrollment Board furnishes two posters free with each enrollment and supplies additional ones at slight cost. Posters may be made by a local printer that fulfill the requirements of the law and which may be used upon stables.

Cuts from photographs of the stallion may be used in advertising. Anything not from an actual photograph must be labelled as not a true picture in any advertising in which it may appear.

The public must depend upon advertising for information concerning stallions and jacks available for use. In this, the public has the protection of the law, in that, no fees may be collected through court if incorrect advertising has been used or if the owner has failed to use posters as required in Section 9. The breeders are looking to advertising as a chief source of information concerning available stallions. Now that the law requires advertising to be correct in all statements the public is depending upon it to a marked extent.

The Enrollment Board is assisting the stallion owners of the State in an active advertising campaign. Copy sent to the office at Lafayette is examined and corrected, and if possible, improved. It is the desire of the Board



Cured Biliousness Prevents Bright's Disease

The Certified Statement of One Who Has Proven the Efficiency of Dr. Chase's Kidney-Liver Pills.

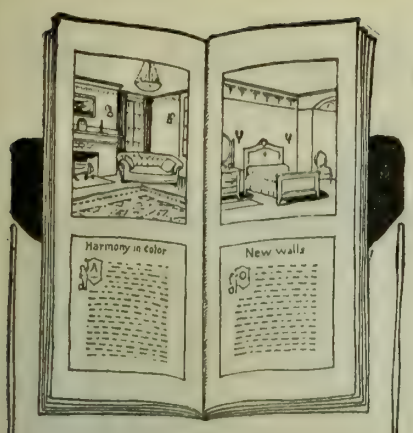
Mr. Colin M. Kiel, Craighurst, Simcoe county, Ontario, writes: "My mother and I have both used Dr. Chase's Kidney-Liver Pills with great satisfaction. We find that there is nothing to equal them as a prompt cure for torpid liver, biliousness and indigestion. Some years ago my mother came near to death from kidney trouble and has to be careful in preventing Bright's disease. By using Dr. Chase's Kidney-Liver Pills occasionally she keeps the kidneys healthy and active. Another point favorable to Dr. Chase's Kidney-Liver Pills is that they do not gripe and yet accomplish good results. You are at liberty to use my letter."

This statement is endorsed by Mr. Marmaduke Caston, Justice of the Peace, who writes: "This is to certify that I am personally acquainted with Mr. Colin M. Kiel and believe his statement regarding Dr. Chase's Kidney-Liver Pills to be true and correct."

If you are interested in this case, write to Mr. Kiel, enclosing stamp for reply, and he will verify his statement. We like to have people to do this, for we are very careful to only use statements from responsible persons.

Should this case not be similar to yours, write to us for the statement of some one whose trouble was along the same lines. We have thousands of letter to choose from. Or better still, put the KidneyLiver Pills to the test right away. They will only cost you a quarter and a box lasts for some time.

As a means af awakening the action of liver, kidneys and bowels and thereby curing biliousness, indigestion, backache and kidney troubles, Dr. Chase's Kidney-Liver Pills hold a unique position. By their combined action on these eliminating organs they prove effective in complicated ailments which defy ordinary treatment. One pill a dose, 25 cents a box, all dealers or Edmanson, Bates & Company, Limited, Toronto.



Going to Decorate?

If you are going to "do" the dining-room or the bedroom, or even the kitchen, this spring, you need this book. It illustrates in photogravure, in colors, rooms done with Alabastine. It contains suggestions and ideas for color schemes, and it shows how you can do the work yourself.

Alabastine

Artistic Wall Tints

A copy of "Homes Healthful and Beautiful" costs but 15c. (coin or stamps), but if it saves you from making even one mistake—and there is nothing easier to make than mistakes in color—will it not pay for itself a hundred times over? Then send for it now and study it before you start housecleaning.

ADVERTISE IN THE MARITIME FARMER TO GET RESULTS.

that all advertising shall be correct in order that the public shall have correct information and in order that stallion owners need lose no fees on account of incorrect advertising.

It pays to advertise in the horse business. The stallions that are most advertised today are the ones that are bringing the largest revenue to their owners. A letter containing a copy of Section 9 is sent with every enrollment along with explanation on some features. The stallion owner has only to use this letter, following the instructions, and the requirements of Section 9 of the law to provide himself with advertising which will be legal, and which will bring his business before the public and greatly increase his success.

H. E. McCARTNEY,
Assistant in Animal Husbandry Extension and Secretary Stallion Enrollment Board.

Slipping Horses.

(From the Cleveland Plain Dealer.)

For making a poorly shod horse pull a load too heavy for his weight up a slippery hill a Cleveland judge fined a driver several times what it would have cost to take the animal to a blacksmith shop. It would be unfortunate if the lesson of the incident reached no one but the one offending driver.

Many weeks of slippery weather remain before horses in worn-out shoes can be sure of their footing on city streets. Few better ways exist for indicating one's humanity than in giving the animals one drives a chance for their footing. A horse straining himself to keep from falling while pulling a load perhaps too heavy for his weight is a reflection upon his owner.

If teamsters would load more lightly when streets are treacherous with ice and snow, and then give their horses shoes that permit them to keep their feet, they would do themselves as well as their animals a favor. Needless to say, most owners and drivers of horses meet the requirement.

Mare with Lampas.

I have a young mare suffering from lampas. Could you tell me the best way to treat her, and cure?—Milkman.

Answer: "Lampas," concerning the character of which there exists a great deal of misapprehension, and also needless anxiety, is the name given to a swelling which arises from congestion of the blood-vessels in the lining membrane of the palate, the enlargement of the bars being mostly seen in young horses during the process of teething. It occurs occasionally in old horses from irregularities of the teeth, or it may arise in any animal from inflammation set up by bit injuries, but for all practical purposes "lampas" may be regarded as a juvenile trouble, and as the mare in question, said to be "suffering from lampas," is described as young, the probable cause is dental changes. Owing to inflammation of the gums set up by irritation caused by the eruption of the permanent incisors extending to the palate, it swells and becomes level with or even projects beyond the nippers, and causes feeding to be a somewhat painful business. Colts at grass rarely suffer much, as their food is natural—cooling, tender, and easy of digestion—but the animal that has been taken into work, and fed with hard corn and dry hay, finds mastication painful, and often falls away in condition. Generally, an alteration in the diet to crushed oats and wet bran with scalded chaff, tended green meat in season, or carrots, &c., in winter, at the same time easing the work, will suffice to effect the cure, because in a few days the inflammation and soreness pass away, and the colt can feed again in comfort. In persistent cases, or where the congestion is considerable, and the swelling projects beyond the incisors, all that is necessary is to lightly scarify the swollen plate with a lance or sharp penknife. These superficial incisions result in the flow of a little blood, which promptly relieves the local congestion. A few doses of cooling medicine—say 2 oz. of Epsom salts and a little gentian or aniseed—in the soft food once a day soon results in the disappearance of the swelling.—M.R.C.V.S.

POULTRY

Planting Poultry Yards.

Unsheltered from the rays of the hot summer sun and unprotected from the raw winds of fall and winter a poultry yard will never harbor the profitable flock that lives in the ward well shaded and shielded from the heat and storms. At the Michigan station, young orchards have been planted in many of the yards and additional shade has been produced by growing a cover crop of millet under the trees.

When loaded with fruit in August the young plum trees were bent nearly to the ground and the heads of millet waving in the lower branches formed a mass that made it difficult to see the flock of young White Leghorns which scurried rapidly through the dense foliage. The chickens were protected from the hot summer sun and even the hawk would have had little opportunity to swoop down and carry off one of them.

The planting of fruit trees in the poultry yard is one of the best methods of insuring shade and protection for the flock. Apples, pears, plums or cherries will be satisfactory, but where this method of furnishing shade is used, the plum and the pear are considered the most desirable. These trees grow fairly rapidly, but do not become large enough to interfere with the fences or buildings. Apple trees are not so satisfactory in the yard as they grow slowly and finally run together if they have been planted close enough to be of any shade value when young.

The Best Trees to Plant.

One reason for planting the pear is that it will grow better without cultivation than most other fruit trees. It is difficult to give regular cultivation to the ground in the poultry yard and therefore it is not possible to raise some things there to the best advantage.

Do not place the trees too close to the poultry house as it will be necessary to spray them with the same applications that are used in the large commercial orchard. A Van Buren county, Mich, farmer planted several pear and apple trees in his poultry yard, but they were never sprayed as it was difficult to run the spray wagon into the yard.

He carefully sprayed the remainder of his orchard, but had considerable trouble in keeping down the San Jose scale in the vicinity of the poultry yard. An inspection proved that every tree in the pard was plastered with scale and the sparrows were carrying it back and forth from the unsprayed trees to the commercial orchard.

Spraying Trees in Poultry Yards.

It is rather difficult to spray near the buildings without injuring them, especially if a slight wind is blowing. So plant the trees far enough from the poultry house that they can be sprayed without any danger of the material falling on the painted surface of the buildings.

A long hose can be attached to the spray tank and run through the fence at various points until every tree has been thoroughly covered. In this way the poultry can have the benefit of the orchard shade and the farmer can raise good fruit in the yard. The trees make a healthy growth and there is no danger of plant disease or insect pests being harbored to later be transferred to other parts of the farm.

The planting of a cover crop under the trees before the birds are turned into the run is a desirable feature in the orchard method of shading the yards. The cover crop will hold the leaves that are blown down in the fall and assist in forming a fine mulch on the ground in the yard.

Sunflowers Make a Good Crop.

A farmer in Ingham county, Mich., decided to plant sunflowers in his chicken yards. He raised an excellent growth which formed a fine protection for the birds during the summer and a source of food supply when the seeds were ripe in the fall. His neighbor had a large open chicken yard which was unprotected and the birds were confined in quarters which made it impossible for them to find summer comfort either on the inside or the outside of the poultry house.

White Plymouth Rocks were raised on each farm and in the fall it was easy to tell which flock had been exposed to the hot sun of the summer months and which had enjoyed the thick growth of sunflowers. The unprotected birds developed a roughness of feather not evident in the flock that had been growing in the shaded run.

A combination of fruit trees and rows of sunflower stalks will make a fine shelter for the farm poultry yard. Plant the trees the distance apart for the variety selected and then sow the sunflower seeds in rows lenghtwise of the run.

If the farm flock is confined a large part of the year, the double or triple run is a large factor in the successful management of the business. In the case of the triple run, one of the yards can be used for permanent plantings of such crops as blackberries or asparagus and the fowls can be turned in when there is no danger to the growing crops.

When using the double run one of the yards should always contain a good crop of grass or growing grain to provide fresh green food for the confined birds. One of the runs can be sown to oats in the spring and when the crop is about six inches high the birds can be turned upon it to feed. Then the other yard which has been closely cropped by the hungry flock can be ploughed and sown to oats.

When the growth in the second yard has been nearly consumed, the flock can be turned back into the first yard and the second can be sown to millet. In this way the ground is kept free from disease and the chickens are insured the plentiful supply of green food which is impossible when they are confined in the same run during the entire season. The following outline plan has been used with success:

	Yard 1	Yard 2
Early spring	Chickens	Sow oats
When oats are 6" high	Oats	Chickens
When second crop oats is ready,	Chickens	Millet
Autum	Barley	Chickens
Late fall	Chickens	Rye

At the opening of the spring season the chickens are turned into the yard that was planted last in the fall and oats are sown in the other yard. The rotation is then continued as indicated in the above plan. In this way the flock is given plenty of green food and the forage crop furnishes some shade at the same time.

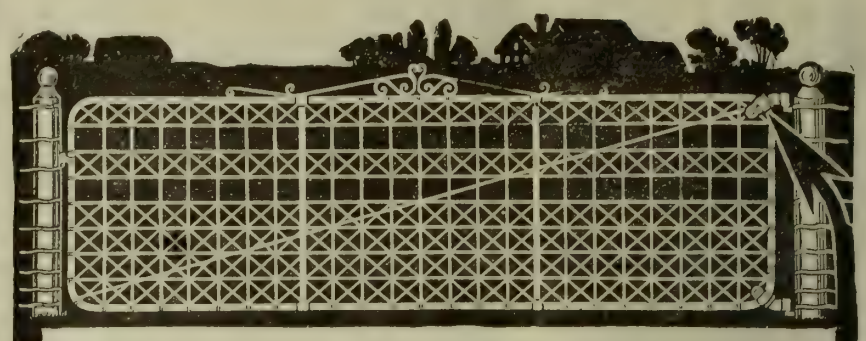
Evergreens to Break the Winter Winds.

Indian corn and the castor bean are valuable plants for the poultry yard and evergreen trees make excellent windbreaks and furnish cool shade in the summer. The evergreen should not be planted too close to the buildings however, as they keep the sun away during the winter. Deciduous trees drop their leaves in winter and not only furnish shade, but allow the sun to shine in the buildings.

Even when the flock is allowed the freedom of the farm and the barns, it is advisable to have shady plantings where the birds can seek protection in hot weather. On large poultry farms it is absolutely necessary to confine the birds, especially if the farmer is raising fancy stock. It is then that the shady yard becomes doubly necessary to keep the flock in prime condition and the farmer who quarters his flock in clean shady yards will be well repaid with the increased production of eggs and the improved vigor of the flock.

The Improved "Ideal" Farm and Stock Gates

Made in Canada By Canadians For Canadians



ONE look at this IDEAL Gate is sufficient to convince anyone of the superiority of IDEAL Gates over any other make.

Improved IDEAL Gates are without exception the best and most complete gates, combining as it were all the most modern improvements with proficiency.

IMPROVED "IDEAL" Gates do not cost more than any ordinary common Gate.

Note the **position** of the **hinge clips** at the **corner bends** instead of on the back of the gate. This improvement provides the greatest resistance ever required and ensures perfect control—especially on long gates—and it also prevents the back part of the gate from breaking or bending.

THE IMPROVED "IDEAL" FARM AND STOCK GATES EQUIPPED WITH A BRACE TIGHTENER ATTACHED TO THE TOP HINGE CLIP.

Notice how the end of the brace wire is inserted in a hole in the ratchet wheel of the brace tightener (see illustration), enabling you to tighten or replace the brace wire in less than two minutes with a wrench, when you have practically a new gate without any extra cost.

In all Ideal Gates, we still maintain the same high quality of material, workmanship and finish that has made Ideal Gates so popular.

Remember that the Improved IDEAL Farm and Stock Gates have features that no other gates sold in Canada possess.

They are worth twice the price of an ordinary gate but WILL NOT COST YOU ANY MORE, IF AS MUCH.

Ask for Complete Catalogue 66, which will be mailed to you immediately.

Difficulty in Raising Squabs.

I have a few fine pigeons and while they seem to be ferfectly healthy and in good condition, my difficulty is with the squabs. My birds are good producers, but when the squabs are about 10 days to two weeks old they die, and so far I have been unable to ascertain the cause. I have been feeding a mixed feed containing cracked corn, wheat, peas, kafir corn and other seeds. I also keep them supplied with ground oyster shell, gravel, etc. Their coop is always kept a sclean and free from vermin as possible, while good clean water is always kept before thew.—W. A. Graber.

The care and feed is all right, except the wheat. Red wheat is the only kind fit for pigeons.

You do not state whether you feed salt or not. In case you have not been feeding salt it is undoubtedly the reason why the youngs birds die. It is impossible to raise pigeons unless they have access to salt at all times, either in the shape of fine salt kept in a box, or rock salt kept wet every day. They should also have charcoal, gravel and oyster shell.

If the pigeons have been fed salt, then the cause of the young birds dying is the way in which they have been fed, rather than the feed given. There are two ways of feeding pigeons, feeding by hopper or by hand twice a day, all the birds will eat up clean. Be sure they have plenty to eat, but that none is left on the ground.

Hand feeding I consider the proper way, but many prefer hopper feeding. The only trouble with hopper feeding is where a number of grains are fed, the birds will pick out only the kind they like. Consequently they do not eat enough themselves and the young birds are not properly nourished. Although the old birds have plenty before them it is not utilized. If the hopper method is used, I would advise feeding equal parts of corn, peas and buckwheat.—T. Edward Cordis.

Feediag Young Chicks

The young chicks may be fed any time after they are 36 to 48 hours old, whether they are with a hen or in a brooder. The first feed may contain either hard-boiled eggs, johnnycake, stale bread, pinhead oatmeal, or rolled oats, which feeds or combinations may be used with good results.

Don't Limit the Beauties of Your Flower Garden

by thoughtless seed buying! Choose the varieties with an eye to the possibilities of your own particular space and location—but be even more careful to get

Ewing's Reliable Seeds

Then you can be quite sure that the seeds will germinate and grow—that the plants will be strong and healthy—and that the bloom will be abundant and beautiful.

Berwick, Nova Scotia.

IF YOU HAVE LIVE STOCK FOR SALE ADVERTISE IN THE MARITIME FARMER.

Mashes mixed with milk are of considerable value in giving the chickens a good start in life, but the mixtures should be fed in a crumbly mass and not in a sloppy condition. After the chickens are two months old they may be fed four times daily, and after three months old three times daily, with good results.

A Good Recipe for Johnnycake.

Johnnycake composed of the following ingredients in the proportions named is a very good feed for young chicks: One dozen infertile eggs or one pound of sifted beef scrap to 10 pounds of cornmeal; add enough milk to make a pasty mash, and one tablespoon of baking soda.

Dry bread crumbs may be mixed with hard-boiled eggs, making about one-fourth of the mixture eggs, or rolled oats may be used in place of the bread crumbs.

Feed the bread crumbs, rolled oats, or johnnycake mixtures five times daily for the first week, then gradually substitute for one or two feeds of the mixture finely cracked grains of equal parts by weight of cracken wheat, finely cracked corn, and pinhead oatmeal or hulled oats, to which about 5% of cracked peas or broken rice and 2% of charcoal, millet or rape seed may be added. A commercial chick feed may be substituted if desired. The above ration can be fed until the chicks are two weeks old, when they should be placed on grain and a dry or wet mash mixture.

A Good Growing Mash.

After the chicks are 10 days old a good growing mash, composed of two parts by weight of bran, two parts middlings, one part cornmeal, one part low-grade wheat flour or red-dog flour, and 10% sifted beef scrap, may be placed in a hopper and left before them at all times. The mash may be fed either wet or dry; if wet, only enough moisture (either milk or water) should be added to make the feed crumbly, but in no sense sloppy. When this growing mash or mixture is not used a hopper containing bran should be accessible to the chickens at all times.

When one has only a few chickens it is less trouble to purchase the prepared chick feeds, but where a considerable number are reared it is sometimes cheaper to buy the finely cracked grains and mix them together. Many chick feeds contain a large quantity of grit and may contain grains of poor quality, so that they should be carefully examined and the quality guaranteed before they are purchased.

Treating White Diarrhea

The experience of Edward S. Parsons of New York, a practical poultry keeper, with bacillary white diarrhea, differs from the opinions expressed by the doctors who have studied this disease. Through the use of sour skim milk Mr. Parsons claims to have not only stopped the disease, but proved that milk-fed chickens can be raised successfully, whereas the untreated ones die.

It was in May, 1913, that Mr. Parsons took the care of a large poultry farm. Young chick were dying by hundreds, and the doctors who were called in advised that the only way to get rid of the disease was to test all breeding stock and use eggs from only the healthy hens, or clean out the plant and start anew.

Feed Sour Skim Milk.

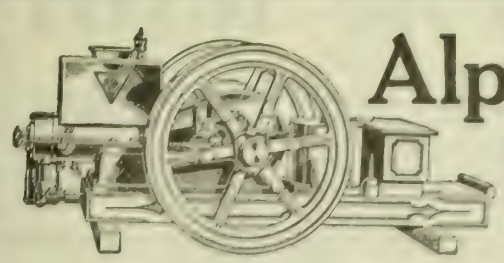
Knowing that sour skim milk was a splendid food for both chicks and fowls, Mr. Parsons decided to try it. He used a commercial starter of 6 to 7% lactic acid on account of the higher per cent of acid. The incubators were darkened when the eggs hatched so the chicks would not pick up egg shells or droppings from others, and thus spread the disease.

The chicks were removed from the incubator as soon as dry and given a pen dropperful of sour milk. Mr. Parsons thinks it necessary to give a large dose so early in the life of the chick to fill as far as possible the intestinal tract with lactic acid. This will prevent the germs of white diarrhea from getting a start.

The chicks were placed in the brooders, but not fed for 36 hours. They were given water to drink to which permanganate of potash was added. As soon as they learned to drink, which is in two or three days, they were given sour skim milk.

Although the breeding stock was supposed to be quite badly infected with the germs of white diarrhea, Mr. Parsons mated up the breeding pens early in the winter of 1913. The hens were given plenty of sour skim milk to drink, and were otherwise well cared

No case of white diarrhea developed last season in more than 4500 chicks which were hatched. The total loss of young chicks was less than 3% from all causes, although the year previous it ran up to 60 and 70%, and in some cases 100% before sour skim milk was used.



Alpha Gas Engine

This engine will pay for itself quickest

BECAUSE of its low fuel cost and exceptional freedom from expensive repairs, the Alpha will pay for itself on your farm in the shortest time. You will get greater and quicker returns for the money invested.

You may be able to buy an engine for less money than you can an Alpha, but that should not be your chief consideration in selecting an engine. You should always keep in mind the service you will get from the engine. No other engine will give you as much for as little money as the Alpha.

The Alpha is a simple engine with plenty of power, perfectly controlled by a most sensitive governor, that keeps it running steadily and smoothly under light, heavy or varying loads. The fuel consumption is accurately gauged to the load so that there is no waste.

This engine has no complicated, delicate parts to require constant attention—not even batteries. It starts and operates on a simple low speed magneto. You can use either kerosene or gasoline for fuel and the minimum amount of either will be required.

There is a great deal of work on your farm that can be done better and cheaper by using an engine. You can save enough to pay for the engine in a very short time. The quickest way to save the money that will pay for your engine is to buy an Alpha now, and put it to work.

Ask for a copy of the Alpha Engine catalogue. It contains a lot of valuable information about gas engines. Alpha Engines are made in eleven sizes—2 to 28 H. P.—each furnished in stationary, semi-portable, or portable style with hopper or tank cool cylinder.

MONTREAL PETERBORO WINNIPEG VANCOUVER

Why Turkeys are Delicate.

The majority of turkey breeders make a grave mistake in mating together birds that are too young. A fact that does not seem to be commonly known—or, if konwn, ignored—is that turkeys do not attain full maturity till they are three years old, and thus yearling cocks and hens should not be mated together. If pullets are used, they should be served by a two, or, preferably, a three-year-old cock, and vice versa.

Only in this manner will strong, healthy chickens be produced, those possessing a sound constitution and an abundance of vigor; while, on the other hand, if immature stock be employed, the offspring will probably be delicate, and a considerable amount of difficulty will be experienced in rearing them successfully.—Edward T. Brown, England.

Ridding Yards of the Capeworm.

If your chicks or poults were troubled with gapes last season energetic methods should be employed before chicks are hatched to rid the infested trouble. Spread a coating of slaked lime over the entire poultry yard and do not disturb it for a month, which will give the rains a chance to soak it through the soil.

Before allowing chicks on the ground, the soil should be ploughed and planted to oats or some other crop. Perhaps the best way to prevent gapes is to move the house and yards where chicks are raised, to a new location each year and cultivate the infested ground for a year or two.—T. Z. Richey.

The Worth of a Wife.

By Leslie Childs.

"Don't you want to go to church this morning, Myro?" called Mort Bradley, from the side gate, to his wife as she stood in the doorway. "No, I don't think so, Mort," she replied, "I don't hardly feel able," and she returned into the kitchen. He noticed how tired and worn she looked, but it was such a beautiful morning he wondered it did not tempt her. "I'll go down to the barn and do the feeding, and maybe you'll feel like going when I get back," he called and then walked moodily in the direction of the outbuildings.

Mort Bradley was worried about his wife. As he crossed the lot between the house and barn, his eyes roamed listlessly over one of the finest farms in the county. It was well fenced, well tended, with choice stock in every pasture, in fact here was everything to gladden the heart of a true son of the soil. But as he passed on he did not see these things, for he was thinking of a certain June morning three years before, when he and his wife had stood together under a bower of roses.

He thought of the congratulations of his friends, and the seemingly sure prospect for a happy life. And it was beginning to wane. In the three years he had been successful beyond his greatest hopes. His crops had been good, he had stocked the farm, had bought everything in the market in the way of improved machinery, and had even then placed money in the bank.

But in that time a great change had come over his wife. The piano stood in the corner, untouched, except when they had compnay, or he requested her to play. She spent most of her time in the kitchen. Of an evening she wasn't much company for him, she usually did some sewing, then went to bed. Mort couldn't understand it. She never felt like going anywhere, and if she did, he began to notice how unfavorable she compared with her former girl friends.

Mort went to church alone that Sunday morning, and on the way back passed George Merton's place. George was what some people called a "paper farmer," but he had made a success of farming; that no one denied. "Come over and have a chat," he called from the front porch as Mort drew rein. Mrs. Merton now came out and welcomed him. She and George had been married five years, and she looked as young and girl-like, as the day the ceremony was performed.

"Come in and have dinner with us," she gushed, "and why didn't you bring Myra along?" she continued. She and Myra had been school-girl friends, but since their marriage had not seen much of each other. Myra had little at a time dropped out of her old circle of friends, while Mrs. Merton had continued the friendships of her younger days.

Mort went in, and as he and George sat talking he glanced into the kitchen where Mrs. Merton was getting dinner. She fluttered around the room, with a song on her lips, as though she really enjoyed getting a meal. Mort noticed she didn't have to run out to the cistern every time she needed a little water, there was a sink and little pump in the kitchen. He saw a fireless cooker, a separator, and a dozen other labor-saving machines. The sight of these improvements set him to thinking.

"Good gracious, George," he exclaimed, as he waved his hand in the direction of the little, pump and sink, "how do you ever afford to put all such jimcracks in the kitchen? Must cost a pile of money." George laughed. "Yes," he admitted, "they cost money, but they pay for themselves a hundred times over in the course of a year. I don't see how I could get along without them. Now, that sink and pump there, I guess that saves my wife about a hundred trips to the yard in the course of a day. So figured on the cost of labor saved it is as good an investment as the binder." "But she has all day to do the work in," objected Mort. "Yes, that's true," agreed George, "but it makes a great difference to me in the evening. When I come home I want some one here that will be a comfort and a companion to me. If my wife chased around all day dumping dish water, and carrying loads that might just as well be dumped through a hole, and carried by machinery, she won't feel much like entertaining me in the evening.

"Then there's another way of looking at it. Wives are very expensive things to have around. It costs like the dickens to get a good one, and you run so many risks besides. So I figure when a man has one that suits him he ought to make her last as long as possible." "George, you brute," laughed his dife from the kitchen door, as she shook the dish rag at him.

"Yes," continued George, "I think a husband should give his wife free rein in the kitchen, that is, if she is up-to-date, and can think of and suggest improvements. If not he ought to see to it himself, and insist that everything modern should be installed. For if the culinary department on a farm doesn't show a profit in pleasant evenings and social intercourse, there's something wrong And the farmer is either heading for the divorce court as defendant, or to the graveyard as chief mourner. In ther case he's going to be the loser."

As Mort drove home that noon he pondered long on what George Merton had said. He had never looked at things from that viewpoint. He had always looked at money spent in the kitchen as just that much waste, in so far as an actual return could be expected. He wondered if his friend was right, and he determined to carry on some investigations, on his own account, that would at least give him an idea of the labor-saving value of these modern kitchen improvements.

The next morning after feeding he returned to the house, and placing a chair in the doorway seated himself. He sat in a position that would enable him to watch every movement his wife took. "Why, what's the matter?" she asked in a tired sort of way, aren't you gonig to work this morning?" "No," he replied, "I thought I'd take a little time off this morning. I'm expecting a man out here on business. and I don't want to miss him," he lied as he saw the surprised look on his wife's face. He maintained his seat in the doorway until noon, despite his wife's wonder and questions.

When he resumed his seat after dinner, she became alarmed. It was the first time Mort had ever loafed around the house since they were married. It wasn't like him. "Why' Mort, what in the world is the mtater with you? Are you sick?" she inquired with much concern. Laughingly he assured her that he was perfectly well. But that evening, when she saw him take a tape and measure the distance from the kitchen to the cistern, she thought he was surely losing his mind. To her rather insistent questioning he only smiled, and that evening sat before the fire doing sums in arithmetic.

The next morning at the breakfast table he turned to her and said: "Myra, I think you'd better go over to your mother's house for a day's rest today." "Why, Mort," she replied in astonishment, "I can't possibly go to-day. Who would get your dinner? And there is so much work that I must do this morning; why, I couldn't think of going at this time." "No," he answered, "you don't need to think of going. In five minutes I'll be up here with the horse and buggy. and all you need do is climb in."

He was as good as his word. He bundled her in the buggy, and almost forcibly took her visiting. When he returned he used the telephone, and before dinner had two workmen from town at the house. They brought material for putting in a sink and took measurements for a number of other improvements.

That evening when Myra returned home she almost fainted in surprise when she saw the change. "Oh, Mort," she cried, "I now know what you were doing yesterday, and why you wanted me to go away to-day. You old dear. I've always wanted a sink and pump, but was afraid to ask for it, for fear that you would think they cost too much."

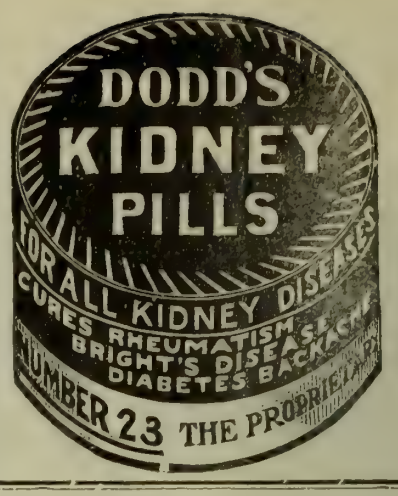
"Yes, dear," he returned. "I've been blind for the past three years. I've been thinking too much in dollars and cents. I've been letting you work yourself to skin and bone, all for the sake of a few pennies. Yesterday I kept account of the trips you made to the cistern, and it totalled up almost a mile you had walked. The little improvement that we put in to-day will save you all of that." He looked into his wife's eyes, and she was actually smiling in the old way.

"Yes. you're going to have everything you want for the kitchen from now on, so you can start thinking up things. I'm at least going to take as much care of you as I do the horses." With a little cry she flew to his arms.

That evening Myra played on the piano and didn't wait for him to ask her either. And in the days that followed, as he heard her singing at her work, he felt he was reaping interest at a thousand per cent. on the investment he had made.

BETTER THAN SPANKING

Spanking does not cure children of bedwetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W. 309, Windsor, Ont., will send free to any mother her successful home treatment, with full instructions. Send no money but write her to-day if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.



Colds---How to Contract and How to Avoid

A cold is a serious thing; it is not due to exposure; we rarely get entirely well of it, and we do not "catch" it. The common, everyday "cold," of which we have all had our share, has been regarded as an evil to be endured, rather than avoided or cured

Colds are now known to be due to a germ. When we get a cold it means that the cold microbes have gotten into our nose and throat and have found a suitable place in which to grow and multiply in the mucus which is given off by these tissues. When our body is in prime physical condition this mucus covering of the nasal membranes does not afford the germs a suitable food and harbor for development. In other words, the normally resistant membranes of the nose and throat have the power to destroy these, and other kinds of germs, before they acquire a foothold within the deeper tissues. This resistance is well demonstrated by the trifling little sniffling colds, which we all have experienced, that disappear within a few hours.

Whether the cold germs are carried about by the winds or are distributed only by coughing, sneezing and spitting of those already infected, has not yet been fully determined. But the germs are abundant in every com-

ELDERLY WOMEN SAFEGUARDED

Tell Others How They Were Carried Safely Through Change of Life.

Durand, Wis.—"I am the mother of fourteen children and I owe my life to Lydia E. Pinkham's Vegetable Compound. When I was 45 and had the Change of Life, a friend recommended it and it gave me such relief from my bad feelings that I took several bottles. I am now well and healthy and recommend your Compound to other ladies." —Mrs. MARY RIDGWAY, Durand, Wis.

A Massachusetts Woman Writes:

Blackstone, Mass. — "My troubles were from my age, and I felt awfully sick for three years. I had hot flashes often and frequently suffered from pains. I took Lydia E. Pinkham's Vegetable Compound and now am well." —Mrs. PIERRE COURNOYER, Box 239, Blackstone, Mass.

Such warning symptoms as sense of suffocation, hot flashes, headaches, backaches, dread of impending evil, timidity, sounds in the ears, palpitation of the heart, sparks before the eyes, irregularities, constipation, variable appetite, weakness and dizziness, should be heeded by middle-aged women. Lydia E. Pinkham's Vegetable Compound has carried many women safely through this crisis.

munity, and the infection appears to be distributed everywhere.

Exposure is not the cause of "catching cold." Many people get colds while indoors, attending public meetings, and in overheated houses; while the multitudes, often very poorly clad are out in all sorts of weather with impunity, and yet do not take cold. The trench warfare of Europe has disproved beyond doubt the theory of colds being due to wet and exposure to bad weather alone.

Exposure, used in the sense of being out in bad weather, need not result in "catching cold." Nor does being exposed, along with the presence of the cold germs, always end in a cold. It is a dangerous combination, but to get a cold requires one thing more: the body must lack resistance; the body functions must be imparied; the organs and glands must lack in activity, and the system be overcharged with body poisons which destroy the protective balance of the vasomotor nervous system.

Because of this disturbance of the nerves, and with it a disturbance of the circulation, there will result a derangement of the heat formation in the body. The control of the body temperature has much to do with protecting the delicate membranes of the air passages from "catching cold." The heating plant of the body is automatic in its action, just as the beating of the heart. When we breathe cold air, more blood must be sent into the nasal membranes to warm the tissues and prevent a chilling of the air passages. If this central nervouse system is free to operate, the body warmth will be equalized perfectly. When the body organs are stagnant the central nervous system becomes poisoned, and for this reason fails to meet the necessary demands. When the membranes of the nose call for assistance when we are breathing cold air the poisoned nerves do not deliver the message. The reinforcement of rich, warm blood does not arrive, and then the cold germs "dig in," setting up inflammatory changes, and sutffing up the nose. Then you have "caught a cold." The body was lacking in resistance.

Colds may rapidly become serious. The inflammation caused by colds may extend along the many ducts leading the throat into the tonsils and lungs. Rarely do we recover from a cold without permanent injury. Usually no serious damage is done by any one attack, but frequently repeated colds soon develop into chronic nasal catarrh, enlarged tonsils, quinsy, deafness, noises in the ears, throat and lung trouble, and many chronic conditions.

A stuffed-up, weeping nose has heretofore been a joke, rather than a cause for alarm. In the long ago a treatment for colds of the head was "to hang one's hat on the bed post and to drink whisky and water until you saw two hats." In more recent times it was quinine and nauseous teas, with close confinement in an overheated living room, where the whole family was obliged to swelter during the evenings. A n open window, or the least bit of fresh air, was thought to be sure to drive the trouble down into the lungs, with the danger of pneumonia and consumption.

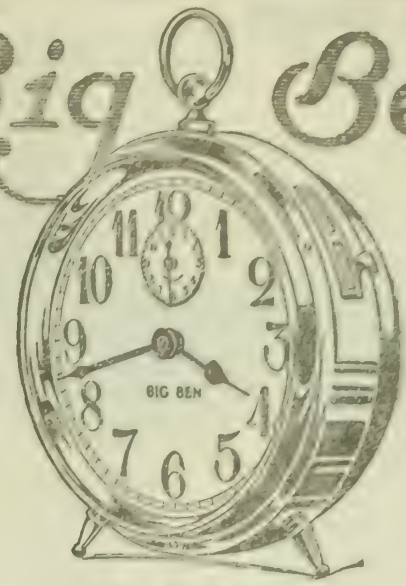
We are learning that the best treatment for the ordinary cold of the head is to supply the system with nourishing, easily digested food, and an abundance of fresh air, at the same time cleansing the nose and throat with mild washes, and the gastro-intestinal tract with active purges. In colds of the throat and chest this fresh-air treatment is also advisable. making sure that the body is well protected from the chilling winds, and the feet kept warm and dry.

Colds frequently are due to dusts of many kinds, nasal deformities, and irritating fumes. Threshers. millers, and others working in dust, are apt to suffer from congestion of the nasal membranes, making it easy for the cold germs to gain a foothold. To this class also belong the many kinds of hay fever.

Therefore "catching cold" is not due to any one thing. The cold germs, mechanical irritation, poor ventilation, exposure, derangement of the stomach, and a body hypercharged with wastes all may contribute a share.

Colds are dangerous in that they may lead to more serious things. Because colds are a germ disease it is not always possible to avoid being infected. Since a multitude of conditions predispose to "catching cold," it is necessary to keep the secretions of the nasal membranes resistant by preserving the best possible state of health. To do this we must maintain a high standard of perosnal hygiene. And of this I will tell you in my next paper.—Julian Clarke, M.D.

Big Ben



100,000 Farms run on his Schedule

Put *your* early rising problems in Big Ben's hands — just tell him what time in the morning you want to get things stirring around your place.

He's *calling* time and *keeping* time now for five million families—more than a hundred thousand of them live on farms.

See Big Ben today at your dealer's. 7 inches tall, handsome, built to last for years. Rings two ways once for five straight minutes, or at half-minute intervals for ten minutes, unless you shut him off. Price $2.50 in the States, $3.00 in Canada.

If your dealer hasn't him, send a money order to his makers and he'll come direct by parcel post, all charges prepaid.

His Face Was Covered With Pimples.

Pimples are not a serious trouble, but they are very unsightly.

Pimples are caused wholly by bad blood, and to get rid of them it is necessary to purify the blood of all its impurities.

Burdock Blood Bitters has made many remarkable cures; the pimples have all disappeared, and a bright, clean, complexion left behind.

Mr. Lennox D. Cooke, Indian Path, N.S., writes: "I am writing you a few lines to tell you what Burdock Blood Bitters has done for me. Last winter my face was covered with pimples. I tried different kinds of medicine, and all seemed to fail. I was one day to a friend's house, and there they advised me to use B.B.B., so I purchased two bottles, and before I had them taken I found I was getting better. I got two more, and when they were finished I was completely cured. I find it is a great blood purifier, and I recommend it to all."

Burdock Blood Bitters has been on the market for the past forty years, and is manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

Last Year's Opportunities.

Are gone, you can't go back and pick them up. Your premier opportunity may come to you next January. Will you be there ready to meet it, or will you let it slip by to be picked up by your competitor because you are not prepared? If you started right now to study Booking, Stenography, Banking, etc.' Today is the most important day in your career, because your decision of today determines your success a year from today. Mother Hubbard's Ironing Day

Today has been Tuesday. The sun rose early and so did I; both of us bright and active with the desire to get a lot done. The old sun was busy with the harvest but my energies were directed towards a large basket of fresh dried clothes from yesterday's wash. Homely things are clean clothes, yet we cannot be happy without them and lots of them. Did you ever stop to think how we women spend about half our time keeping things clean? Clean dishes, clean floors, clean clothes clean food, clean children and clean selves; and since "cleanliness is next to godliness," we may rejoice that our lot, our work is cleanliness. You know the old soldier's motto in one of Kipling's poems:

"Shoot straight, keep clean,
Love God, and serve the Queen."

(written in the reign of Queen Victoria). Well, if that is the whole duty of a soldier a housewife might be made to say:

"Cook well, keep clean,
Serve God and love the King,"

and it would keep her fairly busy to live up to it.

I didn't stop to say all this to the clothes basket when I say it so early this mornin. No; I grasped its two handles and "started action." A bundle of freshly dried clothes always appeals to me, so sweet and new they seem. They seemed to me this morning like a basket of new opportunities. So we greet every morning if we could but see it. Each day we start anew. The night has washed from our minds the stains of yesterday and the rising sun hands us a new day and its basket of new opportunities to do all sorts of things.

I began to sort the clothes to sprinkle them. That should have been done yesterday but I couldn't do it yesterday, so I was at it now. I guess every housewife consciously and unconsciously sorts out her labors as I did the clothes, what is not needed, first; what must be done, next; the careful things to be done when one has more time and the "don't matters" to be hurried over.

Marion's Methods.

I knew a student that was head of her class and yet never seemed to kill herself with work, and I said to her one day, "Marion, however do you accomplish so much and so easily?" And I have never forgotten Marion's answer, because it fits all sorts of work as well as study: "When I sit down," said Marion, "to face my work, I strike for essentials, and I say to myself, What's the main point in this thing? What counts most? and I do that first and thoroughly. Then I look at my clock and try and accomplish the rest of my task in an exact given time. I find the main thing is to pick out the essentials quickly—then my work is ordered and worth while."

How do you think Marion would apply her theory to the ironing? I imagine I her her say, "I'll put six hours on that ironing — three this morning and three this afternoon. Ironing clothes is a vanity of life We iron things to make them look better or feel better. It is a glory of the eyesight for ourselves and others. That being so, the things that show most are the essentials, the fine white starch and the table linen, so I'll put the most time on them." And I guarantee she'd be done in the six hours, no matter how huge the ironing.

"Preparedness."

"My I wish I could have sprinkled these things yesterday," I kept saying to myself. "Isn't that the way with most things in life. We haven't prepared to do them till they jump into us and cry, 'Do now, wether you're prepared or not.' Alas! why aren't we prepared.

Barrett
Made in Canada

Money Savers for Farmers

Seven short appeals to "horse sense"

ANY man can make money by judicious saving. "A penny saved is a penny earned." Think it over. There are certain things you ought to have for farm maintenance. But don't buy the wrong thing at any price or the right thing at the wrong price. Perhaps right now you are in need of a timber preservative, a lice or fly killer, a durable paint for metal and exposed wood surfaces, a satisfactory cement for quick everyday repairs, a ready roofing that is wear-proof, easy to lay and cheap.

We can fit you out perfectly in these things. The Barrett Money Savers have no superiors. Just glance over the products shown below:

ARE you getting all you should from your live stock? Perhaps they are being pestered by insects—flies, lice, vermin. They must be kept clean. Spray your cows and horses with Creonoid. Keep them from insect annoyance. And your hogs will be better if the rubbing posts and swill pails are Creonized. A boon in the poultry house—better hens—more eggs. Creonoid comes in cans of 1, 5 or 10 gallons or in half barrels and barrels. And it's the most economical you can buy. Follow directions carefully.

DO your implements rust? If so, they are decreasing in value. Coat your implements and iron work with Everjet Elastic Paint. You know that carbon paint is best for such purposes. Well, Everjet is the best carbon paint made. Never cracks or peels. Wears like iron. Has a large covering capacity and is extremely economical. Has no equal as a roof paint.

YOU will be glad for the day when you met Everlastic Roofing. Just the thing for all farm buildings. The best "Rubber Roofing" at the price. And the price is low. No excuse for a leak in your roof with Everlastic at your service. It is tough, durable and easy to lay.

EVERLASTIC ROOFING

CARBONOL is a household wonder. It cleans, heals, disinfects, purifies. If you cut your hand, apply Carbonol in weakened solution. If your live stock get bruised, Carbonol will fix them up. If your house, barn or poultry house needs disinfecting, there is nothing like Carbonol. And it is wonderfully effective as a destroyer of vermin. Carbonol belongs on every farm in Canada.

HERE is a ready roofing that needs no painting or other attention to keep it watertight. Amatite Roofing has a mineral surface that laughs at wind and weather. Very attractive because of its bright sparkling appearance. Wherever you have steep roofs, you need Amatite. Amatite is made in rolls of 110 square feet with galvanized nails and cement in center. Try it!

HERE is a product you should never be without—Barrett's Grade One Creosote Oil. It is the most effective wood preservative on the market. Actual tests have proved that it penetrates deeper and lasts longer than any similar product. A good fence post will last 20 years if painted with Barrett's Grade One Creosote Oil. Use Grade One Creosote Oil and add to the life of all your exposed woodwork.

Barrett's Grade One Liquid Creosote Oil

HERE is the way to make everyday repairs quickly, permanently and cheaply—use Elastigum, the adhesive, elastic and waterproof cement. Whenever you have gutters to join or reline, leaks or joints to seal, cornices to stuff, greenhouse glasses to put in or chimney flashings to renew, Elastigum will be your unfailing friend. Cheap, easy to use and always on the job.

Send for illustrated booklet describing Barrett Money Savers in detail. Address nearest office. For sale by good dealers everywhere.

ST. JOHN, N. B. HALIFAX, N. S. SYDNEY, N. S.

There was a very precise Englishman to whom I was talking one day who is a splendid driver of his automobile. He had never had an accident. I was talking to him one day and he showed me a small red notebook he carried. "The way I do," he explained, "is to plan ahead what I would do in every emergency I can think of. I write them down and then think out what to do and write it down in three words if possible and carefully memorize those words. I say them over and over to myself, then when the thing happens I do it somehow without thinking. For instance, last week we would all have been killed but for this." He showed me a line which read "Turn into hill." "That saved us," he continued. "We were coming down that side of the mountain over there when something broke so that I couldn't stop the machine. I could see that corner ahead and heard the toot of another machine coming up. I was afraid we'd

HOMESEEKER'S EXCURSION Via CANADIAN GOVERNMENT RAILWAYS.

Excursion tickets to points in Manitoba and the Canadian North West will be sold at reduced rates, good going every Wednesday from now until October 25th. The fare from St. John to Winnipeg is $55.00, Regina $58.75, Saskatoon $59.75, Calgary $63.00, Edmonton $63.00. The return limit is two months from date of issue.

Proportionately low fares from all stations in the Maritime Provinces to the above and other points in the North West. Full particulars can be obtained from any ticket agent of the Canadian Givernment Railways.

Holders of these tickets have the privilege of travelling by the new Transcontinental route via Toronto, North Bay and Cochrane, Ont., to Winnipeg.

go over the precipice, the road is so narrow at the turn, and I remembered this 'Turn into the hill.' So I did. It upset the machine sideways and gave us a bad shakeup, but we were all safe and no bones broken. The other party came round the curve just as we upset. My, it was a close shave!"

Every household should have a book "What to do in Emergencies," such as, In case of fire? In case of a broken leg? If baby swallowed poison? There are a hundred and one such things likely to happen to us and when they do happen we are so frightened we can't think what to do, while if we had our note book "Prepare to meet Emergencies," we'd do the thing before we knew it.

Just there in my meditations I saw it was time for the breakfast, which was duly accomplished, and the family sent off to its work and school, the place was tided again and I got out my ironing blanket.

One Way of Ironing.

Of course I did really get at the ironing. First of all I always run off the things that don't count, the dusters, rags, and stockings. "Poor relations," mother always called them—the last in the wash and the first in the iron. "Hustle them along and be done with them—they don't count." But I hope that isn't the way we treat our poor relations really for they are human beings and ought to count as much as anybody.

Then comes the sheets and the underclothes which we may call "the things out of sight." Since they are clean we won't say whether they are much polished or not. It is well if all things out of sight are the same. If our thoughts of things are pure and clean it doesn't matter so much if they're polished with education or not. Then come the things that take time and gratify our sense of the beautiful. We will enjoy these. There is a line to draw in our lives between the things we do to make life beautiful and the things we do because our neighbor is going to see it and talk about it. Keep high ideals in our work. To seek beauty is well, but our neighbors' good opinion is often not worth the strength and time it takes to get it.

A Child's Sense of Justice.

Just here my little five-year-old daughter came in. "Mamma, Mary had an orange to take to school; may I have one? I saw this involved not only the orange which she loved very much but the sense of the justice of equal gifts. It's hard always to give the same gifts to each child, but it must be done. A child's sense of equality and justice is so keen that we would injure that child morally if we did not live up to the high level of their faith in us, so Alice got the orange as well as Mary. Likewise my other two little ones. Four is a long list to go round. I am reminded of the story of the poor woman who had seven children, a keen sense of justice, and eleven and a half apples to divide between them. She was no mathematician but she divided those apples equally among the children. "How did she do it?" you ask. Why, she made apple sauce.

Young Men's Opinions.

This is a very cosmopolitan age and generally speaking there are no class distinctions. I was walking home the other afternoon when a young gentleman I know came up to me and we came along together and I was amused and amazed at his delicate distinctions in accosting the young ladies we met. "Hello there," he said to the saucy wave of a hand. "How do you do, Miss L?" to a quiet-looking girl. "Au revoir," to another. "Good afternoon,"

(Continued on Page 434.)

Take the Load Off the Centre

We needed an extra strong wagon to sell in Eastern Canada, and we went to the wagon designer with our needs. He said, "If your customers will stand for something new, I can give them a wagon they'll have hard work to beat. I'll change the design of the skein and take the weight of the load off the center of the axles." We said, "Go ahead," and the **Chatham** giant end-bearing skein is the result.

With this skein the load is carried at the end of the axle, close to the points of support made by the wheels. A steel truss under the axle, firmly clipped to the skein at each end, completes the design of this strong Canadian wagon gear.

Chatham wagons are made in all the styles used in Eastern Canada so that you can get just the wagon required for your work. Write us for folders giving full particulars of the material and construction of the wagons, trucks and carts sold by our local agents in Eastern Canada.

SISTER: READ MY FREE OFFER.

I am a woman.
I know a woman's trials.
I know her need of sympathy and help.

If you, my sister, are unhappy because of ill-health, and feel unfit for household duties, social pleasures, or daily employment, write and tell me just how you suffer, and ask for my **free** ten days' **trial of a home treatment** suited to your needs; with references to Canadian ladies who gladly tell how they have regained health, strength, and happiness by its use. I want to tell you all about this successful method of home treatment for yourself, my reader, for your daughter, your sister, or your mother. I want to tell you how to cure yourselves at home at trifling cost, and without aid from anyone. Men **cannot** understand women's sufferings; what we women know **from experience**, we know better than any doctor; and thousands have proved there is **hope** even **for the hopeless** in my method of home treatment. If you suffer from **pain in the head, back, or bowels, feeling of weight and dragging down sensations, falling or displacement of internal organs, bladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly or irregularly, bloating or unnatural enlargements, catarrhal conditions, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living, I invite you** to send to-day for my complete **ten days' treatment** entirely **free and postpaid**, to prove to yourself that these ailments can be easily and surely conquered at your own home, without the expense of hospital treatment, or the dangers of an operation. Women everywhere are escaping the surgeon's knife by knowing of my simple method of home treatment, and **when you are cured**, my sister, I shall only ask you to pass the good word along to some other sufferer. My home treatment is for all.—**young or old.** To **Mothers of Daughters**, I will explain a simple home treatment which speedily and effectually cures green-sickness (chlorosis), irregularities, headaches, and lassitude in young women, and restores them to plumpness and health. Tell me if you are worried about your daughter. Remember **it costs you nothing** to give my method of home treatment a complete ten day's trial, and if you wish to continue, it costs only a few cents a week to do so, and it does not interfere with one's daily work. **Is health worth asking for?** Then accept my generous offer, **write for the free treatment** suited to your needs, and I will send it in plain wrapper by return mail. To save time you can cut out this offer, mark the places that tell your feelings, and return to me. **Write and ask** for the **free treatment to-day**, as you may not see this offer again. Address:

RED ROSE TEA "is good tea"

Suffered Awfully

FROM

BILIOUS HEADACHES.

When the liver becomes sluggish and inactive the bowels become constipated, the tongue becomes coated, the stomach foul and bilious headaches are the upshot.

Milburn's Laxa-Liver Pills will stimulate the sluggish liver, clean the foul-coated tongue, do away with the stomach gases and banish the disagreeable bilious headaches.

Mrs. J. C. Kidd, Sperling, B.C., writes: "I have used Milburn's Laxa-Liver Pills for bilious headaches. I suffered awfully until I started to take them. They were the only thing that ever did me any good. I never have any bilious headache any more."

Milburn's Laxa-Liver Pills are 25c per vial, 5 vials for $1.00, at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

How does it Look to You?

Is it a good old world, or are there deep, dark shadows all over it? Are the people in it a jolly set, or are they a pack of fools and knaves? Are you getting along beautifully with what you have, or are there a thousand things you want which are just out of your reach?

Well the answer lies a good deal with you. Perhaps I ought to say, it lies wholly with you, but I will not. The way the world looks to us depends very much on what happens to us in it, and a good deal more it depends upon our bodily conditions. Sluggish livers and overworked stomachs make everything seem dark. Foul air breeds not only physical disease, but evil thoughts and morbid tendencies as well. A starved condition of mind often accompanies an underfed body, while an overfed stomach is quite as disturbing to one's outlook.

People sometimes complain of a lack of cleanliness among the poor, and the slums are referred to as "crime breeders." Perhaps both accusations are true, but how many baths a year would you take, where they from six to a dozen people in two or three rooms, or in a house where the average temperature is conducive to keeping on all the clothes you have, all the time? And is there not a natural relation between impure bodies and impure minds?

That virtue flourishes as it does, in spite of conditions in the poorer districts of our cities, speaks well for the human race, and God's watchful care over it. If it seem not so to you, go and dwell for a time in some overcrowded tenement district, living as the people there live, then for a like period stay in a beautiful, healthful country home. Environment more often than not determines character and achievement. Pure air, moral and physical cleanliness, are close friends; out of their union comes self-respect and from self-respect springs whatever there be about us that commands the respect of others.

Physical and Mental Causes.

Why do we become cross and irritable, nervous and pevish? Why, because in some way we are uncomfortable. The cause may be physical or mental, or both. Quite as often we find discord amid a plethora of the good things of life, as where there is a dearth of them. Those who herd closely together see too much of one another's way. What wonder, then, if inharmonious conditions arise?

Selfishness has a good deal to do with people's failing to get along comfortably together, but it is not the only cause. There are people whose presence seems almost a poison to some of those about them, and for such to be thrown constantly together is detrimental not only to the happiness, but to the health of one, or both. It is not good even for men and women who love and admire one another to be in too constant association. For the soul's good, we must sometimes be alone, absolutely free from people and their influence.

No stronger assurance of lasting happiness in wedded life can be found than when husband and wife sometimes lose sight of one another for a time. The joy of reunion is well worth the sacrifice. Interest in other people creates new interests for those who exercise it. The love shared with others redounds tenfold to those who bestow it. On more than one occasion it has been demonstrated that people who secured divorces did not really want them after all. What they wanted was only a break in the monotony, or a chance to get temporarily away from too constant sight and sound of one another. When the law gave them what they supposed they wanted, there was no happiness until it had again granted them permissions to go their way together.

One would suppose that for people of means there need be no cause for discord and discontent, but often there is. True. they enjoy greater freedom of life and possess the ability to gratify every mood and whim, but in this very freedom lies danger. "The jaundiced eye" cannot see things other than awry, and nothing is more conducive to perverted outlook than a super abundance of money and leisure Too often undesirable habits are the entering wedge. It seems a perversity of human nature. "Ne'er to see well what we're standing on," and the forbidden appears preferable to that which is ours. Society life, too, tends to "nerves" and a thoughtless, flippant manner, and mistakes are so easy to make. Everything to eat and drink and wear, and nothing to do, is a bad combination.

Nova Scotia Man Has Good News

FINDS IN DODD'S KIDNEY PILLS A CURE FOR HIS RHEUMATISM

States Out of His Own Experience That Dodd's Kidney Pills Are a Sure Relief From Pain.

Greenfield, Queen's Co., N.S., April 4th (Special.)—"To anyone who suffers from rheumatism I say: 'Take Dodd's Kidney Pills.' They will be sure to give you a release from pain." This is the message of Cornelius Hirtle, a well known farmer living near here. Mr. Hirtle suffered from rheumatism for four years and found a cure in Dodd's Kidney Pills.

"I was in bad shape for four years," Mr. Hirtle says in giving his experience. "My back and hips troubled me so much that I was not able to do much without suffering. I also had stiffness in the joints, my muscles cramped and I felt heavy and sleepy after meals. I had a better taste in my mouth, especially in the morning. My appetite was fitful and I was often dizzy.

"I suffered from shortness of breath, I was often dizzy and I was depressed and low spirited.

"I took six boxes of Dodd's Kidney Pills and they did me so much good that I am recommending them to all my friends. They are better than any doctor."

Ever one of Mr. Hirtle's symptoms was a symptom of kidney disease. That's why Dodd's Kidney Pills cured him.

Worms are Enemies of Children

Worms are one of the most dreaded diseases of children. There is nothing better than Dr. True's Elixir to expel worms of all kinds and to keep the stomach in good order. First manufactured by my father in 1851. Our mothers and grandmothers used this remedy and found it to be ideal for its purpose.

Trade Mark

Some of the signs of worms are: Deranged stomach, furred tongue, belching, variable appetite, increased thirst, acid or heavy breath, nausea, enlarged abdomen, variable bowel action, pale face of leaden tint, bluish rings around eyes, itching of nostrils, languor, irritability, disturbed sleep, grinding of teeth, irregularity of pulse.

If your child is not one of the robust kind, start in to use Dr. True's Elixir, the Family Laxative and Worm Expeller, today. 35c, 50c and $1.00. Advice free. Write me.

tion, eliminating from it what, under other circumstances, would have caused heartache or a burning desire for vengeance. To some, it seems a gift denied. God pity the man who has neither imagination nor humor. "Life is real, life is earnest," yet in spite of its serious phases it is exceedingly funny, too.

"This world is what we make it," but habits and environment largely determine what we shall be. To the chronic dpspeptic, the world will never look good. Fiery alcohol, soggy bread, foul air, and a lowered vitality, all warp the outlook and disposition, and determine the degree of success or failure. There are even those who claim that surgical treatment, not penal servitude, is the proper corrective of morals. At any rate, one judge in Michigan believes so, and his theories seem to have worked out pretty well, so far. It is not, however, a universal panacea with him. He picks his men.

Environment is a potent factor in men's lives, yet it is not all. Many have risen above it, and many more might have done so. Whether you or it conquers depends, largely, on strength of character, and a strong will is seriously handicapped unless backed by physical strength and vitality. Perhaps you are not sure of yourself; if so, it may be best for you to seek other surroundings, but in doing so, bear in mind that in putting aside this effort to conquer adverse circumstances, you are losing one of life's purest sources of joy.

Unpleasant though they be, hard knocks are conducive to strength. Snubs and persecution and ostracism, while seeming almost unbearable at the time, are worth enduring in a righteous cause. The brave man is he who dares stand alone, if need be, and sooner or later even those who now heap scorn and ridicule on him will gladly follow where he leads.

This is the best world you will know this side of the grave, and unless you mend your ways, it may be the best you will ever know, so why not take the best it has to offer? Only, however, as you give in exchange your very best, will the best come to you. God has alotted to you a span of years in which to live and enjoy. Take heed how you spend those years. Men pay for their follies and sins, and the day of reckoning comes at a time when they wish not.

Peace, honor and contentment are his only who orders his life aright. If to you the world seems good and howbright and true, it is because you are good and bright and true, because you understand how to obtain from it its sweetness and goodness, its gladness and worthwhileness. If to you it seems none of these, then is your perspective wrong, your vision distorted. God made this world for our physical and mental well-being, and, too, He made it but the vestibule to a world immeasurably greater and better. So "look not through a glass darkly," neither blind spiritual vision by wrong and sin or petty strife and inharmonious living.—Eva J. DeMarsh, Michigan.

Health Notes.

It is a mistake for the stout person to refuse to eat fat. Starches and sugars, represented in such vegetable foods as bread, rice, tapioca, and the like are fat formers. The living body has a power of making fat out of that which is not fat. And with this point is another—that fat itself does not go directly, at least, to make a valuable addition to the diet of a corpulent person because it has a power properly administered of burning off food excess. In more than one system of body reduction fat is, therefore, administered as an essential part and parcel of the diet cure.

It pays to Underdrain

The illustrations here are drawn from an actual photograph

The large plant was grown in soil that was drained three feet deep. The smallest plant was only drained three inches deep

The soil in the other cans was drained respectively—two feet—one foot—and six inches.

What better proof than this do you want of the value of drainage?

The Government Agricultural College will send a man to your farm to survey it and plan out a drainage survey for you, showing where to run it—how to run it—what to do—and the size of tile to use. All this at no cost to you, except the expense and the railway fares of the man.

For any ditching or draining down to a depth of two to three feet the MARTIN cannot be beaten.

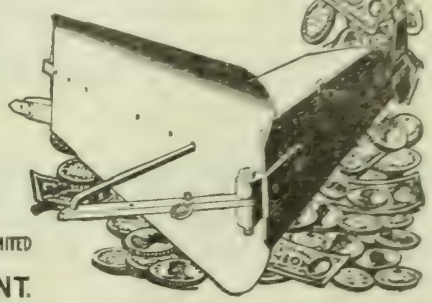
The MARTIN Farm DITCHER and Road Grader

(PATENTED)

will do as much work in one day, as fifty men can do with picks and shovels and do it better.

No farmer should be without it. It is a necessary part of every farm equipment. Its first day's work will pay for itself. It is very simple and will last a life time.

It is used for tile draining—all kinds of open ditching—road grading—for cleaning out ditches—grading up low ground—filling up gulleys—grading up your roads and driveways—landscaping, etc.



And the price only **$47.50**

Don't delay, but investigate at once. Write to-day for illustrated booklet.

The Trouble-Proof Roof

A roof that has stood rains, wind storms, and flying sparks for 18 years—the heat of 18 summers—the terrors of 18 winters—and is still giving service—carries its own recommendations.

There are hundreds such Paroid roofs to testify to the durability—yes, and economy—of Paroid Roofing—a roofing that can be well laid by farm help.

NEPONSET Paroid ROOFING

Paroid costs less than Shingles and is much the safer roof in case a fire is raging. Burning sparks and flying cinders do not affect a Paroid roof. Paroid is obtainable in Grey, Red and Green, and is the least expensive of all roofs on the only fair basis of comparison—service and satisfaction, and you waste no time repairing a Paroid roof.

Look for the Paroid Roll. By it you will know one of the 2,000 Neponset dealers in Canada.

Our booklet "Repairing and Building" will be sent you upon request—free.

Mother Hubbards Ironing Day

(Continued from Page 431.)

to another, and "Hang on to your hat," to still another. This all made me guess at the different relations he had with each young lady. Now it was the same young gentleman all the time and the difference must have been in the girls. I came to the conclusion that this young man anyway gave his friends the amount of respect, admiration or familiarity the girls taught him by their own conduct. A girl gets generally what she gives in familiarity. If she gives quietness and respect she receives the same; if she is flippant and familiar she may expect her friends to treat her lightly. Of course I'm old but I admired the quiet-mannered girls the most.

The Broken Glass.

Just here I hard a smash, so I left my ironing to see. A broken drinking glass and a baby in tears I found. "Don't cry, baby," I said, and picked up the pieces in one hand and the baby on the other arm. Life is too short to cry over broken things; broken dishes, broken promises or broken hopes. All we can do is clean up the mess and go back to work. No one likes to break things and once they're broken what's the use of fussing? I count it my fault if baby breaks things as I should know better than let her have things breakable where she can reach or get at them. I lock them up.

Making Life Beautiful.

So I got back to my ironing. I was now at the white aprons. A white apron is a nice thing when well ironed. Its moral effect, too, is very apparent. Take a fussy child and wash its face and put on a clean white pinafore and the child nearly always responds and is happy and peaceful. Clean, smooth clothes help us morally to be our best. I heard a man say once, "One of the big benefits of Sunday to humanity is that it all has a wash and gets on clean clothes. It increases the sum total of goodness, peace and happiness."

Whenever I'm especially tired I go, wash, and put on a fresh, clean dress, do my hair softly and if possible add a little perfume. It's amazing how much beeter I feel. There is much virtue in clean, well ironed clothes. So I faithfully ironed and put the polish on as I meditated.

Ironing Out the Creases.

There is another kind of ironing that is refreshing also. That is ironing out the creases that wear has put in. An old garment is renewed by it every time. Men especially like their things pressed often, and they should have them so as they cannot have the variety in clothes most women have.

There are other creases of wear, too, we can smooth out. Creases of worry on our friends face; creases of pain on our child's brows; creases of overwork in our neighbor's firm set mouth A little love, a little kindness, a funny story, a happy smile and the will and the action to help carry their load will smooth out these human creases and add much to the sum total of happiness about us. Is it worth while? It sure is.

—Farm and Ranch Review.

Britain's Greatest Remedy

The Proved Cure for
Nerve, Stomach, and Kidney Disorders in Young or Old.

The effect of the Famous British Remedy, Dr. Cassell's Tablets, on the human system is to increase that vital energy upon which health and fitness depend. The stomach and other organs gain new power from Dr. Cassell's Tablets, and thus nourishment is supplied to the entire system. The muscles recover strength, and the body is built up anew.

Dr. Chas. W. Botwood, D.Sc., Ph.D., &c., the well-known scientist, says, "Having had my attention called to many remarkable cures effected by Dr. Cassell's Tablets, and having personally investigated the same, I am now in a position to state that, as a safe and reliable remedy for loss of flesh and vigour, nerve affections and bodily weakness induced by deficient assimilation of beneficial food products, Dr. Cassell's Tablets appear to be unique, and I have no hesitation in recommending the same as a really trustworthy household remedy for young or old."

Throughout the world Dr. Cassell's Tablets are recognised as the great strengthening medicine, are Nutritive, Restorative, Alterative, and Anti-spasmodic, and of proved Therapeutic value in all derangements of the Nerve and Functional Systems in old or young. Unexampled success has established them as the modern home remedy for Nervous Breakdown, Nerve and Spinal Paralysis, Infantile Paralysis, Rickets, St. Vitus' Dance, Anæmia, Sleeplessness, Kidney Disease, Dyspepsia, Stomach Catarrh, Brain Fag, Headache, Palpitation, Wasting Diseases, Vital Exhaustion, Loss of Flesh, and Premature Decay. Specially valuable for Nursing Mothers and for all women during the Critical Periods of Life.

Druggists and Dealers throughout Canada sell Dr. Cassell's Tablets. If not procurable in your city send to the sole agents, Harold F. Ritchie & Co., Ltd., 10, McCaul Street, Toronto; one tube, 50 cents, 6 tubes for the price of five.

Folding Preginant Ewes

(Continued from Page 423.)

includes lack of exercise associated with folding on roots. Exercise s absolutely essential to the maintenance of health in the pregnant ewe and the proper development of the foetus. This is recognised by the sheepowner, and an endeavor is generally made to provide for it by removing the ewes from the folds during the few hours of daylight, and returning them again at sundown. But the animals freely supplied with roots do not keep moving about on the pastures as is their wont when dependent on grazing, and they soon acquire the knowledge that in a short time they wil be taken again to the roots left in the morning. Thus they lie about until this time arrives, when, with appetites quickened by their self-imposed fast, they have aonther gorge. Circumstances alter cases, and the character of the land varies in different parts of the country. But look at the state of the folds in wet weather on the heavier kinds of land. Are they fit, when fetlock-deep in mud, for animals heavy in lamb to spend from 16 to 18 hours out of the 24 in?

Evil Resultnig From It.

Th late Professor Robertson said: "There are at least two or three affections common, or rather prevalent, among our better-fed ewes and on our best lands, easily enough traceable to the repeated gorging or filling to repletion of their digestive organs. Of these the most common, and the least difficult to understand, is a rupture of the muscular walls of the abdomen. It is frequently associated with the presence of one or more dead foetuses, and attended with danger to the ewe in the accomplishment of the act, of parturition. The manner in which these results are reached is purely, or nearly purely, mechanical. The ewes thus affected are usually those with twins or triplets. As gestation advances the weight and bulk of the gravid uterus, added to the large bulk of innutritious food which the stomach contains, prove too much for the resisting power of the abdominal walls. This same distention of the digestive organs with a bulky material considerably below the normal temperature of the animal's body, and the accompanying pressure exercised on the gravid uterus, is largely productive of arrested foetid development and the occurrence of premature births." Prolapsus vaginae or protrusion of the genital passage—a common subject of question in these columns when ewes get near to lambing—is also traceable in great part to similar causes.

A Bad Lambing Time.

But how can this or any other bad system of feeding cause a bad lambing-time, or affect the "luck" at this season? Arrested foetal development means the death of the lamb in utero. Sometimes abortion occurs, but in most cases, where the ewe is concerned, the dead lamb or lambs are carried the normal period of gestation, or beyond it, and the results are far worse than those associated with abortion, which is very rarely productive of serious or dangerous conse-

quences to the ewe herself. Even the production of a greater or less number of dead lambs, where there are numerous twins and triplets, would be of small moment were it not connected, as the exciting cause, with the death of the ewe. This it causes from the prolonged retention of the dead foetus, the manual interference necessary to get it away, and the retention of the foetal envelopes, which, becoming decomposed and absorbed by the system, produce low putrid fever or septicaemia, certain to result in serious consequences to an exhausted animal, and one whose bodily condition is sure to be anaemic from having been largely fed on material containing an excess of water and a deficiency of nutritive matter. The lamber under such circumstances becomes contaminated with septic matter, a veritable walking source of infection to healthy ewes that he feels himself called upon to assist when in labor. Almost every ewe does require assistance, numbers bring one or more dead lambs, the ewes are weakly and unable to do justice to the survivor, they discharge for weeks a stinking matter that is highly debilitating, require special feeding to get up their strength, and numbers die, the mortality comparing with that of a maternity hospital in the "good old times" for which some of us affect to pine. It recognised that there is a difrence in turnips, but all roots contain a percentage of water that is far too high to furnish an ideal food for a pregnant animal. No one pretends that a few roots are dangerous to in-lamb ewes, that they may not be fed with safety in moderation, indeed with benefit, but we have seen recorded and personally had to do with too many cases of disastrous lambing in large flocks not to be convinced that there is danger generally in a large supply of turnips for in-lamb ewes.—Veteran, England.

Lime and Soil Productivness

(Continued from Page 414.)

Agriculture," by Harlow, appearing in the Annual Report of the Secretary for Agriculture, Province of Nova Scotia for 1915.

Further tests were tried at the College at Truro in 1915 on mangels and turnips. In the mangel exp riment, an acre of land was divided in two parts, the whole acre was treated with barnyard manure and one thousand p unds of acid phosphate per acre. On one-half of the acre marl, or limestone, was applied at the rate of four tons per acre, and on the other half no marl was used. The yield on the marled half was at the rate of 98 bushels per acre extra.

In the turnip experiment, which was an exact duplication of the mangel experiment, the yield on the lime plot was at the rate of 20 bushels per acre extra, which extra yield is so small that it might be accounted for by natural difference in the areas upon which the turnips were grown.

Expriments with garden crops gave somewhat uncertain results. Certainly one could not infer from them any decided advantage from the application of lime. Our present experience at the College Farm leads us to advise farmers to use limestone largely for seeding down purposes and to expect to get their big returns from the growth of clover and the subsequent enrichment of the soil. It is our belief that if the land is left down to clover and subsequent hay for a number of years, the ultimate results will be very unsatisfactory, but if a short rotation is practiced and clover sown once every four or five years, we expect that lime will prove the means of building up our soils.

CAN LIME RESTORE WORN OUT LAND TO ITS ORIGINAL FERTILITY?

No. Manure or some commercial fertilizer must also be used. The lime will correct the acidity, will improve the texture and generally make the soil more responsive to manure and fertilizer. On the other hand, manure of fertilizer cannot be used to correct the acidity. But the combination of the two, i.e., lime with manure or fertilizer and the subsequent clover and rotation of crops will pave the way for fertile fields and productive farms.

I cannot too strongly urge the point that while lime will assist in improving the productivity of soils, it is not a fertilizer and will not take the place of fertilizer. Used alone, on a fairly rich soil, it will give fairly satisfactory results for a year or two, but on the average soil the results are bound to be disappointing unless one knows what to expect. Used, however, along with barnyard manure, or commercial fertilizer and a proper rotation of crops lime, preferably ground limestone, will I am convinced, prove a most practical means of building up fertile soils in the Maritime Provinces.

How can a farmer know whether the application of limestone will pay or not?

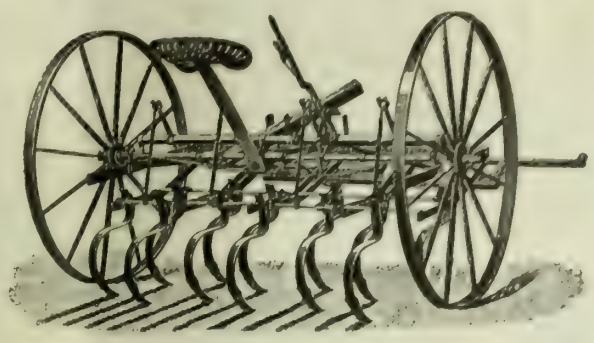
Ans.—Ask the soil. In other words try it. Each farmer, who possibly can, should apply ground limestone to small areas on several fields of his farm at the rate of 4 tons per acre.

(Continued on Page 438.)

Let Our Brains Work for You

The big, complete Frost & Wood line aims to get you more and more work done every year with less help and less expense.

The best paid work you can do on the farm is cultivation and getting the seed bed in good shape.



The Frost & Wood Cultivator is built and tested by practical men. We KNOW it will do more than is claimed for it.

For better cultivation use the Frost & Wood CHAMPION Spring Tooth CULTIVATOR

Great strength as well as up-to-date design is built into this fine implement. We know it will have to stand up under the hardest conditions for many years so we built it of heavy steel, strongly braced at all points.

The teeth and helpers are made of extra fine spring steel, and are held together in sections. There is a pressure spring for each section so that unequalities in the ground are compensated for and every inch is cultivated. One pressure lever controls all teeth sections, the lever being very easily worked and right at driver's hand.

Thousands of the "Champion" Spring Tooth Cultivators are in use and they are helping to raise the quality of crops all over Canada. A real money-saver, not an expense.

Fitted with either 2″ (reversible) points or 7″ thistle cutters and comes in 10, 12, 13 and 16 Tooth sizes.

Write to-day for Catalogue explaining this splendid implement in detail.

Try an Ad in the FARMER

System of Buying Milk.

A few years ago by far the larger proportion of milk handled by city dealers was brought from the producer on the basis of the measure, that is, the can and the gallon. Dealers as well as producers have come to recognize the inaccuracy of this system and its unfairness, both to themselves and to the farmers, so that in recent years the tendency has been to abandon it and adopt systems that are more nearly equitable and at the same time practicable.

Among the systems now comomnly used are the following:—

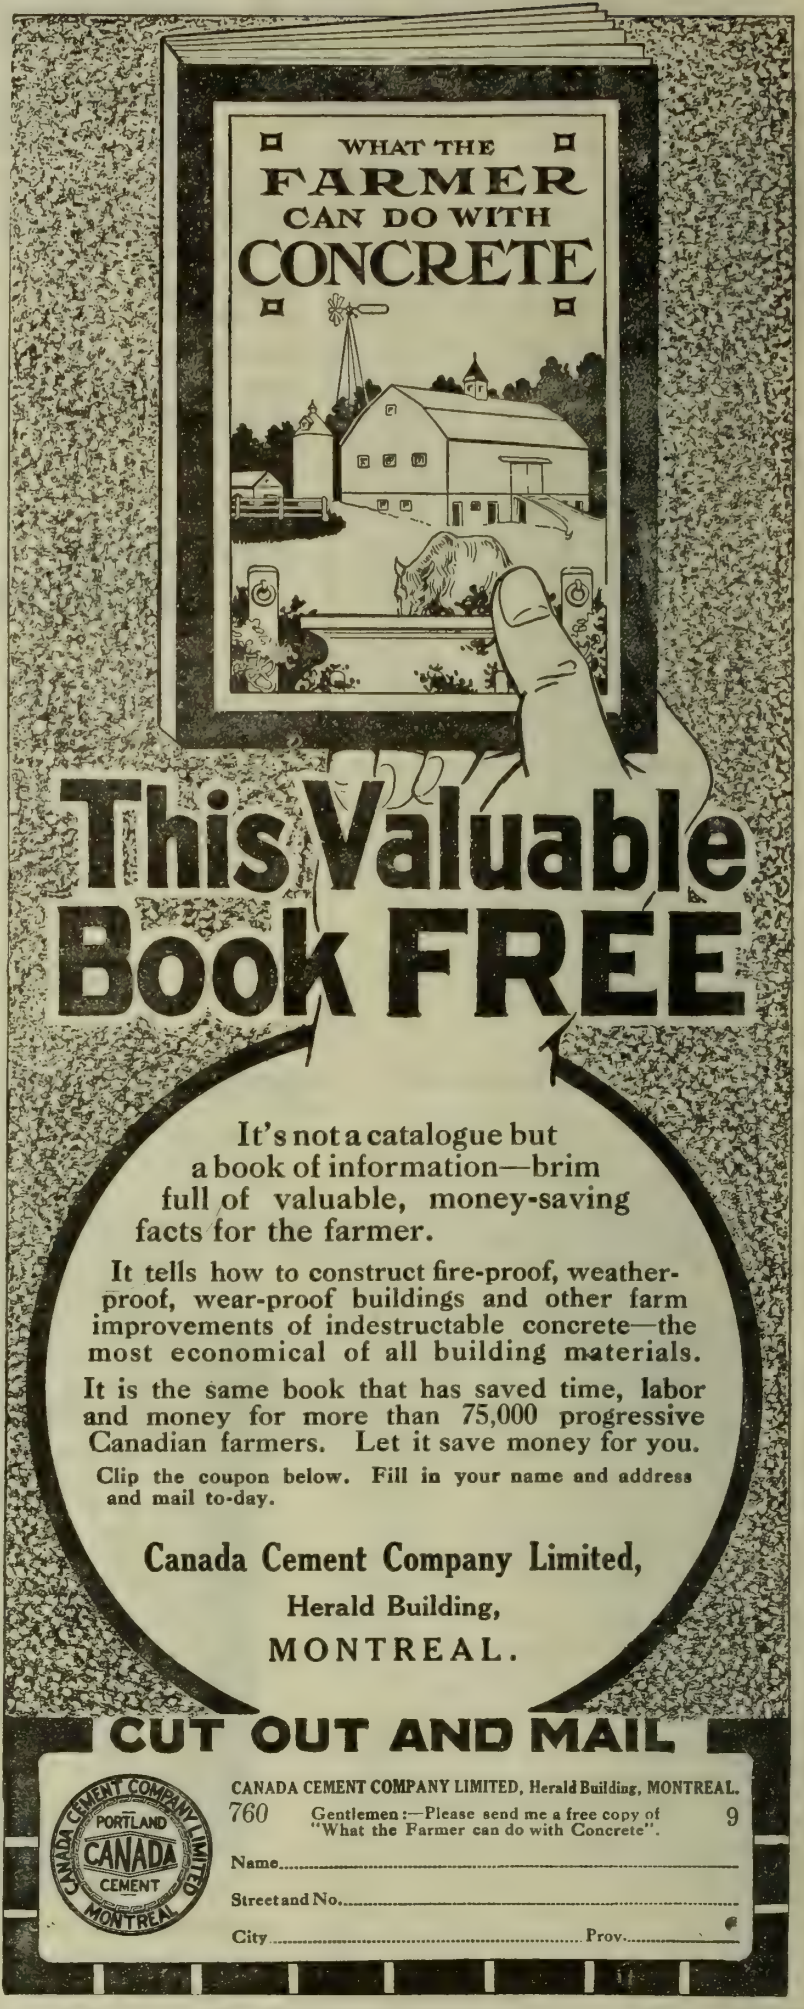
1. By the quart or gallon.
2. By the can, the size of the can varying from 8 1-2 to 40 quarts or more.
3. By the can; the can of milk must come up to the standard weight.
4. By the can or the gallon, with a minimum standard for butterfat, with a definite premium per gallon for each one-tenth per cent butterfat above standard.
5. By the gallon, the number of gallons being determined by dividing the weight by 8.6.
6. By weight, which is determined by the number of cans, each can being supposed to hold a certain quantity of milk by weight.
7. By weight, the milk being weighed at receiving station or at city plant.
8. Same as No. 4, with a minimum standard for dairy farm score, and premium for extra points in this score.
9. A certain price for a pound of butterfat and for 100 pounds of skimmed milk.
10. Same as No. 9, only the weight of the whole milk is considered instead of the skimmed milk.
11. On the weight basis, with a minimum standard for butterfat and premium for extra points. Sometimes the butterfat standard is established and deductions made for each one-tenth per cent below this standard as well as premiums for each one-tenth cent above it. In some cases the premium is paid only for milk of three-tenths per cent or more above the standard, while the deductions begin at one-tenth per cent below.
12. A certain price per 100 pounds, depending on the per cent of butterfat, allowing 3 cents per one-tenth per cent butterfat above or below the base price for the month for 100 pounds in summer and 4 cents in winter. (Base price for each month is from the average per cents of butterfat contained in the milk for those months for a period of years). Milk below 2.8 per cent butterfat is paid for on the basis of sweet-cream fat. Deduction is made for milk of solids not fat below 8.5 per cent.
13. A certain price per cent butterfat per gallon.
14. Grading of milk and paying from 3 to 4 cents per one-tenth per cent butterfat per 100 pounds for B grade: grades to be determined by (1) bacterial content of the milk; (2) sediment test; (3) acidity; (4) flavor and odor; and (5) temperature on arrival in city. For grade A milk a premium of 5 cents per 100 pounds is added; for grade C milk a reduction of 5 cents per 100 pounds is made from grade B prices. Should milk from a producer grade C for two successive months the dealer may cancel the contract.

In some cases in which milk is bought on the basis of the dairy farm score the farmer is allowed to score his own dairy.

When special milks are desired, other requirements are often made of the farms, and they are paid in proportion; for example, the tuberculin test is sometimes required.

When milk is bought by weight, it is necessary, from time to time, to test the scales used in weighing it.

There is no doubt that milk should



This Valuable Book FREE

It's not a catalogue but a book of information—brim full of valuable, money-saving facts for the farmer.

It tells how to construct fire-proof, weather-proof, wear-proof buildings and other farm improvements of indestructable concrete—the most economical of all building materials.

It is the same book that has saved time, labor and money for more than 75,000 progressive Canadian farmers. Let it save money for you.

be bought as much as possible upon the basis of quality. The farmer who sells clean milk should get more than the one whose milk is dirty, and it is seldom questioned that the weight and the butterfat systems of buying are the proper ones. Of course it takes time to establish a new system of buying in any locality. The farmers are accustomed to the old system and are often loath to take up with new systems, although clearly to their advantage. Dealers, however, are working more and more in this direction and the time seems to be approaching when all milk will be paid for on more uniform and equitable bases — Milk Plant Letter 23, U. S. Dairy Division.

Scurf on a Horse.

Can you tell me the remedy for scurf on a horse? Every attention has been given in the matter of feeding and grooming, and he is in first rate condition, but he is covered with fine scurf, with here and there lumps of scurf, and in places the hair comes off, or can be pulled off with ease. He has been in this condition for 12 months, and I have given him Epsom and sulphur frequently in small doses, hoping to get him right, but with no good result. I take it, therefore, that there is some disorder of the blood.—E. B.

The common names for this trouble are blotch, surfeit, etc., and it is usually more often noticed in the early spring of the year. When these eruptions have remained a few days the outside skin peels off, leaving a small scaly spot, but rarely a sore. It may be occasioned by over-feeding, etc. You say that he is in firct-class condition. You should not let him have maize, beans, or much clover hay. Let him have about 6 lb. of crushed carrots daily, also daily exercise. The first fine day have the hair washed all over with soft soap and warm water to which has been added some Lysol or Jeyes' fluid. Have him dried and then well rugged up. Often a good sweating will get a lot of it out of the coat. Give once a week three or four ounces of Glauber salts and a quarter of an ounce of nitre in a bran mash. See that the horse has a piece of rock salt in his manger and is not being fed too generously for the amount of work required daily.—Southern Vet.

How to Bring the Hay Fork Back to the Load Easily

One L of the principal barn on the Hoard's Dairyman farm is ninety feet long an dthe hay fork has to travel the distance to deposit its load at the farther end. Consequently it is hard for the men on the load to pull that fork an dthe heavy rope back to the load. Thinking of this one day, we saw a way of making the horses that work the hay fork, pull it back to the load when they returned to the barn.

To do this we added ninety feet to the trip rope and run it through a small pully fastened to an iron stake in the ground, placed just where the horses stopped when the fork was dumped. At the end of the trip rope was a hook. When the horses stopped th end of the trip rope was there. The driver hooked it into the clevis of the evener and the horses pulled the fork back to the load as they returned ot the barn. It proved a great labor saver and the cost was trifling.

For a blistered heel, scrape a little yellow laundry soap to a paste with a Very little water, and apply to the spot. As a preventive, thoroughly soap the inside of the heel before starting out on a long tramp.

Raw beef applied to the afflicted part affords a speedy relief when severe inflammation seems to threaten appendicitis. This has been tested recently by a physician.

LIFE INSURANCE FOR YOUR HOUSE

Unpainted wood means decay. Not to paint your house, means a constant expense for repairs. Paint protects against wear and weather. When you take out our "100% Pure Policy", your house is insured against decay. Such paint protection resists the destructive effects of climate and temperature, besides adding beauty and distinction to the home and value to your whole property.

MARTIN-SENOUR
"100% PURE" PAINT

means life insurance for your home. The genuine White Lead, Oxide of Zinc, Pure Colors and Linseed Oil—ground to extreme fineness by powerful machinery—form a combination that protects against decay.

"100% Pure" Paint makes protection sure. It spreads easily, covers completely and is the cheapest in the end because it covers more space per gallon. In all colors for spring painting.

Lime and Soil Productivness

(Continued from Page 435.)

Use it preferably on land which is being seeded down to clover. It will take two seasons before you will get results, but then you will know. In the meantime I would strongly warn farmers not to expect limestone to take the place of manures or fertilizers which they have been using. It will not, all of which means that the farmer must get his limestone at a low price per ton. Finally, I am bound to commend the progressive measures which the New Brunswick Department of Agriculture has taken to make this experimentation easily possible for farmers. Address by Prof. M. Cumming, Truro, N. S., before the recent annual convention of the New Brunswick Farmers' and Diarymen's Association at Fredericton.

N. B. Potato Growers Convention

(Continued from Page 415.)

2.30 p.m., Mr. C. M. Shaw, of Hartland, in the chair.

The first item was an address by Professor William Stuart, Horticulturist in charge of Potato Investigations, of Washington, D.C., on "Potatoes." The address was illustrated by lantern slides, which dealt with the different phases of breeding and selection work n potatoes. Professor Stuart has had many years experience in this line of work, and in a very interesting way, described the methods adopted in obtaining crosses of different varieties with a view to greater production.

At the conclusion of Professor Stuart's address, the report of the nominating committee was handed in which contained names of the following gentlemen as officers of the Potato Growers' Association for the ensuing year:

President, Mr. T. W. Caldwell, Florenceville, N.B.

Vice-President, Mr. Donald Innes, Tobique River, N.B.

Secretary, Mr. G. C. Cunningham, Fredericton, N.B.

Treasurer, Mr. W. H. Moore, Scotch Lake, N.B.

Auditor, Mr. C. M. Shaw, Hartland, N.B.

It was moved by Mr. W. W. Hubbard, seconded by Mr. W. E. Palmer, that the report of the nominating committee be received and adopted. This was carried unanimously and the meeting was then thrown open by the chairman for general discussion, which was taken part in by the majority of those present.

A vote of thanks was tendered the speakers, especially to those who had come long distances from outside the Province to be present. Towards the close of this meeting 50 of those present signed the register as members of the new-formed Association, and the prospects are bright for many more enrolling in the near future, the objective of the Association being to reach every grower of potatoes in the Province by enrolling them as members, either of the main Association or of the main Association or of Sub-Societies which it is proposed to form in each community.

On motion of Mr. B. M. Shaw the Maritime Farmer was unanimously chosen as the official organ of the Association.

The fifth and final session was held at 8.00 p.m. in the Hayden-Gibson theatre, and the addresses given were interspersed with a musical programme which was kindly arranged for by Mr. C. O. MacDonald, Manager of the Royal Bank of Canada, Woodstock, who was also the accompanist of the evening. The numbers were: A song by Mrs. Squires, two songs by Mr. Harry Dunbar, a well-known local impersonator of Harry Lauder, and two splendid violin solos by Lieut. Carleton Brown, C.A.S.C.

The first address was on "The War," by Mr. J. D. McKenna, Business Manager of Maritime Farmer. Mr. McKenna is a forceful speaker and has evidently made a close study of past and present conditions connected with the struggle in which the Empire is now engaged.

Mr. J. H. Grisdale, Director Dominion Experimental Farms, was the next speaker. His address was entitled, "Patriotism and Production." Mr. Grisdale is well known from one end of the Dominion to the other, and in a very forceful address he showed how agricultural production may be increased, especially at this time when every available acre of land should be utilised for the production of food supplies. He also gave an interesting account of the assistance the Federal Department of Agriculture is affording to farmers in the Dominion through the medium of the Experimental Farms and invited correspondence from all who might be looking for help and guidance on any agricultural subject.

Any information with regard to the Association may be obtained by writing Mr. G. C. Cunningham, Secretary, Fredericton, and it may here be mentioned that the "Maritime Farmer" has been adopted as the official organ of the Association and will contain news from time to time regarding the activities of this organization as it becomes available.

It is hoped that all potato growers and anyone interested in agriculture will get in touch with the Association, either by becoming members or applying at any time for information. It has been organized to promote the interests of the potato industry in the Province, by disseminating informaation on methods of cultivation, suitable varieties, seed improvement, grading and standarizing, marketing and eradicating and controlling fungus and insect diseases and other allied subjects. It has adopted a wide and efficient policy for the improvement of the potato crop. During the coming year, special attention will be paid to potato improvement for seed and table stock, through keen selection and the control of potato diseases. It is hoped to accomplish this task by the members of the Association conducting co-operative experiments along several lines. The outlines of these experiments will be published in the "Maritime Farmer" at an early date and all who are interested are invited to take up some line of work.

The Association is indebted to the Provincial Department of Agriculture for having financed this initial Convention and for the support and encouragement which they are willing to give towards the improvement of the potato industry.

GEO. PARTRIDGE,
Acting Secretary.

CONSTITUTION AND BYE-LAWS.

Article 1. Name.

The name of this organization shall be, the New Brunswick Potato Growers' Association.

Article 2. Object.

This Association has been organized to promote the interests of the potato industry in the Province of New Brunswick. It shall be the object of the Association to assist in the dissemination of knowledge on methods of cultivation, suitable varieties, seed improvement, grading and standardizing, marketing, eradicating and controlling fungus and insect diseases, and other allied subjects.

1. By collecting and disseminating the best available information relating to both the practical and scientific phases involved, in increased yields coupled with a lessened cost.

2. By encouraging proper cultural practices in relation to the maintenance of soil fertility through the proper use of fertilizers and by promoting the introduction of modern potato machinery.

3. By encouraging the cultivation of pure varieties of potatoes for all commercial purposes.

4. By giving special attention to seed improvement, to the dissemination of standard commercial varieties and by encouraging the elimination of

Farmers' Clubs Find Us Satisfactory

We are doing a splendid trade with Farmers' Clubs and our

Cream of the West Flour

the hard wheat flour guaranteed for bread

is giving every satisfaction. For example, here is a letter received from Mr. Hester W. Healy, Secretary of the Cleveland Farmers' Club, with headquarters at Richmond, P. Q.

Dear Sirs :—

I wish to say that you have given us the very best satisfaction, and the quality of feed and flour has been fine. We may not order any more this Spring, as we think that we will have enough to carry us through to grass. If we find that we can use another car this Spring we will certainly give you the order. We will be in the business next Fall again, and will very likely use more next season than this.

Our ***Cream of the West*** is a strong, nutritious, light-raising Western Wheat flour that makes the finest of home-made bread.

Queen City Flour is a blend of Ontario and Western Wheat—an excellent all-round bread and pastry flour.

Monarch Pastry Flour is milled from Ontario soft wheat exclusively for pastry purposes.

undesirable commercial types.

5. By encouraging the community plan of raising desirable varieties (one or two varieties to a community.)

6. By encouraging the grading, standardizing and certification of table and seed varieties.

7. By investigating the demands of all available markets and assisting New Brunswick growers to meet such markets.

8. By assisting in controlling and eliminating fungus and insect pests and in preventing the introduction of new diseases.

9. By investigating methods for the profitable utilization of surplus and cull potatoes.

Article III. Association Work.

Clause 1.—The Association shall hold an annual Convention and shall provide a special programme of topics related to the potato industry, and it is recommended that a potato exhibit be held therewith.

Clause 2.—It is further recommended that the Association send an exhibit to the Canadian National Exposition at Toronto, Ont., and shall maintain a booth on the Exhibition grounds. It shall send exhibits to such other important Expositions as the Executive Committee may decide upon.

Clause 3.—The Association shall establish Sub-Societies and such other affiliations as shall be to the benefit of the potato industry, when deemed necessary.

Article IV. Organization.

Clause 1.—The organization shall consist of the New Brunswick Potato Growers' Association and Sub-Societies.

Clause 2.—The Sub-Societies shall be formed in isolated districts having one centre and local interests.

Clause 3.—The boundaries of the Sub-Societies shall be defined by the Executive Committee.

Clause 4.—The Maritime Farmer shall be the official organ of the Association.

Article V. Membership.

Clause 1.—Potato growers and all commercial interests concerned in potato production, within the territory covered by the Association, are eligible for membership in this Association.

Clause 2.—Membership in the Sub-Societies shall constitute membership in the Association.

Clause 3.—Honorary membership may be conferred upon anyone interested in the advancement of potato growing.

Article VI. Officers.

Clause 1.—The officers of the Association shall consist of a President, Vice-President, Secretary, Treasurer and an Auditor, all of whom shall be elected by ballot at the annual Convention and shall hold office for one year, or until their successors have been chosen.

Clause 2.—The President, Secretary and Treasurer shall constitute the Executive Committee of this Association.

Clause 3.—The President shall appoint such committees as may be deemed necessary, subject to the approval of the Executive Committee, or the Association.

Article VII. Officers of Sub-Societies.

Clause 1.—The officers of the Sub-Societies shall consist of a President, Vice-President, Assistant Secretary and Treasurer, all of whom shall be elected by ballot at the annual Convention and shall hold office for one year, or until their successors have been chosen.

Clause 2.—The Treasurer of the Association shall serve as Treasurer of all Sub-Societies.

Clause 3.—The Secretary of the Association shall be Secretary (ex officio) of all Sub-Societies.

Article VIII. Advisory Board.

The Director of the Dominion Experimental Farms, the Dominion Botanist, the Dominion Horticulturist, the Superintendents of the Dominion Experimental Farms within the area, the Secretary of Agriculture for New Brunswick, the Provincial Horticulturisa and five members of the Association elected by ballot at the annual Convention, shall serve as an advisory board.

Article IX. Amendments.

The Constitution and Bye-Laws of this Association may be amended at any annual Convention by a two-thirds majority vote, provided notice of the proposed amendment has been submitted to the Secretary at least one month previous to the meeting. Members unable to be present may submit their votes in writing.

BYE-LAWS.

Article 1. Duties of Officers.

Clause 1.—It shall be the duty of the President to preside at all meetings of the Association, to appoint necessary committees and attend to such

(Continued on Page 442.)

$298 For a Separator

A Farmers' Startling Discovery.

Made in Canada.

THE other day a startling discovery was made by a leading farmer. He found that his cream separator had cost him nearly $300, and if he continued to use it as long as it would likely hold together (10 years or so) it would cost him altogether very close to $500.

This farmer milks 18 cows (good ones) for they average 6000 lbs. of milk each, yearly. Altogether he gets 108,000 lbs. of milk in the year. He skims that milk and sends the cream to the Creamery, getting about 25c per lb. for butter fat. So far, so good.

.16 per cent.

BUT ths farmer has discovered that his separator does not skim as close as a really good separator should. It leaves .16 per cent butter fat in the skimmed milk, and .16 per cent butter fat lost in 108,000 lbs. of milk amounts to 172.8 lbs. of butter fat. Figuring at 25c per lb. this means $43.20 lost on the herd yearly.

The loss on a separator, like the Standard, that skims to .01 per cent will be only $2.70 on the whole herd, so that the actual UNNECESSARY loss of this farmer is $40.50 per annum.

$40.50 x 6

This farmer has had the machine for six years and it has therefore cost him six times $40.50, a total of $243. The first cost of his separator, $55, added to $243 makes a total of $298, the actual cost of his machine to date. If he uses his machine four years longer it will have cost him $460, whereas the first cost of a good machine like the Standard, would be about $85.

How about your machine? Do you know how it skims? You may claim that what you don't know cannot hurt you. We assert that it is what you don't know taht does hurt you. The money value of the fat your separator leaves in the skimmed milk is lost just as much as if someone took it out of your pocket. An inefficient separator is just as much a thief as the slick pickpocket; a worse thief, in fact, because a poor separator keeps picking your pocket all the time.

On the other hand, a good separator like the Standard will put money into your pocket The

Standard

skims to .01%. This statement may surprise you, but Government Dairy School tests will prove it. No matter the season of the year, or the quality of the milk, or the breed of the cow, there is no separator made that can do better work than the Standard. We doubt if there are any that can be as well. We are always willing to have the Standard tested alongside other makes.

Full particulars about the Standard are given in our Separator catalog. Send for a copy. It's free.

Maple Green Farm Holsteins

To avoid inbreeding, we now offer for sale our senior herd bull "Maple Grove Mercena Mercedes," coming 5 years old; weight about 2500 lbs., active, sure and exceptionally kind. His first daughter to be officially tested made 15.46 lbs. butter in 7 days at 1 year and 11 mos.; another at 2 years and 2 mos. was making nearly 3 lbs butter per day when she met with an accident and we had to drop testing her. His dam gave 12664 lbs. milk and 568 lbs. butter at 2 yrs. old in the R.O.P., and her sister Posch Mercedes Springbank 2nd, is the Canadian Champion 4 yr. old in the R.O.P. with 22000 lbs. milk and over 800 lbs. butter in the year. We are also offering Bull and Heifer Calves sired by him and "King Lyons Colantha" and out of high-class Record of Merit and Record of Performance Dams.

Persistent failure to comply witl the requiremeats of Article II. of the Bye-Laws shall be considered sufficient reason for the termination of membership, if endorsed by a majority vote.

Article IV. Voting.

Members unable to be present in person, may vote on any question by letter.

STOCK NOTES.

On another page of this issue will be found an advertisement announcing the dispersion sale of Mr. James Benning's pure bred herd of Ayrshire cattle at Glenhurst Farm, two miles from Summerstown Station, G.T.R., fifty miles west of Montreal. Trains from the East arrive at Summerstown at 11.48 a.m. and 6.33 p.m. Teams will meet trains from each way day of sale and ample accommodation will be provided for those wishing to see stock before day of sale. The sale begins at One p.m. sharp on Wednesday, April 19th. Trains leave for the East at 7.59 a.m. and 5.04 p.m.

This herd was founded 55 years ago by the late David Benning by his own importations from Scotland. Mr. Benning was a good judge of Ayrshire cattle and took a great interest in their development.

There has never been a case of tuberculosis in the herd. Four-year-olds have made over 11,000 lbs. of milk, and two-year-olds 9,000 lbs. milk in one year.

Animals from this herd have gone to all parts of the United States, Canada and Japan, making records wherever they went. The Chicago World's Fair champions, male and female, were bred in this herd.

Parties unable to attend the sale may have their commissions attended to free of charge by the auctioneer, A. Philips, M.L.A., Huntingdon, Que., or the proprietor, Mr. James Benning. Send for catalogue if interested, then send your commissions, or better still attend the sale in person.

GUERNSEY RECORDS.

D. G. McKay and Son, Spruce Grove Farm, Scotsburn, N.S., writes:

We have sold all the stock which we had advertised in the Maritime Farmer. We sold six head all togethe and have nothing for sale now except some bull calves

The following records of performance were recently made at Spruce Grove Farm.

In the aged cow class Flora's Heiress, No. 83, 8,358 lbs milk, 430 lbs. fat, 501 lbs. butter.

Lady Pauline II., of Spruce Grove, No. 321, 8264 lbs. milk, 483 lbs. fat, 563 lbs. butter.

Four-year-old Class.

Hieress Daisy, No. 318, 8182 lbs. milk, (64 lbs. fat, 424 lbs. butter.

Two-year-old Class.

Hieress Rosy, No. 612, 6696 milk, 339 lbs. fat, 395 lbs. butter.

Charlotte, of Spruce Grove, No. 891, 6287 lbs. milk, 353 lbs. fat, 411 lbs. butter.

Jennie, of Spruce Grove, No. 889, 7607 lbs. milk, 394 lbs. fat, 459 lbs. butter.

We recently purchased at Hugh A. Dickson's sale the highest priced cow in the sale, "Queen Bess of Dixieland." This cow stood first at Halifax and Fredericton in the three-year-old class last fall.

Her official record in the two-year-old class for ten months is 6969 lbs. milk, fat 396 lbs, 462 lbs. butter.

Get a Power Sprayer Now

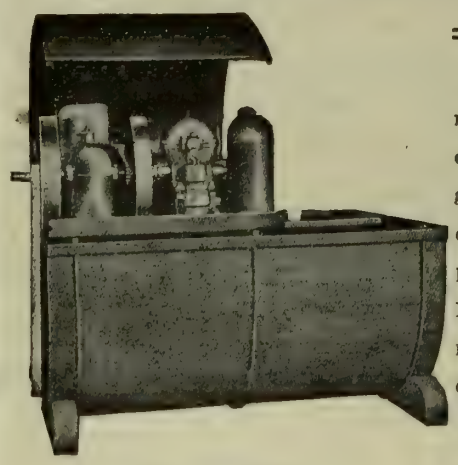
Each machine guaranteed for 2 years against REPAIR.

Each machine will handle 2 lines of hose at 250 lbs. pressure, deliver 6½ gals. mixture a minute and easily apply from 1200 to 1500 gals. a day.

Engine can be instantly released for other POWER PURPOSES, such as sawing wood, etc.

Engine parts interchangeable with "Ford" motor parts. Therefore engine is standard.

I. X. L. JUNIOR Automatic Power Sprayer



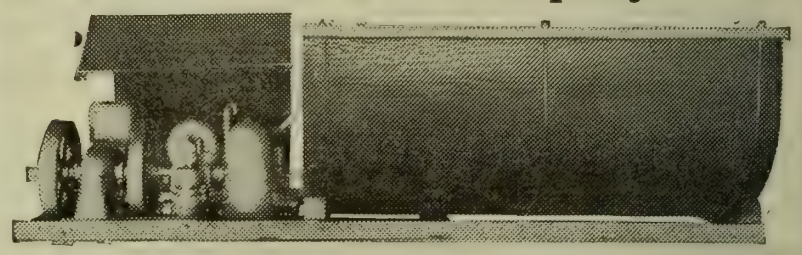
The I. X. L. Junior is made in two styles. It consists of a 3½ H.P. Engine, cypress tank, gear driven vertical cylinder pump, two 25 ft. leads of Hose, two visible spray nozzles, complete in all details.

Weight, 450 lbs.

I. X. L. with 100 gallon tank, $165.00
I. X. L. with 150 gallon tank, 170.00
I. X. L. with 200 gallon tank, 180.00

For rough or hilly orchards, common in some parts, the machine which best fills the requirements is our back-mounted.

Pontiac Special
Automatic Power Sprayer



This machine is equipped with the same engine as the I.X.L., and is made with two size tanks.

150 Gallon Tank, 50 ft. Hose, 2 poles $200.00
200 Gallon Tank, 50 ft. Hose, 2 poles $210.00

We have prepared a valuable booklet entitled, "Prize Fruit and Vegetables from your Orchard and Garden," which is free to all farmers, fruit and vegetable growers. Use the coupon and send for your copy to-day.

THE HOME VEGETABLE GARDEN

By Prof. W. S. Blair, Kentville, N. S.

An effort should be made by every man who has a plot of ground to grow the garden produce required for the home. It is profitable to do it, and it adds greatly to the interest of the home life. More garden produce means less outlay for running the house, economy should be a first consideration. The more we produce in our own lands, the more surplus will there be left for export to feed the millions of people depending upon our exports for the successful termination of the war. It seems right, therefore, that every one should consider seriously the matter of growing everything they can to meet their own wants, even should extra effort be necessary. With this in view an effort will be made to deal briefly but fairly specifically with certain garden crops from time to time as to their cultural requiremens.

ONIONS.

Onions are used extensively throughout our country and in our towns, yet these are largely imported. It is not difficult to grow onions if right methods are followed. It is practically impossible to grow onions and mature them from sowing the seed in the open ground. The season is not long enough to mature them before the cool damp weather approaches, and they consequently keep on growing without maturing properly, hence will not keep.

For success start the seed now, the earlier the better. Secure a box 3 inches deep fill it with good garden soil. If such soil is not available pick it up in the garden and place it near a stove where it will soon dry out and be ready for seeding in a few days. Make the soil even in the flat and scatter the seeds rather thickly, about 15 seeds to the square inch and cover with about 1-4 inch soil. Keep the soil moist, not wet, and warm, not hot, and in a short time the seedlings will appear when the box is set in the brightest widow in the kitchen. A very litte effort will make a support for the box. Do not force the plants by keeping the box too warm, and do not keep the soil too wet. Onions do not require too much heat to grow sturdy, but give all the sunlight possible. Sunlight is what makes strong plants, and during the bright warm days set the flat in a protected place outside, or they may be set in the hotbed or cold frame. This flat of onion plants will plant out a good area. I have set 1000 plants from a square foot of soil. These spaced 4 inches apart will give over 300 feet of a row, and this row when matured from good plants started two months before planting out time should produce 4 bushels of well matured onions at 5 cents per pound wotrh $12.00.

Onions are easily transplanted. They should be transplanted as early in May as the ground can be worked nicely. The bigger and stockier the plants the better will they do. Harden off the plants well by leaving them out a week before transplanting. Late set and small plants will give results little if any better than to sow the seed in the open ground, hence, the importance of starting the seed early. The better the soil used in the flat the quicker the growth, but do not force growth by a high temperature. A rich soil and low temperature will give the best plants.

Any good garden soil will grow onions to mature early in September. Soils containing quickly available plant food is necessary. If manure is to be used have it will rotted if possible. Suitable soil can be arranged for when the time comes, but to have the plants it is necessary to get busy now. The Yellow Globe Danvers, and Priztaker are two excellent varieties.

To illustrate the importance of making an early start the results from our plots seeded in flats February 28th show an average of 10.3 oz per bulb and those planted March 17th 7.1 oz. It cost little more to transplant the onion than it does to plant and thin onions from seed sown in the open The plants require but one transplanting, that from the seed flat to the open ground.

CELERY.

Celery seed should be started now. Use a flat or shallow box with 2 to 2 1-2 inches of soil. The seed takes from about 10 days to germinate, during which time the box can be set any place that is moderately warm. Keep the soil damp but not wet. When the seedlings appear place in a bright window. A small box 6 inches square will give all the plants required. The White Plume and Paris Golden are the two best varieties. In about six weeks time the small plants can be transpalted to other flats, spacing the plants 1 to 2 inches apart.

Strong vigorous plants are necessary and these can be got by early seeding. Any rich garden soil will grow good celery if good plants are secured for starting.

The celery seed should be just covered with soil and use every care in watering not to soak the soil too much.

PANSY.

Now is the time to put in a little box of pansy seed. They can be handled the same as onions. Stick to the shallow flat and a bright window. Late planting will not give early blooming plants, hence, the importance of starting this lovely plant now. Just nicely cover the seed about 1-16 inch of soil will do for covering.

HOTBEDS.

In order to have vegetables covering as long a period as possible it is necessary to have a hotbed. Some plants cannot be brought to maturity without the hotbed to start the seeds in and develop the plants for setting out. The expense connected with the hotbed is not great. The size of frame required is one large enough to carry four sashes each 3 feet wide and 6 feet long. Two inch plank is usually used. The back of the frame is 15 to 18 inches high and the front 10 to 12 inches. The planks are spiked to the end pieces which are 4 inches under the 6 feet, and three 2 by 2 cross pieces are put level with the top of the frame to carry the edge of the centre sashes. Boards can be used for the frame but the planks are much more satisfactory and durable.

The sashes are usually made up of 3 rows of 10 by 12 glass which are lapped so that the water will run off, 16 lights are required for each sash. The sashes usually cost about $2.25 each complete The unglazed sashes cost usually $1.25 each. Any window sash can be used and a frame any size to fit the sash can be made. Outside window sashes are often used, and if properly kept painted and laid away after they are not wanted it does not injure them appreciably. After a rain they should be lifted to let the water run off so that the putty will not be loosened.

The hotbed should be located on the south side of a building, or protection of some sort is advisable.

The manure used is placed on the surface of the ground. Horse manure is the best to use as it gives a uniform and lasting heat. The bed is made at least one foot larger on each edge than the frame. The frame is set on this when it is finished. If the pile is made too narrow and the edges not well [illegible] the frame will settle at the edges and the inside become rounded, hence the importance of using care in getting the edges well put up. The manure is scattered evenly in layers building the whole pile up so that it will settle evenly. If the manure is dry it should be tramped and possibly some water to dampen it may be advisable. If it is damp very little tramping, except that caused by the forking over the manure, will be necessary. Manure that has been "fire-fanged" is not of any value, and when saving up the manure care should be taken to see that it does not become "burnt-out." If the bed is started early 2 1-2 feet, which will ultimately settle to 18 inches, should be used. Two feet of good manure makes a good bed after the early part of April.

After the manure is placed the frame and sashes are put on the bed and it is allowed to remain for a week giving a little ventilation to allow rank gases to escape. An inch or two of soil, cinders, ashes, or sand is then placed on the manure to level it up if flats are to be used, or if soil is to be used this can be put on to a depth of 5 inches. The bed then should be in good condition for starting seeds.

Any good garden soil is suitable for starting seed in. It is not advisable to have the soil excessively rich as this forces growth too rapidly. A light loamy soil is advisable.

Much care is necessary in order to give proper ventiliation. If the weather was in any degree constant specific directions could be given, but owing to varying sunshine, wind and outside temperature conditions this is impossible. Keep in mind that the space between the glass and the plants is very small, and that a bright sun will run up the temperature very rapidly, and in fact burn the plants in a short time if left without a slight ventilation, on the other hand too much ventilation may chill the plants in a short time. It does not take long to form judgment in the management of the frame if one but gives a little thought to it. A temperature of the soil ranging about 60 degrees may be considered about right, but considerable variation either way may not cause injury. It is better to run the bed fairly low, as the plants are much more stocky. If the plants are forced by high temperature they become weak and spindling.

The watering requires care. The soil should not be soaked particularly during dark cold days when it is impossible to ventilate very much. The watering should be done about noon so that the plants and bed can dry off before being closed for the night. It is not good to use ice cold water on small seedlings as this chills the plants.

If a very cold spell approaches it is wise to protect the plants by putting bags or rugs over the glass. This is particularly desirable if the manure has not been heating well or if much heating material has not been used. Usually the heat of the sun is sufficient for the day time, but for night the heat from the fermenting manure is depended upon. Old heavy bags sewed together form a splendid cover and the cover should be made large enough to come down over the edge to shut off th air from the edge of the sash. A little attention to this will give a more even temperature in the bed during the night and possibly prevent freezing during a very cold night.

The hotbed can be made any time now; in fact it is well to get busy at once as we are not far from the first of April when seeds of some plants should be started, and the bed should be made a week before any seeding is done.

If women could make hotbeds nearly every farmhouse would have one, but it is a man's job. The women can look after the details connected with the management of the hotbed better

(Continued on Page 453.)

Varieties of Potatoes Suitable to N. B.

By W. W. Hubbard, Supt. Dominion Experimental Station, Fredericton

There are doubtless growers here who could tell the Association more about th results obtained from certain varieties than I can, so far as yield and sale results are concerned, and as there is time for discussion after I have concluded my few remarks in openeing this subject, I hope that those who can do so will offer their evidence.

I do not pretend to any specially important knowledge on this subject, as my experience of competitive tests of varieties extends only over three years, and these tests have not been carried to their conclusion in the market or on the table.

So far as varieties suitable to this province are concerned I really cannot say that any well recognized variety is unsuitable, for we undoubtedly have a soil and climate unexcelled in securing both yield and quality with practically all varieties.

However, there are other things besides yield and actual quality which make one potato more profitable than another, and one of the most important is attractive appearance. This means, speaking generally, a smooth symmetrical shape, eyes as shallow as possible and an even decided color. Another important detail is that the tuber shall be of a shape which will enable it to cook quickly and evenly and that it shall be solid throughout—not hollow hearted, and last but not least in point of profit, that the tubers shall be similar in shape with an even habit of growth.

Professor Blair, who will speak this afternoon on seed selection will probably tell us of experience obtained in regard to securing and maintaining these desirable characteristics, and I will therefore say nothing on this point.

I would, however, throw out the warning that it may not yet be definitely proved that the stamina of a variety can b eindefinitely kept up by planting the tubers, that is, that it may be a possibility that we must return to the planting of the true seeds of the potato plant to be sure of maintaining the vigor of our plants.

Our experience thus far on the Experimental Farm would seem in some measure to corroborate this claim, for the ten rows of seedlings grown in 1915, four years from the seed of the potato balls, certainly contained the most vigorous and disease resistant plants in our whole field. In 1915 we planted 300 hills of tubers that had been grown from seeds in 1912 by Dr. Seth Whitney, of St. Stephen. These tubers were little rough tubers of various shapes with deep eyes, some black, some white, some various combinations of black and white, but none red or pink. In the fall these hills were all dug separately and each put in a bag, the tubers being larger and better shaped than the tuber planted. In 1914 thirty hills were selected and six hills were planted from the best tubers of these thirty selected hills. These were also kept separate when dug, and the tubers again were larger and generally more shapely than the tubers planted. In the spring of 1915 these lots were gone over carefully, the ten best lots were selected and 100 hills of each planted—eight white strains and two dark. These yielded:

No. 1 Black, 76 bbls. per acre.
No. 2 White, 99 bbls. per acre.
No. 3 Black, 88 bbls. per acre.
No. 4 White, 99 bbls. per acre.
No. 5 White, 105 bbls per acre.
No. 6 White, 106 bbls. per acre.
No. 7 White, 96 bbls. per acre.
No. 8 White, 109 bbls. per acre.
No. 9 White, 99 bbls. per acre.

Ever since we began growing these seedlings, the tops have been an especially dark green, the plants strong and vigorous in every way and very free from any disease of either leaf, stalk or tuber. Our experience, therefore, as above stated, seems to corroborate the theory of the men who claim that potatoes should be rejuvenated by breeding over from the seed balls.

As to a choice between varieties, it seems to me to be rather a choice of type than variety.

For our present market demands, a white skinned, smooth and short oblong tuber such as the Green Mountain seems to be the type preferred. A round potato like the Cobbler also goes well. There is one difficulty about these shapes that meet the cook and that is, that when the potato grows large it is too thick through to cook quickly and evenly, and in the case of the Cobbler is very apt to be hollow hearted. Therefore, to have a thoroughly satisfactory market potato of these short types, it is essential that they be not overgrown.

With this proviso, I think experience shows us that Green Mountains and Irish Cobblers are two outstanding varieties for first choice.

Of these varieties, we have had the following yield on our test plots:—

	Av. 2 years bbls. per acre.	Av. 3 years bbls. per acre.
Green Mountain — Ottawa strain	116	104
Green Mountain — P. E. Island	130	108
Green Mountain — —N. B. strain	147	136
Average of 3 strains	131	116
Irish Cobbler — Nova Scotia strain	144	
Irish Cobbler — —Ottawa strain	152	
Irish Cobbler — —Saskatchewan strain	163	
Irish Cobbler — P. E. Island strain	145	
Average of 4 strains	151	

Our system is to plant 12 in. apart in the row, with the rows 30 in. apart. We had no over-grown tubers, and their quality was very satisfactory.

These two varieties belong to different types, and I will just briefly compare some of our other varieties of these respective types. Take first the Green Mountain type and we have of these:

	Av. 2 year bbls. per acre.	Av. 3 years bbls. per acre.	Yield, 1915, bbls. per acre.
Delaware	129		123
Carman No. 1		127	
Empire State (Av. of 4 strains)	123	109	92
Clyde	155	135	95
Gold Coin	126	107	72
Green Mountain Jr.	106	94	69
Norcross	93	89	79
Snow	122		
Cumming's Pride			93

A division might be made to take the Carman and Gold Coin, for in my judgment they should be a flatter and smoother finished potato than the other varieties mentioned. And to my mind, the Empire State belongs as much to the Burbank type as the Green Mountain.

The Cobbler Type.

While there are a number of American grown varieties of this type, there is only one we have tested at the Fredericton farm. It is the Eureka Extra Early, and we have found it a high yielding and desirable potato. The average yield for two years was 158 bbls. per acre, and for three years 130 bbls., showing a higher yield than two of the Cobbler strains. Some authorities claim it is the same potato as the Cobbler. An American variety, known as Dreers' Early Standard is also almost indistinguishable from the Cobbler.

The Triumph Type.

The shape of the tuber is much the same as the Cobbler, but the color red, or solid red. The Noroton Beauty, Quick Lunch and White Triumph are all varieties with these characteristics, but the variety we know most generally in New Brunswick is Bliss Triumph or Red Bliss. It is a solid red, vigorous potato, and at Fredericton has given us the following yields:

1914, 152 bbls. per acre.
1915, 140 bbls. per acre.

This potato is in good demand most years for seed for the Southern States, as with the Garnet Chili it is among the most popular early potatoes on the New York market.

The Scotch and English Type

There have been in the last ten years, some very excellent varieties brought to New Brunswick from Scotland and England. The varieties which we have tried out at the Experimental Station are practically all of one type and are mostly good yielders of excellent quality. Among them are the following:

	Av. 2 year bbls. per acre.	Av. 3 years bbls. per acre.	1915 bbls. per acre.
Dalmeny Beauty (Av. of 2 strains	127	110	76
Dalmeny Beauty, Dalmeny Hero, Ot'wa	139	123	90
Dalmeny Regent Ottawa	119	119	118
Factor (Av. 3 strains)	96	91	79
Table Talk (Av. 4 strains)	142	127	98
The Moreton	128	117	123
Up to Date	103	99	89
Scottish Triumph	117	106	86

These potatoes are all white skinned and very similar in shape, somewhat oblong, rather flat, the seed end somewhat like the small end of an egg and smooth with yellow eyes. From their shape, they are probably better cooking potatoes than the Green Mountain type.

The Burbank Type.

These are an oblong cylindrical white potato of good quality. The varieties which have been tried out at the Experimental Station are:

	Av. 2 year bbls. per acre.	Av. 3 years bbls. per acre.	1915. bbls. per acre.
Burbanks Seedling	141	106	93
Money Maker (Av. 2 strains)	127	119	104
White Chief	129	118	97
Vick's (Av. 3 starins)	133		
Vicks' (1 strain)	147	134	107

Vicks', planted in a seed plot in 1914, gave 338 bbls. per acre. by far the best crop of potatoes I ever saw. Unfortunately the seed plot from the seed of this crop was flooded out in 1915 and no results were obtained. On a small portion where the plants were damaged, but not killed, the yield was at the rate of 127 bbls. per acre.

The Rose Type.

This type was popular years ago, but to-day the pink potatoes are not sought on the market, and perhaps the general quality of potato of this type is a good reason for their decline in popularity.

The Early Rose was long the reigning favorite of these potatoes, but it has been dropped almost completely. The following are the varieties tested at the Experimental Station:

	Av. 2 year bbls. per acre.	Av. 3 years bbls. per acre.	1915. bbls. per acre.
Early Rose	91	76	75
Early Norther	128	122	109
Rochester Rose	126	108	73
Everett	96	86	92
New Scotch Rose	102		99
Houlton Rose (said to be simply an early strain of Early Rose)	170	143	93

The Hebron Type.

These potatoes apparently differ only from the Rose type in their color. Sometimes their quality seems to be better, but they have no popularity on our markets. The varieties tested were:

	Av. 2 year bbls. per acre.	Av. 3 years bbls. per acre.	1915. bbls. per acre.
Early Beauty of Hebron	153	136	100
Early Bovee	116		
New Queen	96	92	85
Queen of the Hebron	43		

White Elephant, not now grown, but an old heavy yielding variety usually of better quality than the others mentioned. This variety might go perhaps, with some reasons in favor of it, with the Burbank type.

The Peerless or Rural Group.

	Av. 2 year bbls. per acre.	Av. 3 years bbls. per acre.	1915. bbls. per acre.
Carman No. 3	146	125	83
Peerless			
Rural New Yorker	125	112	87
Sir Walter Raleigh	137	121	89
Prolific			

The Peerless and Prolific are old varieties that were grown in the lower St. John River Counties consider-

(Continued on Page 470.)

Potato Improvement and Seed Selection

This subject opens up a very broad and many sided question. I do not propose to deal with the question of improvement fo the potato through the development of new varieties. I fancy the object at the present time is to set forth methods whereby we may hope to keep the varieties we now grow up to their fall vigour. I think there is sufficient evidence entirely trustworthy to convince us that there is no decline in a variety due to old age. Without a doubt a variety will deteriorate under certain climatic or soil conditions, or owing to a disease which prevents normal development, but because such is the case is not evidence that the variety has "run out," it only proves that the variety has been surrounded by conditions unsuitable for it to retain its former vigour. The question therefore is not so much the introduction of new varieties—although the introduction of disease resistant varieties is important—as it is the keeping of present good varieties up to a certain standard of excellency particularly as to vigour.

Some of our growers of the Garnet Chili potato say that this variety has "run out" and they wish they could get a variety that would yield like the old Garnet Chili. On talking to other growers I found that they considered the present Garnet Chili equal to the first introduced stock of this variety. This variety, owing to the fact that true seed could be secured from different growers—which is not the case with many of our white varieties—offered a good opporunity for some experimental work to find out whether there was a difference in the stock grown by different men. We were also interested in the work because the Garnet Chili shipped from Nova Scotia to Bermuda had in some cases given very inferior yields, and we wished, if possible, to find out the cause.

This variety was secured from eight different growers and planted in rows alongside each other under exactly similar conditions. The results at harvest time were as indicated in the table below.

Garnet Chili Potatoes From Different Growers.

Number of grower	Marketable bushels	Unmarketable bushels.	Total bushels.
1	220	20	240
2	94	26	120
3	212	14	226
4	186	20	206
5	26	10	36
6	32	14	46
7	176	34	210
8	52	22	74

You will see that the lowest yield was 36 bushels per acre and the row adjoining yielded 206 bushels. It seems reasonable for the man who was growing Chili potatoes from seed lot No. 5 to think this variety had "run out," and also for the man who was planting No. 1 to consider the variety was as vigorous as ever. Seed from these plots will be again planted to see whether they can be brought up to a uniform yield.

Now the question is what has brought this change in these various seed lots. There is no doubt but that seed selection has played an important part, but it can be truthfully said that no hill selection had been practiced, and if it is the case that hill selection only is of value we will have to consider that selection has not been a factor in bringing about the results here shown. In the case of grower No. 3 I know he has been careful to plant only uniformly good, medium size, tubers of this variety, and he has always taken his seed stock from the best dug areas.

At planting time when placed together there was a noticeable difference in the different lots, but they would all be considered good seed stock. The difference here shown would not, I think, have been so marked had the soil in which they were grown been free from the disease called Rhizoctonia, commonly known as "Rosette" or "Little Potato. The soil at the Kentville Station even on the newly broken areas apparently has this disease in it. Our soil is decidedly acid, a condition suitable for holding potato scab in check, but one decidedly favorable for Rhizoctonia Sandy acid soils are apparently most suitable for the development of this disease and there is no doubt that the disease is more prevalent in some soils than others.

The growth started on plots 5 and 8 and in many cases the sprouts were not able to get above the ground before being killed by the fungus. An examination of the tubers revealed the fungus destroying the sprouts soon after they started, and below this diseased area new sprouts would start which would meet a similar fate. In many cases the sprouts would succeed in reaching the surface before being attacked as indicated by discolored areas along the stem below the surface of the ground which would ultimately kill the stalk or materially reduce the power of the plant to function properly. I have here several specimens of this disease in the various stages as produced in our greenhouse which you can examine. These specimens I think clearly indicate the condition that existed on the poor plots. The strong growing plots such as No. 1 and 3 were very free from injury, and this seemed to be due to the power of the growing sprout to resist the disease because of having the vitality to force the growth so rapidly that the fungus could not break down the tissue. The buds were strong, grew rapidly, and where the stems were injured they seemed to outgrow the injury somewhat unless it happened that the stalks were entirely girdled. Had those potatoes been planted on a soil entirely free from this disease. and had the seed been treated to kill any of the disease carrying bodies on the tubers, I am sure that the results would have been much more uniform, but under the conditions that existed, and conditions that are liable to obtain on 50 per cent of our farms, the only hope for success apparently is seed stock of high vitality.

Now you ask what has brought about this low vitality to start with? Suppose for instance that the plot yielding 240 bushels per ace had been grown for years on soil practically free from this disease is it not reasonable to suppose its vitality would be stronger than that from the field which year after year had been subjected to even a moderate attack of this disease. This disease certainly hinders normal development, hence a weakened plant must result. If. therefore, such a disease gardually weakens a plant it is reasonable to suppose that a dorught, intense heat or excessive moisture will bring about similar results. It seems to me we are bound to have a fluctuating variation in the vitality of tubers owing to environmental conditions, and any condition which is likely to give most normal development from the time the set is planted to the maturity of the crop will give us the strongest vitality. On the other hand my observation leads me to believe that a check during the early life of the plant--about the

HAVE AN OUTSIDE INTEREST

Speaking at the Sixth Annual Dinner of The Harvester Club on February 3rd of this year, Dr. Henry B. Favill, who was guest of honr on that occasion, said in part:

"The thing which becomes an interest to us is the thing into which we put our intelligence. The fact is, gentlemen, that circumstances never have any intrinsic, pleasurable quality of circumstances is dervied from what we put into them, not from what we take out of them. There is no question about it. So I am urging upon you as a general proposition to have interests really definite, consistent interests, that you may reasonably and honestly call intellectual interests, in some subject or other outside your business.

"The other day in talking to a friend about various public activities in which we had been engaged together, he said, with some feeling of discouragement: "There is nothing difficult about this matter if you can get the ear of honest men." He was referring to municipal affairs, to a number of situations that are important. To that I would like especially to call your attention.

"The obligation that rests upon all men who are in dignified employment, men of respectable connections, of elevated business ethics, is to take part in their community life. Do you do it? Some of you, I know, do it tremendously. Many of you, would if you just knew how. I venture to say, however, that in the minds of this splendid body of men here tonight there is not the conviction regarding this ethical relation to community affairs that there should be. Think that over. Let me say with all the emphasis I can that every unit of good that you can confer on the community by participating in its affairs will be returned to you in personal reward tenfold through the interest that will come to you from an intelligent understanding of the needs of your community.

"We live in a wonderful country, under a wonderful government, complex, ramified, intangible and rather loosely knit. None of us knows definitely much about affairs outside his business—particularly the social and political affairs around him. In the light of the turmoil which now exists in the world; with the internal trepidation everyone of us feels as to what is next; with the serious thought that a large percentage of the men here tonight may never meet again if things should go from bad to worse during the next two or three year—with this in mind I ask you, gentlemen, earnestly to answer to yourselves the question: "What are you doing toward the stabilizing of your government—not your national government only but your state and municipal government?" Your answer may be: "What can I do? What influence have I in muncipal affairs?" Let me assure you that the one force which is of the greatest consequence in the United States, the on force that can be mobilized to great advantage, is public opinion, is independent thought, is an intelligent understanding of the issues, be they national or municipal. Therefore, in the name of all the organizations that are reaching out for an honest public opinion, I urge you to realize that every one who interests himself intelligently about his municipal affairs, thereby determining what his ballot shall be, is rendering yeoman service on bhalf of his country.

"Bear in mind, gentlemen, that there are a thousand ways in which you can bring yourselves into this relationship. There are the ways of philanthropy, the ways of civics, the ways of politics, the ways of all kinds of activities. It is not the specific group that you join; the point is to join some group which has for its purpose an intelligent understanding of the problems before us as a people and a determination to do its best, whatever it may be, toward the solution of those problems. Never in the history of this country has it been so imperative that every honest, able-bodied, red-blooded, clear-thinking man should have his mind set on what is the right thing for him, for his community and his country to do. This matter does not necessarily turn upon your expression of opinion. It turns finally upon the clarity of your thought. You can't have a clear thought without an outstretching into the matter that will give you a cerain kind of exact knowledge. You can't have an exact knowledge unless you study—unless your think. You cannot very well study this subject unless somewhere or other you get into such a group as I have mentioned.

"I began by speaking about your individual happiness because I know that anything you can do along this line will redound to your individual happiness, but aside from that, and beyond it, I say to each one here tonight, with all the earnestness that I can bring to bear, and quietly and seriously: your country needs you, needs you more than it ever needed you in its history."

Since the above paragraphs were spoken, Dr. Favill has gone to his reward and his kindly deeds to humanity will long be remembered. What a great epitaph for any one's memory is embodied in the following paragraphs.

* * *

"His stalwart physical frame was dominated by his splendid mind. In every attitude and attribute he gave evidence of power; and it was power fitly used for the good of his fellowmen. Many hours taken from his busy professional life were spent in efforts to correct the shortcomings or worse of government and political conditions. His great force of character, his independence of judgment, courage of conviction; his noble disinterestedness, his tender-hearted sympathy were freely given to his friends and the community. No man was too humble, and none too mightly for his service.

* * *

"Taken in the midst of his career, we cannot feel that his work was done. He was the type of manhood for young men to emulate, and older men could profit by his example.

* * *

"Few men have such outstanding qualities as to be long missed in the busy life of the world; but here was one of such conspicuous value that it seems the gap of his passing can never be filled."

* * *

What an impetus the foregoing should be for all those who are conscientious and whole souled in their efforts for the advancement of community interests.

ONLY A FARMER

Thank God for our farmers, they are His co-operators. In looking over the Senate Debates of March 30th we naturally paused and read a while when we arrived at the section dealing with the "escape of Alien Prisoners from Detention Camp at Amherst. Having heard practically all the rumors current in regard to the event in question we were considerably interested in the report of the inquiry.

The attitude of some of the speakers who took part in the discussion was, to say the least extremely childish and time-wasting.

A straight forward question such as had been asked re the necessity of an investigation of such serious reports as were current re the escape of the alien prisoners at Amherst demanded and merited a straight forwad reply. Instead of the latter was the most absurd technical obstacles introduced and a lot of time and word wasting discussion. What riled us the most, however, was the epitaphs that some of the honorable gentlemen who took part in the discussion applied to each other whenever one wished to represent the other as crude, the epitaph applied was the word "farmer" used in a depreciatory manner.

For the education of the various members of the Senate body who expressed their ignorance in this way we wish to tell them that they are many years behind the time—that people who know now-a-days instead of holding the farmers and their occupation up to ridicule uphold their calling and rightfully so as the most honorable occupation in which any man be employed. Our farmers, however, are not entirely free from blame in their matter when they allow themselves to be represented by men who do not know any better than indulge in a depreciatory ridicule of their noble calling.

After-a-while is a luring road to not-at-all.

* * *

In these times farmers have to look ahead and look alive.

* * *

It pays to advertise if your line is good, and it pays to buy advertised lines, because they are invariably satisfactory. The general public have long been educated to believe that advertised goods are best. Can't you see that you are laboring, not only under a handicap, but under a cloud, if your product is not advertised? Publicity dispils the cloud of suspicion and removes the handicap.

The Home Vegetable Garden.

(Continued from Poge 449.)

than the man, hence the importance of placing it within easy reach of the rear of the house so that it can receive the attention of the women of the house. I want to say, however, that we owe it to our families, to the boy and girl particularly, to start a hotbed. It is a potent factor in the development what makes for good citizenship. Its calue cannot be measured in dollars and cents, and the man who fails to help out in this particular is not living up to his opportunities. The old excuse of not having time does not hold in this case. The truth is it is a lack of interest in one of many things which goes to make life on the farm worth while.

It is not for vegetables alone that we want a hotbed, but there are many annual flowering plants which can be started that will go a long way toward making the home attractive, and not only gives pleasure to the inmates of the home, but they give pleasure to all those who come in touch with that home.

FLATS.

The word flat is used to designate a shallow box. This box may be any size desired but should not be deeper than 3 inches. The flat should not be too large. Twelve by eighteen inches is a good size, and it can when filled with soil be easily handled by a woman. Two and a hald inches depth of soil is sufficient to grow any plants in for setting out. It is best to use 1-2 inch lumber for sides and bottom and 3-4 inch ends. The bottom should not be tight thus giving drainage. Soap boxes, packing cases in fact any such lumber makes excellent flats. It is a good plan to make the flats of one size in order to make the best use of the space in the hotbed.

The advantage of the flat is that seedlings start better in them than in soil in the hotbed. They can be moved from place to place. The bed can be opened a flat taken to the kitchen the plants transplanted to other flats where it is warm and the flats carried to the hotbed again. Less soil is required. As the plants get larger and ready for hardening off they can be left outside or put into a cold frame and the space in the hotbed given to other plants. When transplanting time arrives the plants can be carried to the field and with a knife the soil is cut out in squares and the plant set to the open ground with little check. In fact in every way the flats are desirable and will materially add to the success of the grower. Usually the first interest awakened in the boy and girl in regard to pleasures in farm life centres around the handling of garden plants, and it is well that we see to it that a few plants are well grown rather than that many should be poorly grown. The flat helps in the growing of good plants and the work of putting together a few flats is not very great.

STARTING THE SEED.

The smaller the seed the shallower the depth of planting. The small seed such as celery should be covered about one-eighth inches deep, and cabbage and onions one-quarter inch. Moisture is essential to good fermination and as the germinating seed is confined to the top thin layers of soil it is necessary that this should be kept always moist. It is advisable that a paper be spread over the flat of newly planted seed to keep the soil from drying out rapidly and save so much watering. This covering should be removed as soon as the young plants appear; to neglect this will spoil the plants in a short time. It is a good plan if the sun is very bright to lay laths on the glass spaced one inch apart to give a partial shade yet furnish the desired sunlight.

Every care should be given to the watering of the seedlings for the week following their germination, and at this time do not overwater. The advantage of a partial shade is that less drying out of the flats will take place. The higher the temperature the quicker the germination, however, too high a temperature may force the germination and give weak plants. It is well therefore to give moderate temperature conditions. Poor germination often results from drying out of the suraface soil, hence the importance of giving attention to this detail. Excessive moisture with a low temperature favors rotting of the seed, and the lower the temperature the less the watering required.

The soil should be put into the flat so that it will settle uniform and should be slightly packed particularly around the edges of the flat. The soil may be screened and the rougher rougher parts placed in the bottom and the finer on top. It is not necessary, however, to screen the soil if it is well worked over by hand. If the soil is heavy sand should be added to lighten it some and the covering for the seed is better made up of half sand and half soil. The seed may be scattered broadcast or put in rows and after it is covered press the soil around the seed as this gives better surface moisture conditions.

If the hotbed is kept closed and the air charged with moisture there is a possibility of the damping off fungus getting started. This fungus causes a rotting of the plants at the surface of the ground. Plenty of ventilation is the best way to guard against this trouble. Seedlings particularly are liable to injury and if this is noticed give less water and ventilate more freely.

For the average farm a hotbed of two sashes say 6 by 6 feet will give what plants are required. It is better to put up a bed for one sash than to be without the hotbed.

COOL AND WARM SEASON VEGETABLES.

Vegetables can be conveniently divided into two classes in regard to their temperature requirements. The cabbage, lettuce and onion do not need as high a temperature as tomatoes, squash or melons. It may be desirable therefore to make a division in the centre of the hotbed with a board thus enabling one to carry the heat loving plants at a higher temperature. It will help materfially in starting plants to consider the heat requirements of the plants grown.

EARLY CABBAGE AND CAULIFLOWER.

The Cabbage and Cauliflower for early crop should be started the last of March or early in April. In two weeks time when the first true leaf appears the plants are ready for pricking off into flats, about 2 inches apart each way, where they remain until set to the field early in May. The cabbage and cauliflower are cool season vegetables and can be set to the open as early as the ground can be worked. There is no great gain, however, in setting poorly developed plants to the open early, and unless they are well hardened off by allowing the flats to remain in the open for a week before transplanting they will suffer considerable check. It is better, therefore, to let the plants grow under good conditions and thereby develop better plants for setting out toward the latter part of May. The plants should have five weeks' growth at least from seeding before planting out to get thrifty plants.

The Copenhagen Market is hardly as early as the Jersey Wakefield, but it is a much better sort and forms a round solid head. Plants from seed started March 28th and priceked off April 10th were set to the open ground May 8th and gave marketable heads July 22nd weighing three pounds each.

Cold weather may come on after the early planting in May and the plants may take on an apparently stunted growth, but during this time the roots are becoming developed in the soil and when more favorable weather approaches they grow rapidly. A frost does not injure the plant if it is established in the soil. For early cabbage, therefore, let us get the seed started now.

The Cauliflower can be grown in the same way, and if given the same treatment will give fine large heads in July.

The root maggot has caused much disappointment to the grower of early cabbage and cauliflower. About the time the plants are making strong growth in June they commence to wilt and an examination of the roots reveals the cause of the trouble in the form of a white maggot which eats the tissues of the root at the base of the plant. This maggot develops from an egg laid by a small fly the latter part of May or early in June at the surface of the soil around the base of the plant. To prevent this tar felt discs are placed snugly around the plants right after they are set. The discs are made out of tar paper about 2 1-2 to 3 inches in diameter and a slit is cut ont half way toward the centre with a cross out at the centre of one-quarter inch to allow for the plant. The disc is so placed that it forms a collar around the base of the plant in the centre. This if carefully put around the plant at the surface of the ground keeps the fly contact with the soil and rather than deposit her eggs on the tar paper she will go to some other plants. If early cabbage are hoped for do not neglect the tar felt discs. It is only a short job to make them, and over 80 per cent of the cabbage can be saved from this troublesome insect by them.

The Eufurt cauliflower is the best variety to use. Cover the seed about one-quarter inch deep. The plants are a little more delicate than the cabbage and if the plants suffer a check from careless transplanting they may not from good heads. Examine the roots of the seedlings when pricking them into flats as sometimes the damping off fungus may cause injury to the outer tissue at the base of the plant in which case this part will be black and a poor plant will result.

EARLY LETTUCE.

Early lettuce can be had by starting the plants at the same time as early cabbage. The plants can be set to the open ground any time after the first week in May and it requires five weeks to grow good well hardened plants. Like the cabbage the early seeded well developed are necessary for early lettuce. It is also desirable that the plants be once transplanted into other flats as is the case with the early cabbage to get a compact root system which will start well under favorable soil conditions in the early spring.

Seed of Grand Rapids, one of the best open head varieties started in flats March 28th pricked into other flats April 14th and set to the field May 9th produced heads averaging in weight 1 pound 3 ounces on July 2nd. Whereas seed sown in the open ground May 14th and thinned to 6 inches apart produced heads August 4th weighing 15 ounces.

The All Heart is one of the best cabbage head varieties. The Hanson Improved is also a good one.

The All Heart planted as indicated for Grand Rapids gave heads on June 27th and July 2nd averaging 15 ounces and seed started in the open ground May 14th gave heads weighing 13 ounces July 28th.

ORDERING VEGETABLE SEEDS.

To decide what varieties of vegetables to order is often very difficult. One can in a measure decide from a seed catalogue, but as a rule they are rather confusing and possibly a list of those found to be the suitable will be helpful. We therefore will submit the following list as being quite suitable:—

Lettuce: Grand Rapids, Hanson Improved and All Heart.

Cabbage: Copenhagen Market and any of the Drumhead sorts for late and Danish Roundhead for winter storage.

Celery: White Plume for very early. Paris Golden for general crops and Winter Queen for late storage.

Cauliflower: Early Erfurt.

Onions: Globe Danvers, and Prize taker. For seeding outside Extra Early Red.

Tomatoes: Earliana and Bonny Best.

Peas: Thomas Laxton and Gradus for early and Stratagem for late.

Beans: Wardwells Wax. Stringless pod and Refugee or 1000 to 1.

Cucumbers: White Spine.

Carrots: Chatenay and Danvers.

Parsnip: Selected Hollow Crown.

Spinash: Bloomdale.

Radish: Ne Plus Ultra and Icicle.

Parsley: Champion Moss Curled.

Corn: Early Malcolm, Early Cory and Golden Bantam.

Beets: Selected Globe.

Squash: English Vegetable Marrow, Hubbard and Boston Marrow.

Pumpkin: Small Sugar.

TOMATOES.

Tomatoes require a high temperature and come into the warm season class of vegetables. It is not possible to plant out to the open ground until the first week in June. Six to eight weeks is required for developing good plants. If plants are carried eight weeks care must be taken to give them ample room and proper attention, otherwise they may be drawn or spindling plants of little substance A short stocky plant kept growing at a moderate temperature and given plenty of room is required. It is better, therefore, if much space cannot be given to develop the plant in six rather than eight weeks. The plant, however, two months old at planting time if carried and handled without check will give earlier fruit. The date of planting will vary therefore from the first to the 2nd week in April.

The seed should be started in flats, and when two to three weeks old are set to other flats 4 to 6 inches apart. It is better to give 6 inches, putting 6 plants in a 12 by 18 inch flat. Strawberry boxes are good for this work placing one plant in a box. Put a piece of birch bark or something similar in the corner of the boxes to prevent the soil from washing out thus making it difficult to water the soil in which the plant is growing. When ready to plant out the box is cut and the plant does not suffer a check from the soil having been disturbed. Aim to keep the plant in a vigorous healthy condition by giving plenty of ventilation and do not force growth too much but rather develop a sturdy plant which will stand upright when set out. In many cases transplanted plants are not satisfactory because they have been grown under high temperature conditions and when placed in the open suffer a decided check. See that the plants are well heardened by leaving them in the open during the last week particularly during the day. It will be seen, therefore, that to handle plants in this way more time than usually given for their development is necessary.

If space is lacking the plants may be first transplanted three inches apart and later set to the greater distance. The transplanting gives a more compact root system and the plant will as a result do better when set out.

The Earliana is without doubt the earliest variety. The Bonny Best is a little smoother and a little later. The Early Jewel is a good later sort.

HORTICULTURE.

Canada's Insect Destroyers

The Woodpecker and Chicakee are Especially Active in Trees and Foliage.

Canada's bird visitors are rapidly returning for the warmer season, and we may again look forward to their assistance in the destruction of caterpillars and insects, so destructive to our trees.

One of the most important of these birds is the woodpecker. It feeds on larvae and small insects, which are found in crevices of the bark; securing them with its protrusible tongue. This tongue is sharp, hard at the end, can be directed backward, and can be extended several inches. The red-headed woodpecker, besides digging insects out of the bark, seizes them on the wing. In the examination of over 700 stomachs of woodpeckers, animal food, mostly insects, was found to constitute 76 per cent of the diet. The animal food consists largely of beetles and caterpillars, and includes many harmful species.

The chickadee is another of our most active insect destroyers. It is especially active in the vicinity of any timber or wood chopping. The birds will become very familiar, and will readily make friends. Not being equipped, as the woodpecker is, with a long bill, they take advantage of the cutting of cordwood, etc., to secure the grubs found under the bark or exposed in the cutting. As a rule, however, they feed upon the insects of th orchard, the bush or shrubbery.

The woodpecker and the chickadee are only two of the many birds which are of great service both in the city and country, and it is surely not too much to ask that people give them the necessary protection to allow them to continue their invaluable work.

Cover Crops

Every well cared for orchard should include in its management the use of cover crops. These consist of crops which may be sown in the fall or late summer among the trees, which remain on the ground through the winter and are ploughed under in the spring. The practice of growing cover crops in the orchard is not a new one and can well be given greater consideration among the fruit growers.

Cover crops have no particular place in orchards that are left in sod or possibly ploughed in the spring, harrowed once or twice and left to grow up with grass and weeds. Neither have they any place in the management of orchards where the mulch system is in use, but are especially adapted to methods of clean culture.

Cover crops have a number of things to recommend them which are of considerable importance to the orchardists. Among these may be mentioned the following:

1. They check the late fall growth of the trees by utilizing the surplus plant food.

2. Help to prevent deep freezing of the ground by retaining the snow during the winter.

3. Utilizes plant food that becomes available late in the fall, and that would otherwise leach out by the rains.

4. Adds humus to the soil when ploughed under in the spring.

5. Helps maintain fertility and increases the moisture holding capacity of the soil.

6. If the cover crop is a legume, it will tend to increase the fertility of the soil.

7. Helps to prevent the washing of the soil on side hills.

These cover crops should be sown in late summer, after the trees have made the desirable amount of growth, usually in August. The seed are scattered broadcast and worked into the soil at the last cultivation. They are allowed to grow as much as they will until the following spring, when they are ploughed under.

There are a number of different kinds of successful cover crops, such as buckwheat, oats, vetch, clovers, winter rye, winter wheat, field peas and essex rape. These may be used singly or in combination. A good plan is to use two kinds, one resistant to frost and one easily frozen. Such combinations as buckwheat and winter rye, or oats and rye, or essex rape with winter rye, would work successfully. The buckwheat would come up quickly, thereby taking food away from the trees to check their growth. The winter rye would come on slowly, and when frost cut the buckwheat, would take its place remaining on the ground over winter. The vetches are good, but the seed rathe too expensive. The same is true of field peas. Clovers may be used, but their growth is slower and there will be less to turn under in the spring.

Where any of these crops are used alon, the quantity of seed sown should be the same as when sown for a crop in the open ground. Where combinations are used, a little more than the usual proportion of each would be desirable. Where two are used, 60 per cent of the amount of each where grown alone; where three are used, 40 per cent of each. This method would add from $2 to $3 per acre to the cost of the ordchard each year, but would return profits in fruit many fold.

B. S. Brown,
Professor of Horticulture in Maine Farmer.

Experiments in Europe on the Selection of Seed Potatoes

The following points were studied experimentally:

(1) The influence of the size of the tuber upon the yield.

(2) The comparative yields of 1 gr. of seed potato substance in tubers of different weights.

(3) The influence of the size of the tubers upon the number of potatoes harvested.

(4) Whether the size of the tuber has an influence upon the average weight of the tubers of the crop.

(5) The yield of the tubers in proportion to that of their parents, or in other words, how far the effect of heredity is observable in the crop of tubers.

(6) Whether the number of tubers and the weight of the tubers are hereditary characters in the potato.

(7) The result obtained by planting two tubers in the same hole.

For his experiments, which extended from 1908 to 1913, the writer used three varieties of potato "Sechswochenkartoffel," "Eierkartoffel" and "Up to Date," which were planted according to the usual method.

For comparison, tubers taken from plants of the same pedigree were used.

The results of the experiments may be summarized as follows:

(1) With the increase in the size of the tuber the crop increases more than is generally supposed. The greater cost due to using larger tubers is better repaid by early than by late varieties. When the tubers regularly used for planting are larger than the average potatoes harvested, the advantage of selecting the seed tubers is much less than when the tubers are smaller than the average potatoes of the crop. The advantage of a large seed potato is greater in soil that is little or not at all, manured, than in the case of well manured soil.

(2) The larger the seed potato the smaller the yield in proportion to 1 gr. of seed potato substance. If, there-

Get This Power Sprayer

For 30 Days FREE TRIAL

Use it for your First Spray and if Not Satisfactory, we will Take it back and No Expense.

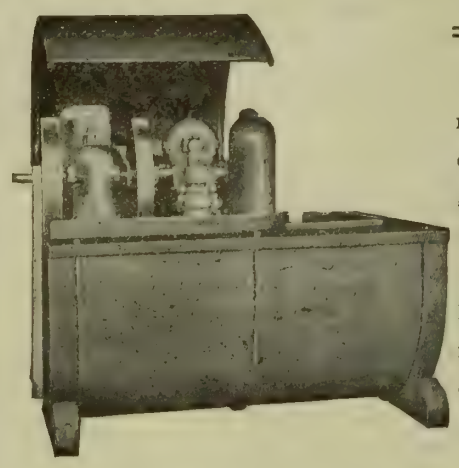
Each machine guaranteed for 2 years against REPAIR.

Each machine will handle 2 lines of hose at 250 lbs. pressure, deliver 6½ gals. mixture a minute and easily apply from 1200 to 1500 gals. a day.

Engine can be instantly released for other POWER PURPOSES, such as sawing wood, etc.

Engine parts interchangeable with "Ford" motor parts. Therefore engine is standard.

I. X. L. JUNIOR Automatic Power Sprayer



The I. X. L. Junior is made in two styles. It consists of a 3½ H.P. Engine, cypress tank, gear driven vertical cylinder pump, two 25 ft. leads of Hose, two visible spray nozzles, complete in all details.

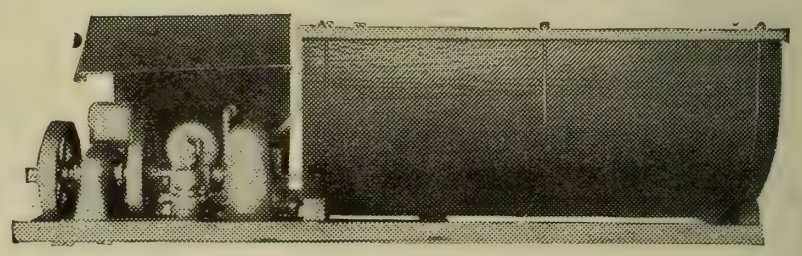
Weight, 450 lbs.

I. X. L. with 100 gallon tank, $165.00
I. X. L. with 150 gallon tank, 170.00
I. X. L. with 200 gallon tank, 180.00

For rough or hilly orchards, common in some parts, the machine which best fills the requirements is our back-mounted.

Pontiac Special

Automatic Power Sprayer



This machine is equipped with the same engine as the I.X.L., and is made with two size tanks.

150 Gallon Tank, 50 ft. Hose, 2 poles $200.00
200 Gallon Tank, 50 ft. Hose, 2 poles $210.00

We have prepared a valuable booklet entitled, "Prize Fruit and Vegetables from your Orchard and Garden," which is free to all farmers, fruit and vegetable growers. Use the coupon and send for your copy to-day.

SHAW'S SCHOOL, Toronto, Canada
W. H. Shaw, Pres.

fore, it is necessary to economise seed and the farmer has sufficient land at his disposal, small tubers may be planted with advantage.

(3) The greater the weight of the tuber planted, the larger is the number of tubers on the plant produced.

(4) A large seed tuber usually produces small tubers and vice-versa.

(5) A tuber from a plant of large yield generally gives rise in its turn to a highly productive plant. Tuber yield is therefore a hereditary chraac ter.

(6) The number of tubers is a hereditary character, but one which is only observed on comparing, from the point of view of their yield, parent plants derived from tubers of the same weight. The size or weight of the tubers is not a hereditary character, and consequently it is not possible to obtain heavier tubers by selection.

(7) By planting two tubers in the same hole, no larger yield is obtained than if one is planted.—Bulletin of Foreign Agricultural Intelligence.

Nitro Culture

For a number of years the College of Agriculture at Truro, Nova Scotia, has been sending to farmers in the Maritime Provinces cultures of bacteria for treating the seed of Clover, Alfalfa, Peas, Beans and Vetches. Farmers who have not had success in growing any of this class of plants have been advised that the lack of success may be due to several things such as poor soil, lack of drainage, acid conditions, etc., but that it may also be due to the lack of the presence of those bacteria which are necessary to develop the well recognized nodules on the roots of these plants.

The results up to date have indicated that inoculation with these bacteria is almost indispensable in the case of Alfalfa. In the case of Red Clover, Alsike Clover, Vetches, etc., the inoculation has given splendid results in from 50 to 60 per cent of the cases. In the balance of the experiments no damage has been observed.

All of this points to the desirability of farmers who wish to get good stands of these leguminous crops to experiment further with nitro culture for inoculation of the seed. In order to make the experiment easily possible for farmers, the College of Agriculture at Truro are continuing to send out bottles of the bacterial culture containing sufficient material to inoculate 30 pounds of seed, for the nominal sum of 20c. A different culture is required for each plant, that is, Alfalfa, Red Clover, Alsike Clover, Peas, Beans, Vetches. Anyone who is interested in this work should correspond with the Principal at the College of Agriculture Truro, N.S.

An Everlastimg Hotbed Frame

As long as we used a hotbed frame of boards we had to replace it every few seasons, so we built one 16 feet long of concrete. The walls are four inches thick. We not only get better, thriftier plants, but can grow plants right out to the extreme edge of the frame. With board walls the edges always dried out and plants were not so thrifty. Then the concrete frame holds the temperature much more evenly and holds moisture beneath the glass frames much better. It was built at a cost of$3 or little more than the price of plank, and it will last as long as we shall need a hotbed. — George W. Brown. Hancock Co., O.

New Seed Oats
Bruce's New Leader

The first to produce 5 mature grains in a spikelet. It is medium early, ear thick set and spreading, grain plump, white, thin husk, straw strong, of fine quality. It will give a greater yield than any other cereal in cultivation, and is adaptable to any soil. Peck 75c., bushel $2.00 here. Postpaid, 25c. lb.

BRUCE'S CONQUEROR. A new variety from Northern Europe, very heavy yielder, straw is strong, of medium height, grain is plump, thin skinned, pearly white, and makes splendid Oat Meal. It is hardy and ripens medium early. Peck 40c., bushel $1.25 here. Postpaid 25c. lb., 5 lbs. for $1.00.

NEW O.A.C. NO. 72. A new variety, of exceptional merit, an immense yielder and of fine appearance. It is a branching White Oat, early, and the straw is good and strong, the hull is thin and the grain weighs well. Peck 60c., bushel $2.00 here. Postpaid 25c. lb., 5 lbs. for $1.00. New 2½ bushel cotton bags 30c. each extra.

Practical Gardening Tools

TOOLS like these will do all of the necessary work (except plowing and harrowing) economically, whether for home, farm or market gardens. You can plant certain crops close and straight, and work them close and safely, with wheel hoes. You save ground, save heavy investment for tools at the start and yet do the best kind of work with profitable results.

IRON AGE *Hand Seed Drills and Wheel Hoes*

Will sow, cultivate, ridge, furrow, etc. better than you can with any old fashioned tools and ten times quicker. Pushed ahead a step at a time, these tools can be worked by women, or grown boys or girls. We show here a few only but we make 38 styles and combinations from which to choose. Prices, $3.00 to $14.50. There are also many attachments for special work.

Ask your dealer to show them and write us for booklet "Gardening With Modern Tools." Also, for horse hoes, narrow and cultivators, sprayers, etc.

Big Profits in Strawberries

Properly taken care of an acre of Strawberries will return more net profit than any other acre on the farm, and net profit is what we are all after nowadays. Too many farmers have been content in the past to raise crops, the price of which barely paid for the cost of production.

Other things being equal, the bigger the crop, the bigger the profit, and the man that buys our plants is taking a sure step in the direction of a big crop.

If you are a new beginner in growing berries the most reliable variety you can try is the Senator Dunlap; if you are an old hand at the business you will know enough to set Dunlaps without advice from us. The price of our Dunlaps,—well rooted, big crowned fellows,—is $3.50 a thousand. $3.25 a thousand in lots of 5000 or over. We are also lisiting some promising new varieties. CATALOGUE FREE.

Breeding and Raising Dairy Heifers

Following is the paper read by Mr. W. M. Lea, at the recent Dairmyen's Association.

This subject is an old one, possibly the most ancient of all subjects discussed at dairy meetings, but however much may have been written or spoken on the question it is my opinion that the greater need of the dairy industry in this province today is "better cows" and whole herds of them. We have hardly started herd improvement in earnest, yet it is right and proper to cull out unprofitable cows when we prove them such, but little gain if we don't raise a better one to take their place; yet we continually meet farmers who admit that it is hard for them to raise good calves and to any observing person who travels this country this is only too true.

The foundation of the dairy industry is built on the kind of heifer calves we continually raise to renew our herds and to any who have thoroughly tested their flocks the difference in production of their cows is astonishing. We need only to calculate what the profit from our herds in a season would be, if each individual were the equal of the best cow, to realize how important a feature the breeding end of the dariy industry is.

Since the adoption of official testing in all breeds of dairy cows it is now comparatively easy to pick a sire that will likely produce good dairy cows.

A law of breeding is that like produces like, but there is a law of variation which occasionally contracts other laws, and while it is true that sires of any breed will generally transmit the characteristics of their immediate ancestors, up to the fourth generation, we quite often get freaks, a striking contrast to the parent stock, and my experience has been that these so called freaks or variation in type will prove os prepotent and as impressive as any other sire. I can call to mind several instances of inbreeding in horses, a standard bred stallion that had produced a large number of fast horses had a full brother who could neither show any speed nor in any one instance sire a trotter, he was a freak or the law of variation, but transmitted true to his type.

This being the case it behooves us to use great care in the selection of a dairy sire, and because a bull happens to be full brother to a proven breeder is no guarantee that he will do the same, good breeding bulls generally "look the part." Nearly all that I have known in the Maritime Provinces who were known as good show bulls or confirmed closely to the recognized dairy type have proven good breeders. To any experienced breeder a male as well as a female can have a milky look, and I do not agree with the extremists who say they do not care a snap for type in cows that the scales and babcock test is the only guide.

At the present time there is a craze for big records and a lot of breeding is done on paper regardless of how the animals may suit each other. Big records are good, but we want strong robust breeding animals as well, and for my part I want a nice looking cow (good cows have not got to be homely) a good looker will milk just as well and both she and her offsrpring will sell better, so in choosing a bull we want one from heavy producing parents and one of good size, strong constitutional vigor and that will class as a good show bull of his breed Such an animal will be pretty certain to transmit the best qualities of his parents.

Whereas if a bull of well bred good looking ancestors happened as is sometimes to be rough coarse and not of good dairy type, I would not use him under any circumstances as he would most likely produce his own peculiar type, and I know of many disappointments through dairymen buying an animal solely on the history of his ancestors' production.

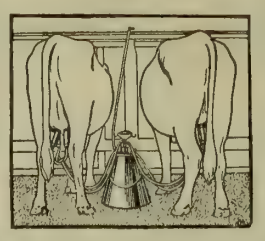
Now as it is evident breeding is something of a lottery it would be wise for dairymen whenever possible to try a proven sire. When a bull has proven through his producing daughters that he is an extra good breeder, he should not be sent to the block when still in his prime. I can call to mind several instances where superior breeders were sacrificed. "Sir Rooker Posh Artis" sire of "Miss La Honda" that made a world's record at the late Amherst dairy test, and also sire of many other noted producers and cows of superior type.

We secured him in a trade, used him as long as needed, and were then forced to sell him at the cheapest kind of beef price while yet in his prime, while at the same series of shows we sold some seven young bulls. A mature animal may be more trouble to handle than a younger one, but when we consider the great difference there may be in the cow sired by a proven sire over an untried one it seems the greatest folly to turn a superior animal down for this reason. A bull is no older than a cow of same age in any particular, and a good bull is easily half the herd. A cow howver good has but one calf a year, but the bull has every one in the herd, and many a breeder of pure bred stock has been brought into prominence and put financially on his feet through the fortunate purchase of one good bull. I have gone into this subject at length as I consider it a most important one, and from the enquiries we receive as breeders I think farmers in general do not lay strees enough on securing a good producer, as most enquiries will specify a particular age, mostly from one to two years old, I received an enquirey quite recently from an institute asking for two sixteen months old bulls, and while it may seen to be about the right age to buy (if they were correct in every other way) age is only a secondary consideration, and not comparable to producing ability in an animal, besides every man should know that they wont likely be able to get any breeder's best bulls at that age. First come first served, and the best bulls usually go under one year, so it will pay to buy early for this reason, or get a proven breeder which is the safest plan.

Then when a heifer calf from one of the best cows is born if you decide to raise it, decide also to grow it well and start right, give it whole milk warm as it comes from the dam until it has put on some baby fat. Don't wean until it would make good veal, then when you begin to feed skim milk, weigh or measure its feed and ning as is our practice with some older don't be too anxious to feed up to its capacity. Nearly all the trouble with stunted calves is brought on by indigestion through feeding too much skim milk. We now always weigh every calf's milk up to three months, its most important. Don't think you can guess near enough, you are almost sure to give enough at some time to cause scours and give your calf a set back that it may never fully recover from.

Prevention is a whole lot better than cure, in this respect see that your milk is always warm, as blood. If it gets cooled from any cause don't risk feeding it before warming, and place bran, crushed oats and a little oil meal in a box where the calf can get it all the time, it will learn to eat of its own accord as soon as it requires dry feed, especially if it is run-

Independent of Hired Men



That is the happy position of the Dairy Farmer who has an

EMPIRE MECHANICAL MILKER

In half an hour one man can milk from 10 to 15 cows with a small "Empire" outfit consisting of one double unit. One man can operate two double units. This makes milking a "snap".

With an "Empire" you can keep more cows—milk them regularly and uniformly—be independent of hired men—and still be free of the old-time drudgery of milking after a hard day's work.

The action of the "Empire" scientifically imitates that of a sucking calf, drawing the milk in spurts, and in most cases it actually increases the flow of milk. It cannot harm the cows, and it protects the milk from dirt, germs and stable odors.

We have an interesting Booklet illustrating and describing the "Empire" mechanical milker which we will send you on request. Write Dept. L

Your Cows Will Give More Milk

SUCCESSFUL dairymen have proved that stall-fed cows produce more milk when given a balanced ration containing the proper amount of protein.

Home-grown feeds lack the necessary amount of protein — your stock may be well fed and still be unprofitable.

S-W Screw Process Linseed Meal

is guaranteed to contain 36 per cent. of protein. Mixed in the proper proportion with home-grown feeds, it will increase the milk production of your cows to a greater extent than bran or mixed feeds.

S-W Linseed Meal is always fresh and rich, and makes the feed more palatable.—Write for prices and our free booklet: it tells how to feed all of your stock economically and profitably.

calves. Give it all it can eat of this up to six months, also good hay and pulped roots if you have them, then if you are careful not to overfeed or scour your calf with milk you can grow it as fast as possible on these feeds and have a calf at six months, fat, slick and in perfect condition. We don't expect to have our calves carry much flesh before this time. Skim milk is a splendid grower, and if you have it feed up to a year to a good calf, it will do then with less grain, but the most important period is from birth until three or four months. Get them growing steadily past that period without a knock down from scours and you can have a good calf on any kind of good feed from that on.

If you intend to breed to freshen at 24 or 25 months, you will have to feed very generously or your heifer will never attain her proper growth. It is a matter for each dairy man to decide at what age in his particular circumstances he had better have his heifers freshen. If bred early we must feed very heavy to keep the heifer growing and increasing in flesh as she approaches calving that her milk glands and udder may develop properly, for if for want of proper nourishment we allow her to grow thin the calf will sap her strength, weaken and stunt her under these conditions it is folly to expect the heifer to develop properly and she may be ruined for life.

But if she be allowed to run until 34 or 36 months before calving she can be fully grown on rougher and less costly feed, it will take less grain to put her in good condition, and there is no risk of stunting her, but we will have lost a year's milk, and if a pure bred, probably a valuable calf, so its just questionable at what age we should have them freshen. Probably about 30 months would be the happy medium if we could order these matters as we would like, but at whatever time we decide on, we should see that the heiber is well grown for the age and in good fleshy condition. We seldom now see or hear much about keeping the dairy heifer in good condition but not fat, as almost everybody of any experience have been convinced that the more flesh a heifer carries the better she will milk, both during her first lactation period and for the rest of her existence.

To make dairying profitable we must have better cows, better "herds" of cows, and to secure a full supply everybody in the business must breed and feed for them. The amount of wealth annually lost to this Province through keeping so many poor producers is enormous. Every cow should be bred to a pure bred sire that a sufficient number of heifer calves may be available. At the present time not nearly enough good bulls are kept. The breeding season for the majority of cows is July and August, two very busy months on every farm, and its a temptation to use any little runabout if the good bull is very far away. Many farmers yearly make resolutions to breed every cow to a good bull and end up with one or two. This too important a matter to be so neglected. If good bulls were kept within reasonable distance of everybody, we would soo have many more good cows in the country, and they are badly needed. If the keeping of several pure bred bulls were a heavy tax on a community there would be some excuse for using little scrubs, but when good bulls of breeding age can usually be purchased for from $75 to $100 it is foolish to keep scrubs at only a trifling saving. In this way all it will cost is his feed and interest on investment which to my mind is an easy way to get into improved stock and every farmer can raise them without purchasing any females if he persistently breeds to the best bulls he is in reach of. If the first or second crop of calves prove disappointing as milkers. don't change the breed before you change the bulls several times. Everybody can grow 40, 50 and 60 lbs. of milk a day grades if they persistently carry out this work. Take weights and records at least three times a month. This will be found accurate if you take weights and samples carefully. It is very little trouble and pays big returns. Just consider what every farmer is losing by not having every cow the equal of the best, and what the province is losing by not having the majority up to th standard of some of the best.

Right Now

you need a

DE LAVAL

CREAM SEPARATOR

1st—If you are still using some gravity or setting process of creaming—

BECAUSE your cows have likely freshened now and your supply of milk is greater.

BECAUSE your spring work requires every minute of your time and a good cream separator will be a great time and labor saver.

BECAUSE your young calves will thrive best with warm, sweet separator skim-milk.

BECAUSE with your increased milk flow your greater waste of cream, without a good cream separator, must run into more money than you can afford to lose.

2nd—If you have a very old De Laval or an inferior separator whether new or old—

BECAUSE the losses of the poor separator from incomplete skimming, and the tainted product of the hard-to-clean and unsanitary separator mean most when your volume of milk is the greatest.

BECAUSE of the ample and "more than advertised" capacity of the De Laval, you can separate more quickly and save time when time means most to you.

BECAUSE an Improved De Laval Cream Separator is so much simpler and more easily handled and cared for than any other, and you can't afford to waste time these busy days fussing with an inferior or half worn-out machine.

BECAUSE the De Laval Separator of today is just as superior to other separators as other separators are to gravity setting.

Let the De Laval start saving cream for you right now. See the nearest De Laval agent at once, or if you do not know him, write us direct for any desired information.

Granular Veneral Disease Has Vital Relation to Contagious Abortion in Cattle

(Office of Information, United States Department of Agriculture.)

The United States Department of Agriculture, in co-operation with Cornell University will shortly publish a professional paper Bulletin No. 106, entitled The Granular Venereal Disease and Abortion in Cattle. This disease may be defined as a chronic infection of the genital tract of cattle, manifesting itself in the form of granular or nodular elevations in the genital mucous membranes, chiefly of the vulva and less frequently of the vagina.

The importance of abortion and sterility in cows is rapidly becoming more acutely felt by breeders, according to the bulletin, and is each year playing a more serious part in the national economy. By interfering more and more with the reproductive powers of cows, these diseases exert an unfavorable influence upon the production of meat, milk and dairy products, decreasing the supply and increasing the cost.

Innumerable reasons have been assigned to account for abortion and sterility in cows. Abortion has been regarded as the result of blows, goring, kicks, slips, falls, various feeds, water, drugs, etc., and finally when the abortions are numerous to contagion. Sterility has been attributed also to a great variety of causes—to the character of the feed or water, to poverty, and overfatness, and, as with abortion, when the cases are numerous, to contagion.

Veterinarians who have investigated abortion in cows in recent years have agreed that in a very large percentage of cases it is due solely to contagion.

The report then gives, in detail, the results of a large number of examinations of live cattle, supplemented by a large number of post-mortem examinations at slaughter-houses. These examinations have shown the granular veneral diseases to be present in a large number of cases of abortion.

The conclusions of the author as to the effect of this disease are as follows:

The granular veneral disease of cattle is, so far as known, universally distributed. From clinical observation, it has a vital relation to contagious abortion. It is incurable in the present state of our knowledge, but may be greatly decreased in virulence.

The ordinary if not sole avenue of the infection of contagious abortions is the genital canal, and the invasion antedates the sealing of the uterus, which ordinarily occurs within 30 days after conception.

In the present state of our knowledge, little or nothing can be done to prevent abortion once the pregnant uterus is sealed and the infection of contagious abortion exists within the hermetically sealed cavity.

By systematic disinfection of the genitalia immediately following abortion or premature birth, and also in retained afterbirth and kindred infections of the uterus, the affected animals may be largely guarded against future sterliity and abortion. It is even more important that the vaginae of heifers, whether virgin or previously bred, and cows shall be systematically disinfected for a period before and after breeding, until conception is assured.

It is equally important that the genital organs of breeding bulls be kept clean by regular disinfection, including washing immediately prior to and after service.

Most important of all, breeders of valuable cattle should institute definite, energetic and permanent efforts to guard new-born calves simultaneously against the three great dairy scourges—calf scours and pneumonia, abortion and sterility, and tuberculosis.

The following are the author's recommendations for the breeding of sound animals:

We would outline the following plan for the breeders of pedigreed and valuable dairy cattle with a view to the production of cleaner and more efficient herds.

1. The construction of arrangement of independent maternity and calf nursery stables, embodying all modern requirements for ventilation, light, heat, convenience for disinfection, and ample facilities for the exclusion of flies. The stables should provide sufficient individual stalls for all calving cows and indivdual stalls for calves until at least three months old.

2. A cow which is about to calve should be well cleaned and her posterior parts disinfected, after which she should be placed in a clean stall some days prior to expected parturition. Pending partuition, the stall

Money Used in Buying "Ideal" Fence is Not Spent--It is Invested

When you invest a dollar in "Ideal" Fence you obtain a dollar's worth—you obtain full value for your money because "Ideal" is made exactly as represented. In making "Ideal" Fence we try to make a fence that is as near perfect as possible, always keeping in view the fact that the purchaser or user wants a fence that will give service, that will last, that possesses great strength in every wire, and that does no give any bother when being erected, but goes up straight and true.

Why Heavy "Ideal" Fence is the Best Value

The Gauge or Size of Wire. In our heavy styles we use only Imperial gauge No. 9 wire which is 144|1000 of an inch in diameter.

Galvanizing is the life of the wire. All the wire in "IDEAL" Fence has a smooth, heavy but even coating of galvanizing. Rough galvanizing would peel off easily and a thin coating would soon scrape or peel off and rust would quickly eat the wire.

The Strength and Temper of the wire in "Ideal" Fence is tough and hard so as to give a snappy, elastic spring to the fence—not so hard as to be brittle like a file or knife blade, not soft and pliable like lead. We have the proper quality of wire—full gauge No. 9 with a smooth, heavy but even coating of galvanizing, and with the proper degree of hardness and toughness.

Think over this matter of fencing. The best is none too good for you,—buy the best.

Don't experiment. "Ideal" Fence will please you, giving you the most weight—strength—service.

You will find it to your advantage to examine our complete line and to consider ordering, when giving your order for farm fence, Improved "IDEAL" Farm and Stock Gates, "IDEAL" Steel Fence Posts, and other "IDEAL" Products as listed below. WRITE FOR CATALOGUE 65 NOW.

The Sussex Mfg. Co., Limited,
Sussex, N. B.

should be kept scrupulously clean and well disinfected. The tail, vulva, buttocks and udder should be disinfected twice daily. In order to avoid the danger of infection to the calf while passing through the vagina of the cow during birth, either by the infection of white scours, the granular veneral disease, or other malady, the vagina should be irrigated daily with a mild disinfectant such as 0.5 per cent Lugol's solution. Such attention to the vagina also tends to carry away any infections within the vagina, which immediately after the opening of the cervical canal of the uterus at the time of calving may otherwise drop into the uterine cavity and there establish disease.

3. When the calf is born, it should be received upon a clean antiseptic sheet and at once carried to a clean calf stall and rubbed dry. If it is temporarily with the cow, great care should be taken to see that the bedding is kept clean.

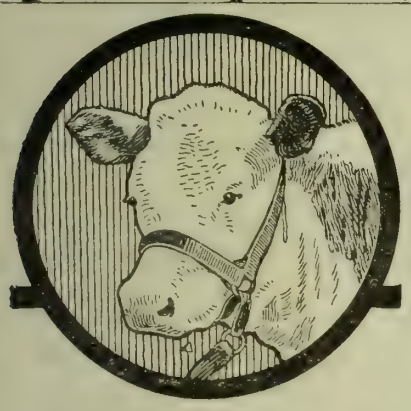
After the calf has been dried, if not earlier, the stump of the navel cord should be disinfected. It should not be ligated. Prepare a warm 1 to 1,000 solution of corrosive sublimate, fill a goblet or cup with it, and, having the calf held in a standing position, press the vessel against the floor of the belly, so that the stump of the navel cord is submerged in the disinfectant. Hold it in this position for at least 10 minutes. Immediately afterwards, dust the stump of the cord over liberally with a disinfecting desiccating powder, as alum and camphor, and repeat every 30 minutes until the stump is dry.

The body openings (mouth, nostrils, vulva of heifer and sheath of bull calf) should be disinfected with a 0.5 per cent Lugol's solution.

4. Prior to drawing milk from the dam or other cow for feeding the calf, or permitting the calf to suck, the udder and adjacent parts of the cow should be thoroughly disinfected. The milk should be drawn in a sterile vessel under the strictest cleanliness. If the milk is from a cow not known to be free from tuberculosis, it should be sterilized before feeding. Individual feeding vessels should be used and regularly sterilized.

When calves have reached three months of age, it may usually be fairly determined if they are free from disease, in which case they may be handled in groups. These, however should be kept as small as economically practicable until the heifers have calved and are ready for the dairy. Even the the larger the number of animals in one stable the greater the risk of infection and the more destructive will it be if it gains entrance.

5. When breeding time for the heifer grown under the foregoing conditions is approaching, we would advise that her vagina be douched once daily at least three weeks before breeding, at first with 0.5 per cent Lugol's solution. The douching should extend over at least one estrual period, or 21 days prior to breeding, or until it is determined she is pregnant. The bull should preferably have been grown in the same manner as the heifers he is to serve, and his genitals douched in a similar way.



Raised on "Purina" CALF MEAL!

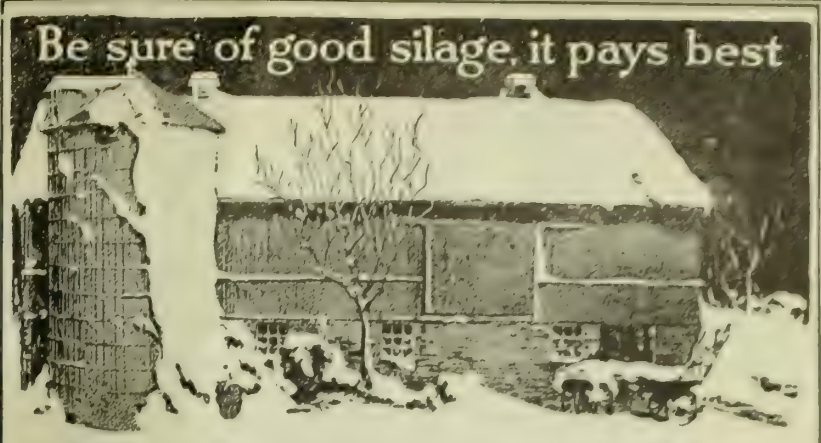
The **CHISHOLM MILLING CO.,** Limited
Dept. D TORONTO

Protrusion of the Rectum in Pigs

Generally this trouble has something to do with the feeding, but the actual cause is either constipation, as in weakly, pot-bellied young sows, long-continued diarrhoea, both states of the bowels giving rise to straining, which not only causes the protrusion, but operates adversely when attempts are made to return and retain the gut. In the treatment of the trouble there is nothing whatever to be gained by adopting a waiting policy. The protrusion rarely, if ever, recedes, and when finally the veterinary surgeon is sent for he finds himself greatly handicapped by the swollen condition of the part, and its dryness consequent on constriction and long exposuse to dirt and atmospheric air. Young pigs, which are very liable to it in cold weather, are easily treated if the bowel is promptly returned and careful attention is paid to the diet Before replacement is attempted the rectum should be emptied, and thoroughly cleansed by washing in tepid water or milk. A most useful lubricant, being at the same time mildly astringent and soothing, is the compound gall ointment of the British Pharmacopoeia. It is a mixture of powdered nut-galls and opium in lard. it relieves pain and prevents the straining, which operates so adversely in the returning and retention of the organ.

(Continued on Page 474.)



WHEN winter comes and you open up your silo, you will get the real proof of silo values. If you have an Ideal Green Feed Silo, your silage will be good. You can rest assured of that. But if you have one of the so-called "cheap" silos you will get proof of the fact that good silage cannot be produced in a poor silo. Good silage is what you want. Poor silage is worse than none at all.

Remember that after you have your silo erected and your corn stored in it, there is no getting your money back for either the silo or the corn crop that has been wasted. The assurance of good silage that the

IDEAL GREEN FEED SILO

gives you is well worth the cost. When you consider how many more years the Ideal will last, and give you good silage every year, there is no question of its being worth far more than any other.

The few dollars a man may hope to save by buying a "cheap" silo will very likely be the cause of his losing, through poor silage and the short life of the silo, many times the amount he seemed to be saving on the first cost. Your good judgment should warn you against taking chances of losing your feed by putting it in an inferior silo.

The reasons why Ideal Green Feed Silos preserve the silage better and last longer are completely explained and illustrated in our large silo catalogue, a copy of which will be gladly sent you upon request. It will pay you to ask for this catalogue before you finally decide on what silo to build.

Breeding Out Defects.

By A. S. Alexander, V.S.

It is an axiom of breeding, or heredity, that "like produces like," or tends to do so, and that is true; but it is not the case that nature tends to strike an average or effect a "happy compromise" between two markedly unlike items of conformtion or temperament. This is not commonly understood by the stock-breeder who has not made a special study of this perplexing subject.

Poor feet and bardly-formed hock joints are two most common faults of the horses we breed upon the farm. How shall we get rid of these objectionable features of our horses? Not by breeding to sires that have directly opposite features. That is the common plan of procedure, and it is erroneous. The common sense, logical and correct procedure is to employ sires as nearly perfect as possible in the points deficient in their mates. It is an even better plan to discard at once the mares that have the objectionable features and breed from those having the desired conformation, mating them with sires of like desirable conformation.

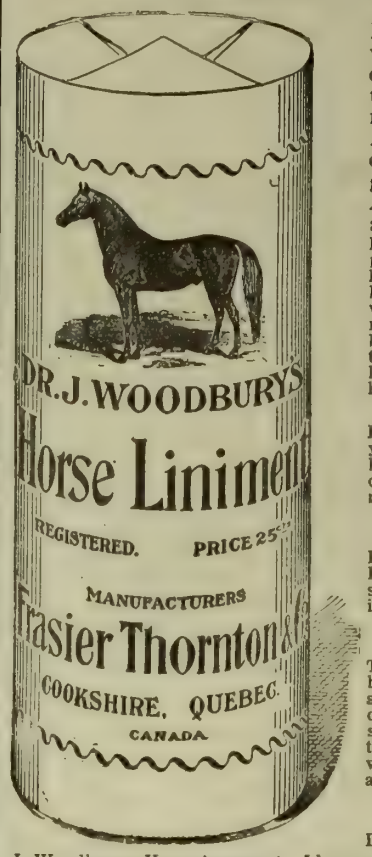
To make this move plain it may be stated that when a man finds that the horses he breeds have small, poor quality feet (hoofs) his plan of corrective action too often is to mate his mares with a stallion that has abnormally developed feet. Such feet are as objectionable as feet that are too small. Two objectionable types of feet, wholly dissimilar in type, will not in the foal be reproduced as an average between the two types. In other words, the too big and the too little hoofs will not blend and make correct size hoofs in the offspring. Two wrongs do not blend to make a right, but one right and one wrong may partially offset each other. If one right is stronger (by breeding) than the wrong the resultant blend of the two may, but does not surely favor the right. The correct way to attempt righting of the wrong, i.e., improving the small weak feet, is to use a stallion that has the most perfect feet possible and that owns such feet because of ancestors that had like desirable feet. The best plan from the start is to select mares having the right sort of feet and mate thhm with stallions having the same sort of feet, or even better feet, if that is possible. In breeding horses we have found that it is a slow uphill disappointing matter to breed out faults by the use of sires not possessed of these faults. This applies to the breeding of better feet, but more especially to the improvement of badly formed hock joints.

A fine, large, pure-bred Percheron mare that was well-nigh ideal with the exception of having hocks that approached the sickle type, or curby formation, was mated each spring with a pure bred Percheron stallion. Each of these stallions had hocks of correct conformation and in one instance hocks of the somewhat too straight type. Each foal from this mare so mated grew up with hocks like those of the dam. Some of the offspring had hocks of more accentuated curby formation than those of the dam. All of them had objectionable hocks in this particular. We knew the sire of the mare in question. He was a noted Percheron stallion 20 years ago, but his hocks were objectionable, being weak in conformation, somewhat of the sickle order, and one of them showing a small bone spavin. The mare inherited poor hocks from the sire. No doubt he in turn came by such hocks through heredity, and the wrong shaped hock in this family is so strongly bred in the "breed and bone" that life is too short, apparently, successfully to obliterate it by selective mating. We got rid of the mare and most of her female progeny, and other mares of better type have been installed in their place.

Based upon actual, extended practice and observation we have no hesitation whatever in advising readers never to buy or employ a mare for breeding purposes that has a bad fault or conformation, with the hope that in time the offspring may be made free from that fault by use of sires of opposite type, not having the same fault and even extraordinary excellent in the opposite direction. This advice applies with equal force to the breeding of animals other than the horse. Faults of conformation cannot readily be bred out. In all instances for quick results and satisfaction in breeding, decide upon an ideal animal to be produced, start with a

Dr. J. Woodbury's Horse Liniment

THE INFAILLIBLE REMEDY



For the removal of Splints, Bog Spavins, enlargements of any and every description it has no equal. Given internally, it will promptly relieve and remove any and every character of Cough Enlargements of the Glands, Affections of the Kidneys. For distemper, strangles, and colic it is infallibly the remedy All horses that are stabled should have an application of Dr. J. Woodbury's Horse Liniment to the hoofs of the forefeet to prevent their becoming feverish, dry, brittle, hard, contracted or otherwise injured Insist on having Dr. J. Woodbury's Horse Liniment. We warrant it to effect that for which it is recommended when used according to directions. Its beneficial effects are so prompt and decided that it has excited the admiration of the leading horsemen of the Dominion and secured their highest confidence.

Bear River, N. S.

Dear Sirs:—We do not hesitate in recommending your Dr. Woodbury's Horse Liniment. We have used it in the woods for coughs, colds, distemper and cuts and would say that no lumberman should be without it.

Yours truly, Clarke Bros.

Hubbard's Cove, N. S.

Dear Sirs:—I have used Dr J. Woodbury's Horse Liniment in my stable for years and consider it the best liniment on the market for both internal and external use.

Yours truly, C. C. McLean.

Truro, N. S.

This is to certify that I have used Dr. J. Woodbury's Horse Liniment with the very best results for colds, coughs, distemper and all lung deseases. It is the best to give horses in the spring to keep them in condition. It purifies the blood, cleanses the lungs from impurities which may exist and gives the system healthy action.

Newton Lee, Owner "All Right" 5817.

Elmsdale, N. S.

Dear Sirs:—Kindly send me 6 dozen bottles Dr. J. Woodbury s Horse Liniment. I have not a bottle in the store and it is the only kind my customers will take. Yours truly, Elmsdale Mercantile Co.

Elmsdale, N. S. Dear Sirs:—I cured my horse with Dr. J. Woodbury's Horse Liniment. It was a bad case of distemper. I always recommend this liniment to my friends as the best for all diseases of the horse. Yours truly, H. R. Whitehead.

Dear Sirs:—One of my horses had a bad cough and I made a complete cure with three bottles of Dr. J. Woodbury's Horse Liniment. The cough was of twelve months standing. In my large experience with horses I consider this liniment to be the best made for all diseases in the horse, I recommend it to my friends. E. J. Anderson, Truro, N. S.

FRASIER THORNTON, &, CO., Limited, Manufacturers: Cookshire, Quebec, Canada.

Eczema Was Cured Twelve Years Ago

Dr. Chase's Ointment Proved to be a Permanent Cure.

The old idea of eczema being a disease of the blood has been pretty well exploded by the record of cures made by Dr. Chase's Ointment.

Some doctors still advise internal treatment, but the results are slow and uncertain, and too often a lamentable failure. With Dr. Chase's Ointment it is different. You apply the ointment to the sore parts. It cleanses the sores and soon sets up the healing process. In a few days you can see with your own eyes the wonderful change that is taking place and are encouraged to keep up the treatment until the cure is complete and the sores replaced by smooth, natural skin.

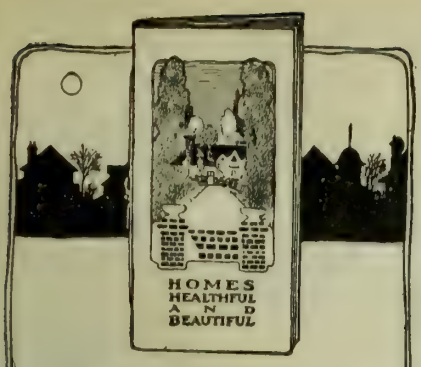
It is wise to look after your general health, keep the bowels regular and the blood rich, but you can depend on Dr. Chase's Ointment to cure the eczema if you will do your part and apply it regularly.

Mr. W. H. Roberts, Charlottetown, P.E.I., writes: "I can recommend Dr. Chase's Ointment to anyone suffering from itching skin disease. I had eczema on my leg and suffered terribly from the itching. I had a doctor treat me for four months without relief, and I was getting worse all the time. A second doctor gave some relief for a time, but made no cure. I tried several advertised treatments, but without relief until I used Dr. Chase's Ointment. This ointment cured me in a month. That was twelve years ago, and I have never had a sign of the old trouble since.

"Since then we have always kept Dr. Chase's Ointment in the house, and find it invaluable for chafing, chilblains, insect stings and burns. I would not be without it if it cost $5 a box."

"This is to certify that I am personally acquainted with Mr. W. H. Roberts, and believe his statement regarding the use of Dr. Chase's Ointment to be true and correct."—(Signed) Alex. Horne, Justice of the Peace.

Dr. Chase's Ointment, 60 cents a box, all dealers, or Edmanson, Bates & Co., Limited, Toronto.



A handy book on home decoration

(With furnished rooms in colors)

Think of the time saved in worry and experimenting. Think of the possibility of avoiding **serious mistakes.** Some of the sub-headings show just how practical this book is: "The Influence of Color"; "Light and Shade"; "Harmony in Colors—How to get the Right Effect"; "Value of Conventional Designs"; "Plain Tinting"; "Color Values."

female or two as nearly of that type as possible and continuously mate with sires of that chosen type. Discard every female that does not approximate the chosen type and, so far as possible, only retain as breeders the ones that are above average in the desired type. Do this also in the selection of sires and there will be good reason to expect that the progeny of such animals will retain the desired type and possibly improve in that respect, if improvement is possible.

Remember that quick results for the better cannot come solely from one side of the breeding equation. The nearer the two factors in the equation are alike at the start the more certainty will there be in obtaining the sort of stock desired. Gradually by continued grading up, by the use of pure bred sires, the type and character of the pure parents become dominant; but all the while this warring element from the dam's side and ancestry seeks ascendency and lessens peramnency of improvement. For quick results never start with widely diverging types, or violent opposites of blood.

In conclusion, to clench the idea here adviced, let it be said that we have known many men to fail in horse breeding because they bought a lot of cheap, foot-sore mares in the city and used them as breeding battery on the farm, hoping and trying, for a number of years, to attain improvement and success simply by the use of good sires and good feed. better and quicker results would have been had by starting with one ideal well developed brood mare of the type desired and mating her and her female progeny in turn, year after year, with the same sort of purebred, rightly formed sires used with disappointing results upon the city mares of the wrong type.

Stable Notes.

White Legs and Disease.

Some time ago, relative to a case of "mud rash," a man said to me that he "never had any but a white foot affected." This is not the general experience, for I have seen horses of all colors denuded of hair over the skin of the belly, inside the thighs and the legs, and white skin has no monopoly of either the acute or chronic forms of erythema we call mud-fever and cracked heels; but the necessity for washing the legs, or the manner in which, owing to the limited time at the disposal of the carter, the washing is carried out, does undoubtedly induce disease. There is, however, an impression prevailing, not only among the owners of animals, but among many veterinary surgeons, that white skin is peculiarly subject to disease. There is the eczematous inflammation known as "crown scab." This is chiefly seen affecting animals with white faces and legs, and some have gone so far as to affirm that it it not known to attack any but the white portions of the skin, and that animals without any white hair are exempt from it. Sheep with white legs and faces are considered to share with horses the liability to this disease. Personally, I have never observed any special liability of white skin to disease simply because it is white, but have no doubt that repeated washing and imperfect drying tends to cause it to become diseased. We certainly see more white heels that that are cracked or affected with chronic erythema, and more white legs that are greasy, than we do dark ones; and whether this is due to constitutional tendency, or to badly-directed efforts to keep them clean, it is certainly a sufficient reason for discouraging rather than for encouraging the breeding of horses with white legs. Look at the state into which white legs, and especially the hind ones, get merely from standing in the stable. They stand in the most moist and dirtiest parts of the stall, and one soiled foot is rubbed against the opposite limb. The white becomes a dirty brown or yellow, and soft soap with hot water is employed to restore it to something like its pristine "flash" condition. Soft soap produces a very irritating effect on the skin, ownig to the strong alkali it contains. It is frequently not all lathered up or properly rinsed out, and even if the washing and rinsing are perfect, the drying is necessarily perfunctorily performed, because no one man with several horses to look after has time to dry thoroughly the long hair about the heels. Everyone of any experience of the management of horses under working conditions agrees that the principal causes of mud fever. cracked heels and grease are washing and insufficient drying the legs, especially where

Winter Laying Poultry

We introduce the "Barron" strain of White Leghorns to this part of Canada.

The following are extract copies of Mr. Barron's invoices :—

4th January, 1914.
To 12 White Leghorn Pullets bred from a 260 egg hen, and one Cockerel, brother to my little hen that broke the records of Europe, Canada and America with 282 eggs.

21st March, 1914.
To 12 White Leghorn Pullets and three Cockerels from 260 egg pedigree birds.

This is the strain we offer you, backed up by our assurance that during the severest weather of the past winter our birds were making records considerably over the 200 egg mark.

Eggs for hatching, guaranteed off the above stock, $3 per setting of 13. Unfertile replaced at half cost.

Ten strong, vigorous day-old Chicks, guaranteed off the above stock, $3. Twenty Chicks, $5.

Orders for Eggs shipped now. Orders for Chicks shipped in May or earlier if wanted.

Winter Laying Poultry Pay. Our Birds are Guaranteed Winter Layers

POULTRY

Why Don't Hens Lay ?

If there is any one question which is asked more than any other, it is, "Why don't hens lay?" and it is my intention to tell you some of the reasons why they don't.

In th first place, let us consider the breeding of the birds. There are many varieties and breeds, all of which have good producing strains and poor producing strains. Now, if these birds have come from a strain which has been bred more for fancy purposes, for feathers, than for utility purposes, or the production of eggs, it stands to reason that all the attention was given to the fancy, and none, or practically none, to the other. And everyone knows that to get a good producing strain, we must give considerable time and thought to the selection of breeders.

Now let us consider the time of hatching. If the birds were hatched out late, say from the last of June on, unless they had the very best of care, they would not begin to lay before cold weather set in. You might have a flock of pullets which had developed well and which looked fine, but they probably would not begin to lay in cold weather. Pullets should begin to lay by the early part of November, anyway, in order to be well under way before real cold weather begins.

Feeding is the next important factor to be considered. Regardless of the breeding of the parent stock, if the stock hasn't been well fed and cared for, it cannot lay. If the chicks have not been supplied with sufficient green food, a variety of foods, bone-forming material, good clean water in clean containers, clean hard grain, and plenty of shade, then they will have been neglected and egg production.

Housing is another factor which causes trouble. If the poultry house is cold, or damp, or nasty, or dark, or drafty, the hens cannot lay as they should. If the hens are crowded, they cannot have sufficient room for exercise. The stronger birds will crowd the weaker ones from the food, eggs are liable to be broken if the nests are crowded, and the habit of egg-eating contracted, which, when once established, is hard to break. They cannot get sufficient fresh air, the air becomes foul, the spread of disease is more rapid, and the general health of the fowl is affected. It is felt first in the egg production.

Since the foregoing are some of the reasons why hens do not lay, perhaps it would be well to point out some of the reasons why hens do lay.

First, let us consider the breeding. If a person has, by constant selection of his stock, obtained a strain of fowls which are good producers, one ought to get a cockerel from that person to use with his own stock. From his own stock, select those pullets and band those which begin to lay in October, or early in November, and then breed from them. If you wish to breed from yearling hens, breed only from those which molt late, even though they lay but few eggs the winter that you select them. Select a cockerel which is a good, vigorous, healthy bird, one that has never been sick, one which crows loud and often, and a fighter.

Feeding is next. From the very first the chick wants to be kept growing. There must not be any period in the life when it was stunted. The first feed should be given at 36 to 48 hours old, and should be sour milk. Feed the chick a variety of good sound grains, give it plenty of range, with some shade, plenty of fresh water, and dry, clean quarters, and it will grow well. Give it grit, shell, gorund bone and some meat scraps.

The brooding of the chick, especially when small, is a problem. For us in this climate, the open-front house of the Aubry type is very good. The coal-burning brooder is probably the best method yet devised for the brooding of the chick. It gives the heat to the chicks on their backs, there is no tendency to crowd toward the centre, there is a constant supply of fresh air under the hover, which is so essential, and there are different graduations of heat to which the chick can adapt himself. The house should

be kept scrupulously clean and free from lice, as cleanliness is essential to the production of eggs.

The poultry should be housed early in the fall, in September, so as to get them used to their winter quarters, and also to teach them to scratch for their food, which exercise is a benefit in helping to develop the egg-laying organs. The birds should be housed in quarters facing the south, if possible, having no drafts, and so ventilated that there shall not be frost in the interior. they should have at least four square feet floor space, and six to eiches inches roosting space per bird.

In conclusion, would say that if the poultryman is familiar with the conditions which affect the egg pro duction, he will be able to answer for himself the question, "Why don't my hens lay?"

A. W. Richardson,
Instructor in Animal Industry, Poultry Division, Maine.

Housing Geese

Because geese are very hardy birds that is not sufficient excuse to neglect them so far as their housing arrangements are concerned. To achieve good results a comfortable shed should be provided for their accommodation. The house should be about 4 ft. high, and made of fairly thick boarding. If the timber is very thin the interior becomes too cold during the winter and too hot during the summer. The earth makes the best floor, as wood, cement, and bricks are all unsuitable and liable to lead to leg weakness. I have always found it a good plan to use a shed entirely, or almost, open in the front. If the house can be placed in a sheltered position no shutter is necessary, but if out in the open, exposed to the wind and rain, it is advisable to have one which can be opened or closed at will. The best plan is to have it hinged at the top so that during a driving rain it can remain partly open, yet at the same time afford protection. An abundant supply of fresh air is necessary, without which ill-health will make itself apparent among the birds. No overcrowding should be allowed, and as far as possible about 6 square feet of floor space should be given to each bird; that is, a house 6 ft. by 8 ft, accommodates eight adults.—Expert.

Cooling Eggs While Hatching

A very common mistake in artificial incubation is made with regard to the daily cooling of the eggs. It is seldom that operators allow sufficient time for this, which can only be accounted for by the fact that it is usually believed to be harmful. It must be remembered that an egg takes a long time to lose its heat, and therefore if only allowed to cool for a few minutes it has very little effect. Again, the length of time given must depend on the temperature of the room, for the eggs lose their heat more rapidly in a cold room than in a warm one. Taking the average temperature of 60 degs., the eggs should be cooled for twenty minutes in the morning and fifteen in the evening. The difference in length is suggested, for usually a longer time elapses between the night and morning cooling than between the morning and evening. If the temperature in the room is oly 50 degs., then fifteen minutes in the morning and twelve minutes in the evening is sufficient; if the room is only 40 degs., then twelve minutes and ten minutes is ample. If on the contrary, the room is 70 degs., twenty-five minutes should be allowed in the morning and twenty minutes at night, while if it be 80 degs., then thirty-five minutes and thirty minutes respectively should be allowed.—Expert.

Samantha Interviews Roosvelt

By Josiah Allen's Wife, in New England Farm and Home.

Josiah an' I have been to Mandy Jinerses on a tower. Bizness called Josiah to a neighborin' town, an' I beset him to go on a few milds further an' give me a chance to see Mandy. We went to school together an' we sot considerable store by each other.

Well, most the first thing that Mandy said to me after we passed the compliments an' interviewed each other about our two healths an' the queer weather we wuz havin', an' our different pardnerses whose acts we considered most as queer as the weather—she gin me the startlin' information that Theodore Roosevelt wuz goin' to speak there that night in the town hall.

An' I sez: "Why, Mandy Jiner, I take that as a plain dispensation! For months I've been wantin' to see that man, an' neighbor with him an' advise him for his good."

"Well," sez she, "I guss you won't have much chance to neighbor with him tonight; you won't see him only when he's on the rostrum."

"But," I sez, "if Fate has made up her mind that we shall meet, no ros trums is goin' to stand between us. I consider him one of the greatest men of our time, but like every other male man, he's liable to make mistakes." An' I sez furder: "For months an' months I've jest ached to labor with that man as a promiscuos adviser, an' I feel now the way is bein' made as plain to me as if a red carpet wuz bein' let down from the sky a-leadin' me to him."

"I don't see how you can talk with him," sez she; "there'll be more'n fifty people round him after the lecture, wantin' to shake hands an' talk with him. I d'no how you'll manage it."

"Neither do I," sez I, "there seems to be big lions in the way. But the lions will sneak off an' give me a chance at him, and you'll see they will. Old Fate hain't a-goin' to take me by the hand an' lead me toward him clear from Jonesville, an' then leggo—she will open up the way."

I sez this quite boldly an' firmly, but how it wuz goin' to take place I didn't know no more than a infant babe, but I laid holt of the horns on the altar of Faith with both hands, an' wuz determined to hang on, an' I felt that I should be led.

An' sure enough, it wazn't twenty minutes after that remark to Mandy Jiner, that a female friend of hern, a Mis' Gansey, whose husband kep' the only tavern in the place, come to call on her. An' when she hern of my strong desire to interview an' advise Theodore Roosevelt, she invited me to come over to her house to supper.

I guess she invited me out of curiosity some, as if I wuz a four-legged hen or a two-legged cow, from a remark she made to me later. I don't believe she invited me out of affection or any reverential feeling, or such as you would naturally thought she would have, a-witnessing such a great historical event as Samantha Allen advisin' Theodore Roosevelt for his good. She sez: "You'll have plenty of time to see him after he's eat supper."

An' I sez: "I'd ruther see him at that time than at any other, for vittles almays ameliorates a man's disposition an' makes him better natured. He's got a tegus job before him," sez I, "for I've got to make him see he's puttin' the wrong foot forward, an' I'm glad to have him take plenty of refreshment before I begin."

"He's a hard man to turn round," sez she; " he's so sot."

"I know it," sez I, "I'd ruther tackle twenty mules an' several drumedaries than this job Duty has sot up in front of me, an' I don't know how I'm goin' to come out with it, but I feel that I shall be led."

"Well, my trust wuz rewraced, the horns on the altar of Faith didn't give way under my holt an' I didn't leggo on 'em. But it all come round right, an' I got my opportunity as easy as fallin' off a log onto a bed of moss. Josiah had gone down town to get some necessaries Mandy wanted, an' I went home with Mis' Gansey, for it wuz drawin' nigh supper time an' I felt that I must be promp.

Well, the train come in as promp as I wuz. Theodore Roosevelt come in on the train an' most immegiately afterwards supper wux announced, for it bein' a small town folks still kep' the good old-fashioned way of eatin' dinner in the middle of the day, an' callin' the last meal of the day what it ort to be called an' what we have Bible proof for callin', supper. Hain't I got a picture hangin' up in my dinin' roomed named The Last Supper? I guess you never hearn any the old 'Postles callin' it the last dinner. No indeed! But I am maenderin' from the subject, an' to resoom backwards:

There wuz only a few folks in the dinin' room, an' Mr. Roosevelt set at the very next table to mine. Havin' made an exhaustive an' scientific study of man nater for so many years, I didn't say a word to him until after he had finished his supper, an' I wuz glad to see that his appetit wuz indeed good and the hulsome vittles disappeared rapidly. An' after he'd finished eatin' and sot back in his chair I advanced onto him an' held out my hand in a very friendly an' respectful way, an' sez:

"Theodore" (I had made up my mind to call him Theodore, jest as his ma probably used to call him when she wanted to deal with him); sez I, "Theodore, I call this one of the most wonderful and agreeable events of my hull life, to have the privilege of lookin' in your face an' takin' your hand an' neighborin' with you for a spell." By this time he had riz up an' had shooken my hand, an' I had introduced myself to him.

He smiled that genial, open hearted smile of hisen, so often reproduced in the papers. Why, if I had met that smile goin' round alone in the desert of Sarah without a chaperone, I should have reco'nized it an' liked it.

By this time the folks had all left the dinin' room, an' I sot down an' he bein' a perfect gentleman, did the same. He sot down an' folded his arms an' leaned back in his chair with a expression on his good-lookin' linement as if he wuz goin' to be resigned to anything that might happen to him.

Sez I the first thing after we wuz sot: "Theodore, I have always sot store by you, I've always considered you one of the greatest men of our nation and the world."

I paused here a minute to let that sentence strike him an' soak in an' let him look gratified at the compliment, which he did. He made a bow in acknowledgment on't an' smiled that agreeable well-known smile of hisen agin.

Sez I: "I've always kep' the eye of my spectacles on you from the time when a delicate, sickly lad you attackted ill-health with determination an' a cow pony, chasin' it over canyon an' prairie, an' conqqueqred it; I watched you tryin' to purify New York politics, a job that couldn't be did, but you done your best; I see you leavin' luxury an' ease at the call of your country an' Duty, I watched you stormin' up San Juan Hill chasin' the enemy an' comin' out ahead; I see you attackin' the rocky and nasty cliffs of politics an' political envy an' see you fool theme enemies and come out on the hights at Washington, D C. An' whilst there I watched you sendin' out the Doves of Peace to hover over foreign nations, leadin' 'em into their own realm of Peace; I see you attack entrenched evils; I see you workin' to make our great nation still greater by jinin' the waters of the Pacific an' the Atlantic.

"An' afterwards I see you victor over wild beasts, stormin' impenetrable forests an' discoverin' onknown waters, an' all the time through them strange events a-takin' such good an' faithful care of your wife an' fambly that the vultures of domestic scandal that are always layin' in wait to swoop down onto great people couldn't never come nigh you. I've watched your onward path, step by step, exultin' in every victory of yourn, jest as proud on you as if I wuz your own mother-in-law. You've gone on bravely an' undaintin'ly, puttin' the right foot forrerd from day to day, till, I am sorry to say it, Theodore, but I must—"

An' here I put on a lower, sadder axent an' a dejecteder an' meachiner look onto my linement, as I sez: "I have seen you a puttin' the wrong foot forred an' I feel as a promiscuous adviser and lifelong admirer of yourn, I had to help you draw that wrong foot back an' strike out boldly agin with the right one "

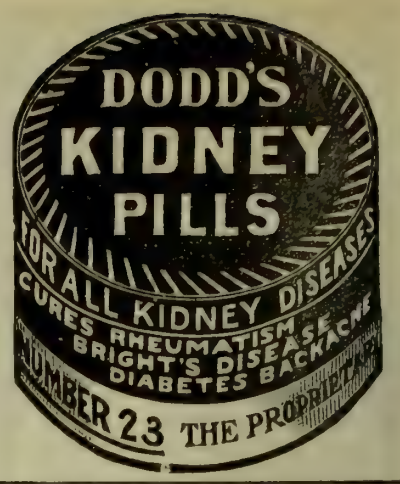
He looked down onto his boots with a pensive air an' looked deeply surprised, the broad, open-hearted smile faded some on his linement an' I knowed he felt hurt, but I had to go on:

Sez I: "A man with your intelleck an' world-wide influence, Theodore, must know that when you advocate wor you are helpin' to bring it on. The horror, the heart aches, the poverty, the unparalleled crime of men butchering their brother men, beating out the spark of God-given life that they can't give back—"

I see by his expressive face what he wuz thinkin' on, that the dignity of our Nation must be opheld at all hazards, an' I answered that thought of hisen.

I sez: "Theodore, you're not a woman. Mebby you hain't gin enough thought to it, but you belong to only one-half of the Nation, an' I feel that I have the right to represent the other half, though that right is disputed an' denied to us. An' speakin' for our half, I tell you that when wives an' mothers are bendin' over the mangled forms of them they love best, huddlin' starvin' children to their gant breasts, the rwod 'dignity' has little meanin' to them. An' afterwards, to a Nation ruined, impoverished, sot back in every way for centuries, the word 'dignity' won't look nigh so big nor so good as some other words in the dictionary—'Peace,' for instance, an' 'Plenty' an' 'Prosperity.'"

He sot kinder oneasy in his chair an' wiggled some, but I went on, for I had to: "I know you an' lots of other good an' great men feel that the men of America must not be cowards. But speakin' as I do from my half of the Nation to your half, I would ask you to answer honestly what is brave? Is it to ride away to kill men to the music of bugle an' drum, leaving wife an' mother an' children, helpless ones, to fight alone the gant wolves of Want and Agony? Or is it brave to refuse to desert the ones they swore to protect, because some big dignitary got angry with some other one, an' both call on the common people to settle that quar-



HUSBAND OBJECTS TO OPERATION

Wife Cured by Lydia E. Pinkham's Vegetable Compound

Des Moines, Iowa.—"Four years ago I was very sick and my life was nearly spent. The doctors stated that I would never get well without an operation and that without it I would not live one year. My husband objected to any operation and got me some of Lydia E. Pinkham's Vegetable Compound. I took it and commenced to get better and am now well, am stout and able to do my own housework. I can recommend the Vegetable Compound to any woman who is sick and run down as a wonderful strength and health restorer. My husband says I would have been in my grave ere this if it had not been for your Vegetable Compound."—Mrs. BLANCHE JEFFERSON, 703 Lyon St., Des Moines, Iowa.

Before submitting to a surgical operation it is wise to try to build up the female system and cure its derangements with Lydia E. Pinkham's Vegetable Compound; it has saved many women from surgical operations.

Write to the Lydia E. Pinkham Medicine Co., Lynn, Mass., for advice—it will be confidential.

A WOMAN'S MESSAGE TO WOMEN.

If you are troubled with weak, tired feelings, headache, backache, bearing down sensations bladder weakness, constipation, catarrhal conditions, pain in the sides regularly or irregularly, bloating or unnatural enlargements, sense of falling or misplacement of internal organs, nervousness, desire to cry, palpation, hot flashes, dark rings under the eyes, or a loss of interest in life, I invite you to write and ask for my simple method of home treatment, with ten days' trial entirefree and postpaid, also references Canadian ladies who gladly tell how Plymave regained health, strength, Fair, Giness by this method. Write Carey, Address: Mrs. M. Summers, Windsor, Ont.

The Old-time Painter Says:

"It beats me how folks will skim a few cents off the price of paint, then turn round and waste dollars on labor.

On most jobs labor costs about five times more than paint and it takes just as long to put on low-grade paint as it does the good kind.

The good kind will wear five years to two or three years of the low-grade.

It's just a case of simple arithmetic and money saved, by cutting out labor and using

MAPLE LEAF PAINT

Made in Canada

It Makes Good Because It's Made Good.

No Sir—I'm not killing my job—I'm building a better reputation when I use Maple Leaf or recommend you to buy it from the hardware dealer that's got the M. L. Sign on his store.

You'll want to know something about this quality, money-saving Paint,—so I'd advise you to write and get sample colors and suggestions from the

rel with their heart's blood, whilst they set back nursin' their 'dignity an' lookin' on?

"I know what you an' some other great men say, that being prepared for war will prevent our going into war. That's a great quqestion, Theodore. Some quqestions are so big an' have got so many sides to 'em, on 'em from every side with your very strongest spectacles, an' then you can't hardly decided about 'em. No doubt on the side you look at it, complete an' elaborate prepartions for war will help to avert war. But has it in the past? Has it stopped in Europe? Germany's worst enemy won't say she was not prepared for war. But did that prevent her from rushing into war? Or did it spur her onwards to show off her elaborate arms an' armaments? She naturally wanted to use what she had for so long a time prepared to use. You'll find that trait in every human bein'. An I tell you, Theodore, when folks fight ag'inst a trait deep intrenched in human nater, they are not to get left, an' you'll find that in human bein's from the cradle to the grave, an' I'll prove it to you.

He gin a deep sithe an' folded his arms more closely acrost his chist, an' leaned back furder in his chair with a resigned look onto his linement, an' I went on:

To begin with youth, when Johnny Smith got some brass things to wear over his knuckles to help him to hit harder in fightin', didn't he fairly ache to have a scrap with some other kid an' show 'em of' before fem? He didn't wait for any good excuse to fight, but jest pitched into Solomon Gowdey's little Nathan, an' wuz so proud of showin' off his superior preparations for war that he drawed blood an' had to be fairly pried offen him.

"An' Miss Ebenezer Meechum, when she got her new paror an' guest rooms built on, why, didn't she gave a party before the paint had mairly got dry? She didn't wait for company to send word they wuz comin'. She invited 'em, wantin' to show off her nice things. She had prepared for company an' wanted it. Billy Keyser wuzn't no more anxious to show off his elaborite an' splendid preparations for war than she wuz to show off her preparations for company."

At this juncter I see by his expressive linement that he didn't agree with me, an' knowin' that my kinder hung together, I brung up a man illustration.

Sez I: "Josiah got a new suit of clothes as I thought, so to be prepared in case of some extra occasion. But didn't he put them on the very next time he went to Jonesville? And I sez to him; 'What makes you wear them new clothes, Josiah? Why don't you wear your pepper an' salt suit?'

"'What did I get them clothes for?' sez he, 'I didn't git 'em to shet up an' look at, or to feel of 'em; I got 'em to use.'

"'I thought you got 'em to wear if anything happened.'"

"'Well, sunthin' has happened," sez he, "I'm goin' to Jonesville with the mare, an' I presume Deacon Gowdey will be there; he's always dressed better than I have; an' sort o' looked down on me, an' I'll shom him that I can dress better than he can.'

"There it was, Theodore—that trait shinin' out plain agin An' considerin' that you find that trait in every human bein', male an' female, child an' adult; an' seein' our Nation is made up of people an' wimmen, with that same trait in all on 'em, I've been afraid that Uncle Sam would act like Josiah, an' if he got more extravagantly an' elaborately prepared for war than other Nations, he might git bigheaded an' want to show off, and might step out with a chip on his shoulder an' act."

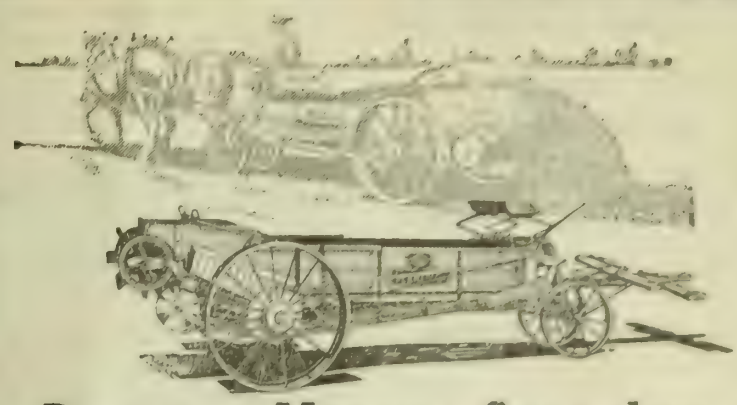
At that very minute a big-boneded man come a bustlin' in an' advanced onto Theodore, follered by seven or eight other men, the committee, so Miss Gansey said. They jest surrounded him, makin' profuse apoligies for not havin' met him, through some mistake, etc. They jest hid him from me an' hustled him off into another room, makin' excuses all the time as they feut. I d'nc as Theodore see the deep, respectful curchy I made him as I left the Presence.

But I sez to Miss Gansey, after he went out: ' What a man that is! How riz up his talk to me wuz! Sez I: "If I ever hearn true eloqquence. I hearn it to day from him. I didn't agree with him, but I wuz jest carried away with his beautiful talk."

"Why," sez she, "he never said one word! I wuz peakin' in all the time an' he never spoke one blessed word."

"I wuz dumbfoundered and couldn't believe her. "Impossible!" sez I. "Why, didn't he bring up all them arguments of hisen, an' didn't I argy an' convert him, I hope?"

Josiah had come in onbeknown to me, an' he jined right in with Miss Gansey. Sez he: "I sot back there by the door all the time, an' I can take my oath that he never said one livin' word, not one! An' good reason, too, you didn't give him a chance. He opened his mouth once or twice to speak, but you went right on an' drownded him out, jest as females always will, if you give 'em a chance." An' he went on: "I'll bet it wuz the



Deering Manure Spreaders Producers of Good Crops

"MOST machines handle crops—the manure spreader produces crops." There is a lot of food for thought in that sentence. When you have crops ready, you need machines for the harvesting, but before you can have crops you must have fertile soil. Your yields depend on how well you fertilize the soil.

In the choice of a spreader—your crop producer—you cannot be too careful. Avoid all chance of going wrong by choosing a **Deering** manure spreader.

Deering spreaders are built from careful designs based on rigorous field tests; strength in every part makes them last for years; they can be had with an attachment spreading 8 feet wide or more; they are easy loading, and narrow for easy handling in yard, stable and field.

Your **Deering** local agent will show you a **Deering** spreader. If you prefer, write us for our booklet "Why You Should Use a Manure Spreader," and when we send it we will tell you where you can see the machine. Don't buy until you have seen a **Deering** spreader.

COUGHED SO HARD

Would Turn Black In The Face.

SHE WAS CURED BY USING

DR. WOOD'S Norway Pine Syrup.

Mrs. Ernest Adams, Sault Ste. Marie, Ont., writes: "My little girl, six years old, had a dreadful hard cough. At nights she would cough so hard she would get black in the face, and would cough for several hours before she could stop. We tried different kinds of medicines and had several doctors, but failed to do her any good. She could not sleep nor eat her cough was so bad, and she was simply wasting away. A friend advised me to try Dr. Wood's Norway Pine Syrup. I got a bottle and saw an improvement, and got another. Now I am only too glad to recommend it to all mothers."

Too much stress cannot be laid on the fact that a cough or cold should be cured immediately.

Dr. Wood's Norway Pine Syrup will cure the cough or cold and prove a preventative from all throat and lung troubles such as bronchitis, pneumonia and consumption.

"Dr. Wood's" is put up in a yellow wrapper; three pine trees the trade mark; price 25c and 50c, per bottle.

Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

first time Roosevelt wuz ever kep' from talkin' when he wanted to!"

An' for all Josiah's cricketsizin' me and pokin' fun at me, "I'll be fizzled if he didn't act kinder proud on't."

An' sez Miss Gansey (she wuz jealous on me, because I had talked to Roosevelt an' she hadn't): "I presoom he never hearn a word you said. I dare say he wuz restin', an' kinder turnin' over his evenin' lecture in his mind, an' didn't pay no more attention to what you wuz sayin' than if you wuz a muskeeter a buzzin' round his head."

What spiteful things a envious female can say! I wuz never compared to a muskeeter before. But envy wuz what riled her.

Making Our Home Surroundings Cheerful.

"There's not a leaf upon the tree,
There's no blue shred to grace the sky,
Yet some glad spirit whispers me,
The Spring is nigh."

Yes we feel it in every thing. Everything points to thelong-looked-for spring. The dropping leaves tell us that old Sol is getting back his strength, and must make things move.

The sheep take their daily walk, to some sun warmed knoll, where they can taste mother earth again. Birds are twitering to each other among the vines as they make their plans for the nest building, and rearing their tiny brood. In doors the sun shines farther and longer, and the house plants smile back their gratitude by putting out new shoots and blossoms.

Some fairy wand has touched and changed things in a twinkling, but everything under ground and over land learns it before we do. Every root must have felt it, and every bud unconsciously bursts. The birds we know not how—know when to come back to us after wintering in the South, and welcomed by all, is the first robin red breast.

The fish in the depths of the sea, by some unaccountable knowledge, come to the mouths of the rivers, ready to dart up the streams later. The bees and bugs, and all the little creatures that roll and go to sleep, wake up with the coming of spring.

The children gather on the first bare patch of ground. The call comes "Mother find me a ball," then we know for sure that spring is here.

All winter we have been living over our last summer's garden and planning for the next one. The seed catalogues are coming with every mail, and we can hardly wait. December 26th we picked the last boquet—a bunch of mixed stock. The perfume was gone, but the colors bright as in July. Then the snow storms came and there were no more boquets. Still we have had flowers all winter.

A few bulbs planted in October and November and left in the dark to form roots for six or eight weeks, will give a continuous bloom that will brighten your homes, and gladden your hearts all through the dreary winter months. Our collection consisted of a Chinese Sacred Lily, a variety of hyacinths, tulips, narcissus and daffodils, and we have had a succesion of bloom for a few cents.

Our Women's Institute has taken a decided interest in the school garden movement. Last year a very nice garden was the result of some work and considerable talking along this line in our district, while in the adjoining district the home plots were taken up, as the school grounds were not suitable for cultivation. In both cases it proved a success with greater enthusiasm for another year.

Such a movement is catching, especially among children, and this year we expect to see the number of plots doubled.

Many of the flower seeds used were supplied by the institute, and as an education along the lines of the beautiful bulbs for winter blooming were given to the school children. These have proved a great delight to children and parents.

This is but the beginning of what we hope will be carried on by every institute, till all over our province will be felt the uplifting influence of summer and winter flowers.

Manitoba Women Sends Message

TELLS SUFFERING WOMEN TO USE DODD'S KIDNEY PILLS

Mrs. F J. Garlis, Who Suffered With Backache, Says That the Results She Got From Dodd's Kidney Pills Were Wonderful.

Stewart Valley, Sask., April 18 (Special.)—Mrs. F. J. Garlis, wife of an estimable resident of this place, is enthusiastic in her praises of Dodd's Kidney Pills.

"Dodd's Kidney Pills have helped me wonderfully," Mrs. Garlis says in an interview. "A year ago I was so bad with my back I could hardly move. I took four boxes of Dodd's Kidney Pills and they helped me more than I can tell you."

Mrs. Garlis is now able to attend to her household duties as well as nurse her fine big baby boy and she feels that she cannot recommen Dodd's Kidney Pills too highly.

Backache is the bane of the average woman's life. It is accompanied by a weakness and lassitude that makes life a burden. But thousands of women all over Canada are telling their suffering sisters that relief and cure is to be found in Dodd's Kidney Pills. They cure the kidneys and nine-tenths of women's ills come from diseased or disordered kidneys.

B. B. Genuine White Lead links up B. H. "ENGLISH" PAINT with a supremacy record of nearly two centuries.

LINKS IN THE B. B. AND B. H. CHAIN

1729 saw the founding of the firm of Brandram Bros., the inventors of the Brandram Process of corroding White Lead,—a process that produces a lead that has been the standard White Lead of the world ever since.

In **1906** after handling Brandram's White Lead for many years, in the Canadian market, the firm of Brandram-Henderson purchased the Brandram Bros. formulae and exclusive rights to manufacture it in Canada.

In **1909** the final link was forged when the firm decided to use B. B. Genuine White Lead in the manufacture of their B. H. "ENGLISH PAINT and after practical tests and most careful research arrived at an exact formula guaranteed on every can under the President's signature. Thus was the chain completed.

The B. H. "ENGLISH" PAINT formula of 70 units of Brandram's B. B. Genuine White Lead and 30 units of pure White Zinc, in all tints and white with its ironclad guarantee, makes B. H. "ENGLISH" PAINT the Quality-Service-Paint of Canada.

BRANDRAM HENDERSON
Montreal Halifax St. John Toronto Winnipeg

Link up Your Paint needs with B.H. "English" Paint.

I have just been reading the children's magazine "The Schoolmate," started just a year ago, under the supervision of John Lewis, Child's Floral Park, N.Y., and edited by Mrs. Caroline Childs. It is a paper every child should read, being full of nature study. Its articles are by the best authors and certainly educative in the right direction. It only costs 25 cents in single copies, and 10 cents to clubs of twenty.

Mr. Childs seems to be one of those big hearted men who having a good thing wishes to pass it on—and is has a list of flower, vegetable seeds and blubs so low priced to school children that the poorest child can have them. Thousands of children are taking advantage of his generosity, and thus helping him to spread his great flower garden all over North America.

I was much impressed with a sketch of the national plant, flower and fruit guild started by a little slum child in N. Y., asking Mrs. John Wood Stewart—who was carrying a large boquet of wild flowers she had gathered in the country—for a flower. The earnest, wistful face of the child so attracted the lady that she immediately gave her a rose. Mrs. Stewart's sympathies were aroused as she thought of the thousands of just such children in the cities who never smell a flower, and for many days she thought of how the waste blooms of the country might be carried to the poor of the cities.

After a long conference with other women, Mrs. Stewart visited the presidents of six express companies, and found them ready to co-operate with any schemes by which the waste of the country might meet the wants of the city—and so the Free Label was born. It is a bright yellow label, and bears the words "Approved Label."

In its first year the label carried free, two thousand bunches of flowers. In 1914 in New York city alone it carried 295,942 bunches of flowers, 485 bushels of fruit and vegetables, 1932 glasses of jelly, and more than 5000 potted plants and bulbs. In its twenty years existence this magic label has carried six millions of flowers to the sick poor of the big city, and thousands of bushels of fruit and vegetables that otherwise would have decayed on the ground. A fee of one dollar per member pays for printing the labels.

Is this not an idea for our Institute workers, even if we do steal it from our friends across the border?—A. M. S., P.E.I. Women's Institute.

"Look for the Paroid Roll"

The Least Expensive Roofing in the World

A WEATHER-PROOF, fire-resisting roof is the only roof worth laying. You cannot afford any other kind of roof—the danger of damage to your stock is too great, the cost of repairs in time and money burdensome.

Back of every roll of the Genuine Paroid Roofing is a record of 18 years' hard service under the most trying conditions, on farm buildings, factories and railroad buildings.

NEPONSET Paroid ROOFING

Hundreds of Paroid Roofs laid 18 years ago are in perfect condition to-day. Paroid is proof against raging gales, beating rain storms, free ing winters, melting snows, the burning summer sun—the most severe conditions serve but to show just how good a Paroid Roof really is. Paroid is less expensive than shingles, lasts longer and is far better protection from fire.

Look for the Paroid Roll

By it you will know one of the 2,000 Neponset dealers in Canada.

Paroid is made in three colors—Grey, Green and Red.

Send for free booklet, Repairing and Building."

Neponset Wall Board

For Walls, Ceilings and Partitions, in place of lath, plaster and lumber. A Tough board nearly one-quarter of an inch thick, finished ready for use, in Cream White and Quartered Oak patterns. Cream White finish can be painted if desired.

BIRD & SON, DEPT. M,
70 KING STREET, HAMILTON, ONTARIO.
Warehouses: Winnipeg, Calgary, Vancouver, Montreal, Halifax, St. John, Edmonton.
The Largest Manufacturers of Roofings, Wall Board and Roofing Felts in Canada.

To Make Colors Fast.

To preserve the colors of ginghams, printed tawns, &c., and before washing almost any colored fabrics it is recommended to soak them for some time in water to every gallon of which is added a spoonful of ox gall. A strong, clear tea of common hay will preserve the color of French linens. Vinegar in the rinsing water for pink and green fabrics will brighten these colors, and soda answers the same purpose for both purple and blue. The colors of the above fabrics may be preserved by using a strong, milk-warm lather of white soap, putting the dress into it instead of rubbing it on the material and stirring into a fast and second tub of rinsing water a large tablespoonful of ox gall. To prepare ox gall for washing colored articles, empty it into a bottle, put it it a handful of salt, and keep it closely corked. A teacupful to five gallons of the rinsing water will suffice.

Housework as Physical Culture.

There is nothing like housework for physical culture. In the various complex movements performed by the different sets of muscles during the innumerable evolutions incidental to housework, we have an admirable system of gymnastics peculiarly adapted to the needs of women. A certain amount of exercise which arouses and interests the mental faculties, while occupying the activities of the bodily organs is necessary to health and housework undoubtedly complies with both of those conditions. In many a household the daughters take their share of the lighter branches of the work, but in many another establishment dusting is considered undignified, polishing plebeian, and bed-making a bore, and so the womenfolk leave the work to hired hands, while they amuse themselves at so-called physical culture classes, where perhaps, they beat the air with Indian clubs, a form of exercise considered more dignified, if less useful, than beating carpets with rattan canes.

Heart Was So Weak Could Not Go Up Stairs Without Help.

When the heart becomes weak and does not do its work properly the nerves become unstrung and the whole system seems to go "all to pieces."

When this happens you need a tonic to build up both the heart and nerves, and Milburn's Heart and Nerve Pills will accomplish this for you, providing you to not let your case run too long and allow it to become chronic.

Mrs. Evangiliste Loverdure, Fort Coulonge, Que., writes: "Last summer my heart and nerves were so bad I could not sleep at night, and my heart was so weak I could not go up stairs without help. My doctor said he could do no more for me as my heart was completely done. A cousin of mine came in one day and told me that Milburn's Heart and Nerve Pills cured her completely. I immediately gave her 50 cents to bring me a box, and since that day there is a box always on my sideboard. I am now well, and my heart and nerves are stronger than when I was a little school girl. I advise anyone with heart trouble to try them. No doctor can beat them."

Milburn's Heart and Nerve Pills are 50c per box, 3 boxes for $1.25; for sale at all dealers; mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

BEWARE OF IMITATIONS SOLD ON THE MERITS OF MINARD'S LINIMENT

Minard's Liniment Co., Limited.

The Prevention of Typhoid Fever.

Issued by the Department of the Public Health, Nova Scotia.

As the season in which typhoid fever is usually most prevalent is approaching, a reference to this disease is appropriate. Last summer a press bulletin issued by this Department stated that typhoid was relatively less prevalent in Nova Scotia than in most countries in the North American Continent, but unfortunately the statistims for 1914 show that there were fifty per cent more deaths from this disease in our Province last year than during either of the three immediately preceding years. As typhoid is a disease which is usually communicated from individual to individual, its exceptional prevalence last year should warn us of the need for taking especial precautions this summer.

The germ which causes typhoid is given off by the discharges of those who are ill of or convalescent from the disease. Sometimes it persists in the discharges for many years, in those who are termed "typhoid carriers." Such carriers have been responsible for many localized epidemics. The celebrated "Typhoid Mary," a not very cleanly cook has been the cause of so many of these epidemics that she is now being kept in detention by the New York City Depart ment of Health.

The typhoid germ is usually taken into the body with food and water. It gains access to water because of careless disposal of the excreta of typhoid patients. Flies are frequently responsible for carrying the infection from such excreta, or from the sick room, to food. Those who are caring for typhoid patients, and those who have had the disease and are "carriers," may infect food if they are not particular about cleansing their hands before preparing or handling food.

The spread of the disease is to be prevented by carefully disinfecting all discharges and the soiled clothing of typhoid patients, by thorough cleanliness on the part of those who nurse or care for such patients, and by the proper protection of all foodstuffs against contamination by flies, dust, etc. Dealers and caterers who do not protect their wares against flies and dust should not be patronized. Water from any suspicious source should be boiled before use, and a similar precaution is advisable in the case of milk.

Vaccination against typhoid has proved so successful that it is to be strongly advised when one lives in or must go to a community in which tyhoid exists.

The Department of Public Health, Nova Scotia, issues a leaflet containing instructions for those who have to minister to typhoid patients, which may be obtained free upon application to the Provincial Health Officer, Halifax, or to any Medical Officer in the Province.

How to Build a Gown by Commercial Patterns.

"In using the commercial pattern," says Miss Beryl Dixon, Colorado Agricultural College, Fort Collins, "first of all be sure that all directions on the envelope are understood. Notice whether or not seams are allowed. Notice also the marks indicatin folds and legthwise threads.

"Next hold the pieces of the pattern up to the person for whom the garment is intended. If the skirt is too long, lay a tuck in the pattern midway between the hip line and the bottom of the skirt. If it is too short, cut across the pattern in the same place and insert a piece of paper. The waist should be corrected in the same way, the change usually being made half way between the lowest point in the arm hole and the waist line. The sleeve should be corrected both above and below the elbow, half of the difference being taken out in each place.

"All parts of the pattern should be placed on the material before any one piece is cut. Notice right and wrong sides of material and ups and downs if there be any. Pin in place using pins at right angles to edge of pattern as this makes tracing easier.

"Cut around the outline of the pattern. Trace seam allowances and notches showing how pieces go together. Never cut notches, as this

Medicine Chest Valuable Adjunct to any Home.

"There was a time when the average woman depended almost entirely upon drugs for the treatment of disease. Although science has made many advances, drugs are less depended upon, than sanitary measures and a knowledge of hygience," writes Miss Alice J. Barnard, of the Colorado Agricultural College, Fort Collins. "Every woman may make herself familiar with the facts essential to her usefulness in the sick room by reading and observation. She needs to have a speaking acquaintance with some of the more common accidents and ills, together with a knowledge of their prevention, intervention and cure.

"A simple medicine chest, inexpensively equipped, may prove a valuable edition to any home, especially when the doctor and the drug store are far away.

"It is not always necessary to have an expensive cabinet. A plain box about 20 inches long, 14 inches wide and 6 inches deep, or even a spool box, may be used. It should be varnished on the outside with oak stain, on the inside with white enamel. If two shelves were arranged propertionately across the width, sufficient space would be allowed for the bottles and utensile. The case should be placed in a well lighted, convenient place and at good height.

"The bottles containing poison should not only be well labeled and out of reach of children, but they should have rough surfaces, in order that no mistake may be made in giving medicine."

How to care for your Linoleum.

Alkaline Cleansing Agents and Hot Water Should Not Be Used.

Linoleum is made of linseed oil, rosin, and ground cork, with mineral coloring matters. In cleansing and renovating linoleum, the above ingredients should be taken into account. Therefore, linoleum should not be washed with soap, soda or other alkaline cleansing agent. Neither should hot water be used on it.

To clean linoleum properly, it should be first swept gently, then wiped up with a damp cloth. The surface should be treated every two or three months with some good floor wax, well rubbed in. A solution that may be used to preserve and renovate linoleum is the following: Dissolve two and one-half pounds paraffin in one gallon of oil of turpentine, using gentle heat; apply while warm with a piece of flannel; let remain on the linoleum about twenty-four hours, then polish with flannel.

New linoleum should be warmed before unrolling or bending, as it cracks very easily when cold. Furniture should not be rolled or skidded over linoleum, but lifted and carried. Small blocks of wood or scraps of linoleum placed under furniture casters prevent unsightly denting.

The greatest amount of wear on linoleum comes, naturally, from walking over it. Plain linoleum shows such wear much less than figured, which often becomes unsigthly from "paths" and worn patches. This is especially true of the cheaper printed linoleums. When properly laid and cared for, however, the very best inlaid linoleums are quite satisfactory, and are the cheapest in the long run.—C. E. Vail, Colorado Agricultural College, Fort Collins, Colorado.

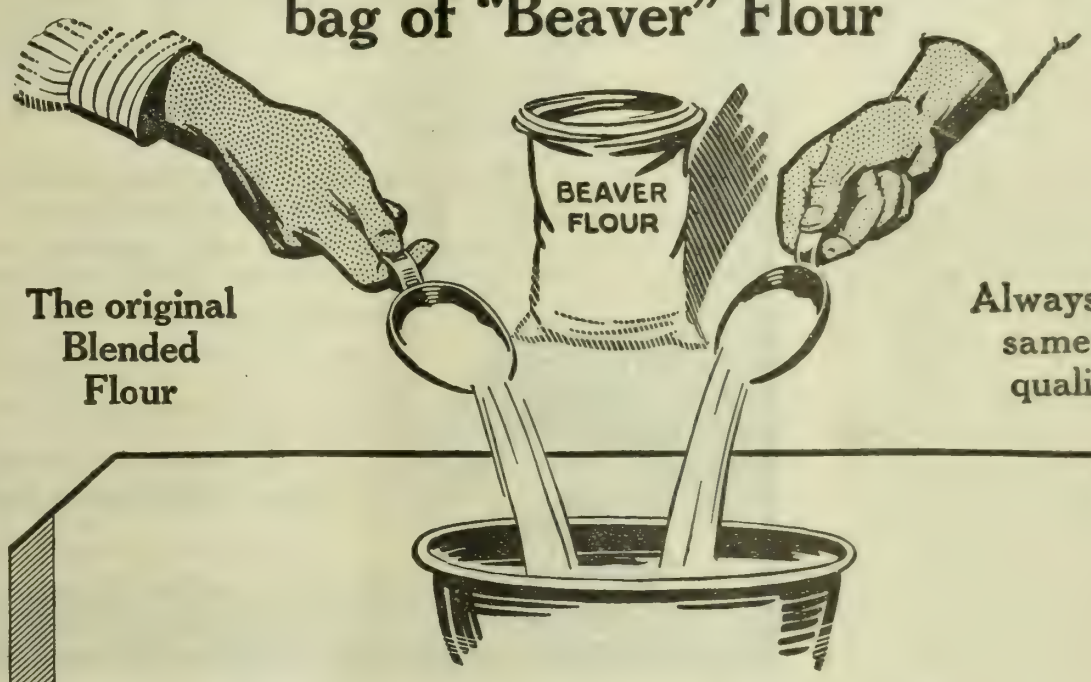
Here's your Bread Flour and your Pastry Flour, both from the same bag of "Beaver" Flour



The original Blended Flour

Always the same in quality

THE only flour that can make perfect Bread and perfect Pastry, is that flour which has the delightful flavor, the whiteness and lightness, of Ontario wheat flour with the strength of western wheat.

"Beaver" Flour has this perfect balance. It contains the quality, flavor, lightness and whiteness of the choicest Ontario wheat—and its strength is increased by the addition of Manitoba wheat.

By blending these two wheats in exact proportions, "Beaver" Flour gives you the best qualities of both—and is equally good for Bread, Rolls and Biscuits, Cake, Pies and Pastry.

Don't go to the trouble of keeping two flours in the house. Get "Beaver" Flour—the bread and pastry flour—the original blended flour.

Varaties of Potatoes Suited to N. B.

(Continued from Page 450.)

ably. The Prolific was somewhat rougher than the others, but a great yielder, and the quality was quite equal to the others named. This group differs but little from the Green Mountain group, except that the shape is apt to be more irregular and the sprouts start with a bluish tinge instead of being perfectly white, as with the Green Mountains.

There are other distinctive types and varieties, such as deep red-skinned potatoes, of which a variety called Dakota Red or Susy was considerably grown in New Brunswick years ago. They were heavy yielders, free from disease, rather rough and deep-eyed, but were wonderful potatoes to keep in the cellar, coming out in May and June as firm as they went in. There was also a potato known as the California or Jenny Lind, which was an enormous cropper, but a long rough tuber and not fit for table purposes. A somewhat similar potato is the Chenango, grown on Prince Edward Island. A black potato, round and rough, a large yielder with very deep eyes called Markee, which was a long keeper like the Dakota Red, but of excellent quality, was also extensively grown and was a good spring seller in the St. John market.

Several dark and purple skinned potatoes are grown and are sold locally. In York county a long, somewhat rough potato of dark skin, is called the McCullough. I understand that much the same sort of potato is called McIntyre in parts of Carleton and Victoria counties. On Prince Edward Island the McIntyre is a round, dark-skinned potato of great vigor and especially disease resistant. The king of all potatoes on the St. John market and among potato epicures, anywhere it can be procured is the Black Kidney. It has been rather a hard potato to grow, except in a few restricted localities and by only some men there.

The New Brunswick grower who made the greatest success and some money in growing this variety, was Felix McGarr, Burton, Sunbury County. Mr. McGarr has told me that he found it necessary to keep up his stock by breeding over, every few years through the blossom. Mr. McGarr sold his farm three years ago, so his work is discontinued, but some of his neighbors are still growing Black Kidneys and getting good crops.

I do not pretend that this paper deals thoroughly with this question of varities. There are various types which I have not mentioned at all, and there are hundreds not worth considering. It is the desire of the Experimental Farms system to do what it can along the line of potato improvement, the testing of varieties, methods of growing, etc., and I hope that when, in the near future, we have plenty of clean land available at the Fredericton Station, we will be able to extend our work and obtain results and information of some value to our potato growers.—Address at the New Brunswick Potato Growers' Convention.

Potato Improvement and Seed Collection.

(Continued from page 451.)

time of tuber formation—has a greater effect on the vitality of the tuber than a check during its later development.

It might be of interest for me to mention my experience at Macdonald College where we grew about 20 acres of potatoes for use at the College. I found it impossible to secure a profitable crop without importing New Brunswick seed each year. The summers were hot, and very dry, which condition it seems brings about a tuber development lacking in vitality. The crop looked good for seed, but when planted alongside imported seed it would not produce a crop by one-third as good, and the second year was about worthless. Thus a potato tuber may be so weakened in vitality in one season as to be worthless for profitable crop production under certain soil conditions. The Macdonald College soil is a favorable one for Rhizoctonia, and in the fall at digging time the tubers were covered with the black spots indicating the presence of this disease.

Here again then were conditions that were successfully combatted only by using seed from sections where tubers of high vitality were produced. The soil was so impregnated with the disease that treating the tubers was of no value. The low vitality in the tuber grown from imported seed was without doubt largely due to the heat and absence of moisture rather than rhizoctonia, although this was a factor as well, but the crop from these tubers the following year was a failure primarily because the sprouts of the tubers were not sufficiently vigorous to resist the rhizoctonia fungus.

No amount of selection work—and

we did such work for four years—ever gave us results that compared at all favorably with imported stock, and this leads me to believe that in very many cases potato growers must depend upon stock from sections where climatic and soil conditions are entirely favorable for the crop.

I mention this disease for the purpose of pointing out what factors may combine to reduce yield and to indicate the importance of high vitality in resisting certain unfavorable conditions. I do not do so for the purpose of placing this disease before you as the only one which may cause a distinct loss in the lessening of vitality. This disease may not be a factor at all with many of you, but it certainly is a disease that is not receiving the attention it should at the hands of our plant disease investigators.

Disease ns not the only factor that may bring about lessened vitality. In fact, as already pointed out the lack of vitality may be due to heat, drought, or excessive moisture, and these are influenced by climatic conditions, kind of soil and method of soil management.

Unfavorable conditions during growth must necessarily weaken the vitality of the potato, and the wise grower is the man who selects from his best fields where normal growth has been made, or if his neighbor has produced better crops makes his selection from his field.

To illustrate we will assume that the numbers in this table represents individual farms, where would you go for seed stock? You certainly would go to either farm No. 1, 3, 4 or 7. Here then is where I think potato improvement should start. What is the good sense in farmers No. 5, 6, 8 and 2 doing hill selection work when they could go to farmers No. 1, 3 4, or 7 and get probably better seed stock than they cuold get by selection from their field in probably five years and in the meantime be growing poorer crops while working up their production. My experience at Macdonald College shows quite conclusively that selection work under such conditions is an absolute waste of time, and that tubers from any unselected lot of potatoes from sections where this crop has better climatic conditions for their development proved superior by over one-half to the best selected stock we could produce.

Potatoes grown in New Brunswick are as a general rule of strong vitality, but even here it is quite possible you will find a vast difference in the vigor of the same variety in different farms. Would it not be possible for farmers to organize in certain sections for the purpose of growing under the same conditions seed from the different farms in the section? If this is done and the seed of strongest vitality determined it would serve as a basis for future effective selection work to low vitality in his seed stock. My experience leads me to believe that there is as much difference between the same variety from different varieties grown under similar conditions. We should therefore before starting selection work round up the groups of strongest vitality and use these for selection work.

I am in favor of hill selection with good stock to start with but it seems to me it will be better for all concerned to place hill selection work in the hands of certain ones rather than for each to attempt to do the work himself. I am convinced that there is more difference in the product from different fields than there will be from selected and unselected hills in the same field. I can see no good reason why the individuals of a community should not co-operate to the extent of using for seed stock the best potatoes in that community, and after the best sotck of the community is determined stock from different communities could be compared. If I know that my seed stock is 10 per cent lower in vitality than my neighbors I certainly am likely to get my seed stock from my neighbor. Furthermore, if we hope to build up a seed potato trade, which I have always maintained this Province is eminently suited for, we must adopt some such system rather than that every one in the community should grow indiscriminately whatever may in his opinion suit him best without considering the community interest as a whole.

By selection from the strongest and best yielding hills at digging time we are reasonably sure of improving the stock. This enables us to reject plants which for one reason or another has not done as well as others. This involves some extra work which must be done by hand, and while it is not necessary that large amounts be selected, as this is to serve only as foundation stock from which to grow the general stock for planting, it is necessary that care be taken to select hills of uniform tubers true to type of strong vitality, and productive.—Prof. W. S. Blair at the New Brunswick Potato Growers' Convention.

LOUDEN Roller Bearing Litter Carriers

—make quick, easy work of stable cleaning. No bother with brakes or ratchets. Loads easily elevated; a light pull on hand chain does it. Box loaded or empty will stand at any height. Stable Notes.

(Continued from Page 461.)

soft soap and warm water are employed—the circulation, which has been excited by the warm water, becoming suddenly checked by the effects of cold air and the wet coat, and the vessels become congested and superficial inflammation follows. A good deal might be said generally about the disadvantage of light colors in horses, especially those that fade towards the extremities, but enough, perhaps, has been said to show the dangerous tendency of making utility a secondary consideration when show points are in question.

Rations for the Entire Cart Horse.

It is always a difficult matter to prescribe exact rations, even for individual working horses the character and amount of whose labor can only be approximately stated. For the management and feeding of stallions kept wholly or in part for service purposes there can be no exact formula. The constitution and individual requirements of the horse, difference in country and climate, the number of mraes to be served, and whether the horse "stands" or "travels," make such a thing an utter impossibility. It goes without saying that the food of the travelling horse in full service should be highly nutrient, and calculated to keep the animal in high "hard" condition without loading the system with fat. The best of old oats in generous quantities, a moderate allowance of prime picked hay, the bulk of which is chaffed and the balance given at night, a few carrots, some old crushed beans or white peas, and an occasional mash of bran and linseed on the eve of a rest day, form the usual diet for the stallion in full service. It has been experimentally demonstrated that the requirements of a working horse may be met roughly by giving 2 lb. 14 oz. of oats and 1 lb. 10 oz. of hay for every 220 lb. of live weight. It is a good basis to start on; then give the additions as required for the special service the animal is called upon to perform. The use of condiments and stimulants is not necessary, and drugs, except in cases of temporary indisposition, are best avoided. In getting the animal into condition it is a good plan to give a few bran mashes, and, if considered desirable, a dose of physic or a few doses of alterative powder. When the physic has set, one should begin walking exercise, and gradually introduce the corn, increasing both it and the exercise until the maximum is attained. If a stallion does not travel, and is not worked, he should be led at six miles every day, and ten would be better. There is nothing so conducive to good health and certain stock-getting as plenty of exercise and the avoidance of anything approaching fatness. Much of the disappointment with overfeeding stallion used for service is due to overfeeding and insufficient exercise. At the same time, the animal must be fed so as to compensate for the exhausting character of his work. The owner or attendant, if properly qualified to look after such an animal, should be able to judge of sufficiency. With the man there is generally a tendency to over rather than to under-feed.

Over-shot Fetlocks.

Where horses are broken in too early, or before properly developed, and while their bones, tendons, and ligaments are weak, or where young horses are rattled at too fast a pace, or any horse is over-driven, overloaded, or over-worked in any way, especially in hilly districts, the result is that they "go over in front," and the owner expects that a blister and a few weeks' rest at grass will put the matter right. It does not, as a rule, effect anything like a perfect resoration where Nature has been badly outraged, but it is the best thing to do, and if the mischief is not too great and

Everybody wants to bake—when the

GURNEY-OXFORD "CHANCELLOR"

The Range every woman always wants!

$54.75

No matter where you go in the British Empire your money cannot buy better value than the Gurney-Oxford "Chancellor" at this price. That we know and guarantee. This price includes freight to any point as far west as Fort William.

This sensational value is typical of our new low prices.

The "Chancellor" represents the very highest quality it is possible to put into a stove at any price. It is a stove that delights our expert designers because they had unlimited time and resources in which to perfect it. Your Gurney-Oxford "Chancellor" can be only a source of absolute satisfaction and economy all the days of your life.

The Gurney Enormous Output is alone responsible for these exceptionally freight-paid prices on Canada's finest steel ranges. Our huge foundries, the largest stove and heating apparatus works in the British Empire, enable us to do a tremendous volume of business at a small rate of profit.

100 Days After Buying to Decide Whether you will keep your Gurney-Oxford Range is our added guarantee for your safety. Such a wide, sweeping guarantee was never before made by a house of stove specialists the size of the Gurney Foundry Co. It shows we build the Gurney-Oxford Stoves to make good. It shows they are bound to be lighter on fuel—have more genuine conveniences, cook better, juicier roasts --bake lighter, browner bread and pastry than any stove you ever saw at the price or they will be back on our hands.

70 Years of Gurney Success

The Gurney name is a household word throughout Canada for the highest quality in stoves. Three generations of the Gurney family have specialized on the buying of raw materials, on up-to-date foundry methods, on correct stove designing, on putting in all the quality and improvements that brains, skill and capital could suggest. We have done everything but set the selling price.

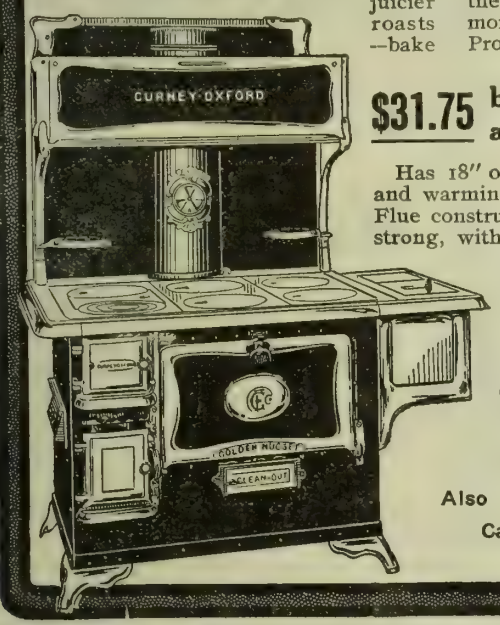
From now on the factory will set new low fixed prices for every Gurney-Oxford Stove. This plan will take all the dickering and uncertainty out of stove buying and will guarantee you the utmost stove value for the least money. Our new catalogue "The Stove Problem Solved" gives you full particulars.

The splendid guaranteed 20" oven is the pride of the Gurney-Oxford "Chancellor." Our patented system of Divided Flues compels the fire to heat the oven evenly. Means perfect, even baking and a big fuel saving. Large Reservoir that really heats water; tea shelf, warming closet. Shipping weight 535 lbs.

The Gurney-Oxford Economizer is a patented device for controlling the draft; very easy to use, worth the price of the Range as it means a saving of one ton of coal in five.

Plain, rich-looking body of the "Chancellor" is high-est grade blue steel with steeple headed rivets artistically hand. Roomy top, with corner to keep Fire Box has exclusive design for dumping ashes and clinkers.

Grates for hard coal and coal or wood.



$31.75 buys the GOLDEN NUGGET a smaller, beautifully built Range

Has 18" oven (20" oven $34.25), 6 covers, reservoir and warming closet, famous Gurney-Oxford Divided Flue construction; Duplex Grates and scientific fire-box, very strong, with heavy steel-plate construction; non-sagging top; certain to give life-long satisfaction. Prices include freight as far west as Fort William.

"The Stove Problem Solved"

It shows you how "Canada's quality stoves" are made. Takes you on a trip through the great Gurney foundries. Gives you page after page of knowledge of how to buy your stove. Shows the full Gurney-Oxford line of steel and Iron Ranges, Self Feeders, Heaters of all kinds, Furnaces, Boilers, etc. Plain fixed prices quoted all through. Over 70 years stove knowledge from making more than one million stoves packed into this Catalog. It's free. It will mean cash in your pocket—have it.

You ought to send now. A postal will do. Address at left.

the rest is a long one, and taken under favorable conditions, it often happens that there is a temporary improvement, which is maintained until the animal is put to work again. But there are other cases of over-shot fetlocks that are not so much due to work as to natural weakness, and where there exists a condition amounting to partial luxation of the fetlocks. This is often seen in the hind joints, especially of weedy bloods, and is for all practical purposes incurable.

Official Records of Holstein-Priesian Cows.

The following records of Maritime cows are recorded in the March 1st to 15th list recently issued.

Senior four-year-old Class.

Dorris of Pleasant Valley, owned by A. E. Dickie, Central Onslow, N. S., 521.8 lbs. milk, yielding 21.18 lbs. butter.

Four-year-old Class.

Ormsby Belle, owned by Lea and Clark, Victoria, P.E.I., 470.5 lbs. milk. yielding 19.09 lbs. butter.

Junior Three-year-old Class.

Homestead Lass, owned by R. L. Hicks, Dalhousie Jct., N. B., 10-day record, 759.2 lbs. milk, yielding 34.85 lbs. butter.

Junior Two-year-old Class.

Milly Pontiac Pledge, owned by R. L. Hicks, 284.7 lbs. milk, yielding 11.37 lbs. butter in seven days.

A Change what a Pure Bred Sire Makes.

With the first cross of a pure bred sire with an ordinary herd of cows the resulting heifers will have 50 per cent of the blood of the sire. The second cross brings heifers with 75 per cent. The third cross gives 87½ per cent and the fourth cross nearly 94 per cent. Fourth generation females when bred to a pure bred sire of agreeing blood have only about six per cent of the scrub blood to contend against the blood of the sire. All subsequent breeding should be in line, for then the progeny has the advantage of the strong impulse of pure bred blood on both sides.

But some f armers are unwise in their subsequent breeding. They are quite apt to change breeds, thinking wrongly that they are going to get the best qualities of both the breeds. Almost invariably the result is one of disappointment for there is set up at once a warring of two prepotencies, that of the sire and that of the dam. Very much better cows will be produced by keeping the herd stadily in line with the blood of the original sire.

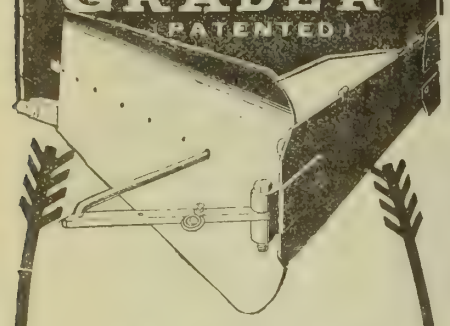
But the farther on this road we go the more careful we should be always to select bulls of strong prepotency. When we change sires it is best to select one that has a fairly close family relationship. In this way we take advantage for a progency of agreeing and not contending tendecies.

By making a close study of this matter a farmer can build up in a few years a splendid herd of grade cows which will command a big price whenever offered for sale.

But very rigid selection should be maintained by selling off the older as well as the poorer cows, keeping the heifers to prove correctness of the breeding theories that have been followed.

RED ROSE TEA "is good tea"

The Martin Farm
DITCHER
and Road
GRADER
(PATENTED)



$47.50

For this small sum you can own this wonderful Ditcher and Grader—a necessity on every farm—it will clean out your ditches—run the water off your low lands—dig your tile drains to 2 or 3 feet. It will do in one day the work of 50 men with picks and shovels. It pays for itself with its *first* day's work.

Protrusion of the Rectum in Pigs

(continued from page 459.)

Treatment.

In the case of young pigs, return is greatly facilitated by holding them head downwards, or, in the case of heavier, older animals, by standing them with the head down hill, or raising the hind parts by packing them with litter. This, and pinching the animal over the loins, will prevent straining to a considerable extent, and so tend towards retention. In cases due to constipation a dose of castor oil should be given, and its action assisted by in jection of tepid water to which glycerine has been added. Success may be confidently looked for if attention is paid to the diet, and especially if, instead of blowing the youngsters out like drums with a lot of sloppy stuff, they are given only a little corn to allay their hunger for a day or two, the old diet being gradually resumed. In the case of heavy hogs, and especially old sows, it is often most difficult, in some cases impossible, to return and retain the gut. Such animals are difficult to control, they are sometimes savage, and all their strength is invariably opposed to the efforts of the operator.

In applying sutures, the greatest difficulty is experienced with those cases in which the rectum is protruded before or during parturition. Better than sutures roughly inserted is the instrument know as West's anal clamp. It is much less irritating, less likely to be torn out, and more easily inserted and removed for the purpose of permitting the rectum to be emptied, than sutures. In those cases where the protruded organ cannot be returned and retained—and they are not infrequently met with—or where the size and ferocity of an old sow prevent mechanical assistance being given, it is best to apply an astringent dressing and let the rectum shorten itself, partly by strangulation and sloughing of the outer portion, and partly by shrinking into its proper position. For this purpose an ointment of one part of dried powdered alum and five parts of lard is recommended; but wherever possible mechanical assistance should be given, and an early attempt made to return and retain the protruded organ.—Veteran.

Closing of the Agricultural College

Owing to a number of students enlisting in active military service, and owing to others wishing to get home early to help speed up farm production, the College of Agriculture was closed some two weeks before the advertised date. Those who spoke at the closing were Monseigneur Kennedy of Truro; Rev. W. P. Grant, Truro; Principal Soloan and Principal Cumming.

In the Principal's opening speech, some interesting facts in regard to the College were given. He stated that the enrolled attendance, 58, for the year was just about half of the enrolled attendance prior to the war. He further stated that this was the completion of the eleventh session at the College of Agriculture, and that during these eleven sessions some 445 students had been enrolled. Accurate statistics are not yet available, but as near as he could estimate, 85 per cent of these were now farming for the most part in the Maritime Provinces. 170 had completed the couse and had been awarded the Associate Diploma of the College. Added to this number were 21 who would receive a Diploma at the present time. Somewhere between 80 and 100 of the ex-students were now wearing the King's uniform, a number likely to be considerably increased in the course of next month. Of those who had received the College Diploma 28 now occupied professional positions in Departments of Agriculture and Agricul-

Farmers' Clubs Find Us Satisfactory

We are doing a splendid trade with Farmers' Clubs and our

Cream of the West Flour

the hard wheat flour guaranteed for bread

is giving every satisfaction. For example, here is a letter received from Mr. Hester W. Healy, Secretary of the Cleveland Farmers' Club, with headquarters at Richmond, P. Q.

Dear Sirs :—

I wish to say that you have given us the very best satisfaction, and the quality of feed and flour has been fine. We may not order any more this Spring, as we think that we will have enough to carry us through to grass. If we find that we can use another car this Spring we will certainly give you the order. We will be in the business next Fall again, and will very likely use more next season than this.

Our ***Cream of the West*** is a strong, nutritious, light-raising Western Wheat flour that makes the finest of home-made bread.

Queen City Flour is a blend of Ontario and Western Wheat—an excellent all-round bread and pastry flour.

Monarch Pastry Flour is milled from Ontario soft wheat exclusively for pastry purposes.

(West) TORONTO, CANADA

or to our special representative

H. E. RAINS, 112 Lawrence St., Halifax, N. S.

tural Colleges. He was glad to be able to state that while the vast majority of the ex-students were in the Maritime Provinces, yet those who had gone elsewhere were now occupying prominent positions. Among these were E. S. Archibald, Dominion Animal Hunsbanman, Ottawa; Elton Lewis (now deceased), formerly Superintendent of Exhibitions, Alberta; P. H. Moore, Superintendent Dominion Government Experimental Farm, Agassiz, B.C.; G. H. Unwin, teaching at Agricultural College, Guelph; W. V. Longley, Principal Agricultural High School Minnesota; N. McKay District Representative, Province of Ontario; W. H. Porter, F. E. Ellis and G. E. O'Brien engaged in agricultural journalism; Lorn Smith, Assistant State Entomologist, Virginia; E. M. Straight, County Demonstrator, Maine; J. G. Taggart, Staff Agricultural School, Alberta; M. B. Davis, Assistant Dominion Horticulturist, and others.

Touching reference was made to the decease of Cuthbert Shipton, a graduate of 1912 who had failed on the fields of Flanders, and reference was also made to the fact that B. H. Landels who a year ago had been on the staff of the College had also been wounded while fighting in Flanders.

The highest standing of the year was made by W. DeLong of Acaciaville, Digby Co., who wins the Governor General's M dal. The keenest competition was for Premier Murray's Cup awarded to the student making the highest standing in live stock judging. The winner was Thomas C. Munn of Leitche's Creek, C.B., but only four points separated the three leading competitors, the others being L. T. Chapman of Hastings, Cumberland Co., and W. A. Flemming, of Truro, N.S. The cup for the best judging of seeds was won by H. St. Clair Cutten of Lower Truro.

With reference to the opening of the College next year it was stated that five of the teaching staff were now wearing khaki and that moreover the continuance of the war would no doubt lead to a further thinning of the ranks of the student body. However, it was stated that plans would be made to continue the work as usual and that applications for entrance to the College in November next would be regularly rceieved and that a decision in regard to the course to be pursued would be announced shortly after mid-summer.

Fire Prevention in the Home.

Clean-up Day is as Necessary Inside the Home as Outside.

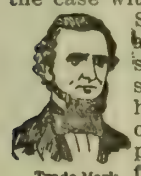
Carelessness is credited with seventy-five per cent of Canada's enormous fire loss. During 1915 no fewer than 676 fires occurred in dwelling houses. Of this number it is safe to say that a great majority were attributed to the threadbare excuse "cause unknown." Were the cause of many of these fires correctly reported, it would be "careless and untidy housekeeping."

Cleau-up day is as necessary inside the house as out. Closets, attics and other out-of-the-way places harbor accumulations of old clothes, discarded furniture, books, waste paper, etc., all greatly increasing the fire hazard. Matches left in the pockets of clothes may easily ignite from friction in swinging against a wall. Sparks from a crack in the chimney passing through an attic may start a fire among the contents. Defective stovepipes and flues, accumulations of dust, etc., in hot air pipes, wood and inflammable material too near furnaces, are constantly causing fires in dwelling houses.

Canada cannot afford to continue this enormous sacrifice of her created resources. An average annual fire loss of approximately $23,000,000 for the past five years constitutes the blackest record of any country in the world. When all our power, both financial and physical, is required for the great task in hand, the housewives in Canada should carefully and consistently clean up their homes remedy all dangerous conditions, remove inflammable material, and assist in reducing the enormous drain which is taxing the financial resources of our people and our country.

Worms in Children

Worms are a danger to the health of a child. Make sure that such is not the case with your child.



Trade Mark

Signs of worms in children are: Deranged stomach, swollen upper lip, sour stomach, offensive breath, hard and full belly with occasional gripings and pains about the naval, pale face of leaden tint, eyes heavy and dull, twitching eyelids, itching of the nose, itching of the rectum, short dry cough, grinding of the teeth, little red points sticking out on tongue, starting during sleep, slow fever.

If at all doubtful, make certain of health by using Dr. True's Elixir, the Family Laxative and Worm Expeller. It's the one best thing for regulating the stomach and bowels and expelling worms. At your dealer's 35c, 50c and $1.00. Advice free. Special treatment for tapeworms. Send for book.

Knowlton, Que. Dr. True

Nervous Dyspepsia

The Modern Scourge
and How to Meet it.

The speed at which we live, the hustle now so necessary for success have unfortunately a very adverse effect on the nervous and digestive systems of Canadians. The baneful results, increased lately to an alarming degree, often lay the seeds of more deadly trouble, but it will be satisfactory to learn of the ever-increasing popularity in the Dominion, of the Great British Remedy, Dr. Cassell's Tablets.

Dr. Ramsay Colles, J.P. of the City of Dublin, a man of high eminence in the scientific world, says :—" I have great pleasure in expressing my satisfaction as to the curative effect of Dr. Cassell's Tablets in cases of nerve troubles. From several cases which have lately come under my notice I am able to form the opinion that Dr. Cassell's Tablets constitute a safe and reliable family remedy, and appear to be specially effective for nerve and bodily weakness."

Dr. Cassell's Tablets are Nutritive, Restorative, Alterative, and Anti-Spasmodic, and of great therapeutic value in all derangements of the Nerve, Digestive, and Functional Systems in old or young. They are the recognised modern home remedy for Dyspepsia, Nervous Breakdown, Stomach Catarrh, Kidney Disease, Nerve and Spinal Paralysis, Infantile Paralysis, Rickets, St. Vitus' Dance, Anæmia, Sleeplessness, Brain Fag, Headache, Palpitation, Wasting Diseases, Vital Exhaustion, Loss of Flesh, and Premature Decay. Specially valuable for Nursing Mothers and during the Critical Periods of Life.

Druggists and Dealers throughout Canada sell Dr. Cassell's Tablets. If not procurable in your city send to the sole agents, Harold F. Ritchie & Co., Ltd., 10, McCaul Street, Toronto; 1 tube 50 cents, 6 tubes for the price of five.

Sole Proprietors:—Dr. Cassell's Co., Ltd., Manchester, Eng.

WALTER PAYNE,
Bluebell View Farm, Lake Edward, N. B.

Maple Green Farm Holsteins

To avoid inbreeding, we now offer for sale our senior herd bull "Maple Grove Mercena Mercedes," coming 5 years old; weight about 2500 lbs., active, sure and exceptionally kind. His first daughter to be officially tested made 15.46 lbs. butter in 7 days at 1 year and 11 mos.; another at 2 years and 2 mos. was making nearly 3 lbs butter per day when she met with an accident and we had to drop testing her. His dam gave 12664 lbs. milk and 568 lbs. butter at 2 yrs. old in the R.O.P., and her sister Posch Mercedes Springbank 2nd, is the Canadian Champion 4 yr. old in the R.O.P. with 22000 lbs. milk and over 800 lbs. butter in the year. We are also offering Bull and Heifer Calves sired by him and "King Lyons Colantha" and out of high-class Record of Merit and Record of Performance Dams.

East Riverside, Kings Co., N. B.

One Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only 1 cent a word, you can advertise anything you wish to buy, sell or exchange. The aderess must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issle. No black faced type or display of any kind will be allowed under this head, thus making a small add as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, Sussex, N. B.

FOR SALE:—500 Bushels Banner Oats, Improved seed. FISKE BROS., Florenceville, N. B.

FOR SALE—Pure Bred White Wyondotte Eggs for hatching. $1.00 per 15 F.O.B. train or boat—GEORGE SMITH, Youngs Cove, N B

FOR SALE.—Four young heavy horses.—ROBERT J. STEWART, Cole's Island, Queens Co., N. B.

WHITE WYANDOTTES—Bred to lay and win. Eggs, $5 00, $3.00 and $2.00 per 13, according to quality.—CLARENCE FAWCETT, Sussex, N. B.

FOR SALE—Pure bred Buff Orpington and White Plymouth Rock Eggs, $1.25 per 15.—ELWIN U. HARRISON, Maccan Station, N. S.

FOR SALE—A pure bred Clydesdale Stallion, rising two years, from best of imported stock. Apply to FRED E. SHARP, R. R. No. 1, Norton, N. B.

FOR SALE.—Five trios of Regal White Wyandottes, (Cockerel and Pullets), $5.00 per trio. Eggs for setting $2.00 per 15.—L.V. MATTHEWS, St. Mary's Ferry, N. B.

FOR SALE:—Pure bred white Orppingtons & Buff Cochen eggs for Hatching write for prices. F. V. BISHOP, Kilburn N. B.

VALLEY FARM HOLSTEIN OFFERING—One pure bred bull, 13 months old, from good producing stock.—W. G. CAMPBELL, Salisbury, N. B.

BLACK ORPINGTONS.—One pen only, made up of high class stock, mostly prize winners. Eggs $2.00 per 15.—T. J. LOVEGROVE, St. George, Ont.

REGISTERED GREEN MOUNTAIN POTATO SEED (C. S. G. A.), 98% in Dominion field and bin inspections. $1.50 per bushel, bags extra.—LENNOX NAPIER, Lower Woodstock, N. B.

BUFF COCHIN BANTAMS.—Winners at C. N. E., 1915, 1st pullet, 3rd cockerel, 4th hen; Stratford, 1st cock, 1st hen, 1st pullet; Listowel, 1st cock, hen and pullet. Eggs $2.00 per setting.—T. J. LOVEGROVE, St. George, Ont.

BOYS AND GIRLS—Look I will pay you forty per cent for selling Easter Cards Write for particulars, Address EMERY H. SMITH Nauwigewauk, N. B.

PORTRAIT AGENTS WANTED.—Send for catalogue, solar and bromide prints, portraits flat and convex, frames and war pictures.—MERCHANTS' PORTRAIT CO., Toronto.

WANTED.—Ladies to do plain and light sewing at home, whole or spare time; good pay; work sent any distance; charges paid. Send stamp for particulars. NATIONAL MANUFACTURING COMPANY, Montreal.

SENATOR DUNLAP STRAWBERRY PLANTS:—Booking orders now for this variety which has given general satisfaction in almost all sections and all kinds of soil, prices on application. RUFUS S. NEWCOMBE, Brooklyn Corner N. S.

REGISTERED CHESTER WHITE PIGS for April and May delivery. Pairs furnished not akin. Breeding stock bred by the best breeders in Canada.—W. S. COGSWELL, East Centreville, N. B.

BLACK LEGHORNS—One pen only, including 1st hen, 1st cockerel, 1st pullet, Galt; 1st hen, 1st and 2nd pullet, 3rd cockerel, Brantford; 1st hen, 1st pullet, Stratford; 1st hen, 1st pullet, 1st cockerel, Listowel. Eggs $2 00 per setting.—T. J. LOVEGROVE, St. George, Ont.

FOR SALE.—Bronze Turkey Eggs from large hens, headed by 40 lb. gobbler, $4.00 dozen; B.P. Rock Eggs, $1.50 for 13; W. Leghorn Eggs, $1.50 for 13; White Wyandotte Eggs, $2 00 for 13; Guinea Eggs, (Pearl) $1.00 for 9. Belgian Hares and Flemish Giant Rabbits, $1.00 each and upwards. No orders filled parcel post.—HOTEL DIEU FARM, Chatham, N. B.

GET YOUR NEW SUIT:—From Catesbys, London, England, for half what you pay local tailor. Best materials, style, fit guaranteed, or money back. Write for free Catalogue, self measurement form and patterns. Address CATESBYS LIMITED, CANADIAN OFFICE, 191 WELLINGTON ST. WEST. TORONTO. MENTION—Maritime Farmer.

SMALL ORCHARD FOR SALE:—On Avon River, Hantsport, Nova Scotia. Seven Acres with 60 apple trees, plums, cherries, pears, currants, raspberries, gooseberries, etc. Good house four rooms down stairs, four up stairs. Hot and cold water in house. Electric lights could easily be installed. Excellent summer bathing. Splendid opportunity for market gardner. Only ten minutes to churches and station. Owner's reason for selling, ill health. For further particulars, apply to W. H. SWEET Hantsport, N. S. 2917.

R. O.M. and R. O. P. Holsteins

Would you like to get a good foundation? Holsteins of this calibre are seldom offered at any price, but we are overstocked and will offer

2 Daughters of "Ruby Nig" whose 7 day record is 567 lbs. milk, 25.60 lbs. butter; yearly record, 16,555 lbs. milk, 750 lbs. butter; the second highest record in Canada at 3 years of age.

2 Daughters of "Black Rose Beauty" whose record is 522 lbs. milk, 24.60 lbs butter in 7 days.

2 Daughters of Miss Rooker Posch, whose record is 402 lbs. milk, 16 114 lbs. butter in 7 days; 12,268 lbs. milk, 600 lbs. butter in one year, when 3 years old.

2 Daughters of Beauty Rooker, whose record at 2 years of age is 322 lbs. milk, 15½ lbs. butter in 7 days; 11,248 lbs. milk, 517 lbs. butter in one year.

And several others of equal breeding, sired by or bred to "Ida Rooker 2nds Vale," a sperior animal in every way and a proven producer of rich milkers. Also some extra nice bulls of the above breeding, all at reasonable prices.

LEA & CLARK, Victoria, P. E. I.

ELMHURST SHORTHORN STOCK FARM

Present Offerings—Six exceptionally good red and roan bulls, 10 to 18 months of age, from superior milking dams. Write me for prices and particulars before placing your orders elsewhere.

C. C. H. EATON, - - - - CANARD, N. S.

BULL'S CREEK FARM

R. O. M. HOLSTEINS

Present Offering—Bull and Heifer Calves from high producing dams.
Prices reasonable for the quality.

J. H. STOCKTON, BULL'S CREEK FARM, —WCODSTOCK. N. B.

TURNIP SEED FOR SALE.—The Nova Scotia Agricultural College has two vatieties of turnip seed for sale—Corning's Lapland and Sutton's Champion—price 50c per pound, in quantities under 10 pounds, 40c per pound for orders over 10 pounds: Address NOVA SCOTIA AGRICULTURAL COLLEGE, Truro, N. S.

"ORCHARD HILL WHITE WYANDOTTES"—Martin's Regal, Beulah and Norfolk strains, some of the leading winning and laying strains in Canada. Selected females mated to "first prize utility cockerel" of Maritime Winter Fair, Amherst, 1915. Eggs $2.00 per 15; good utility matings, $1.25.—DEWITT SMITH, Amherst, R. R 4, N. S.

WANTED—PERSONS TO GROW MUSHROOMS for us at their own homes. From $15, per week upwards can be made by using small waste space in cellars, sheds, yards or gardens. We furnish full instructions. Illustrated booklet sent free on request. Address MONTREAL SUPPLY CO. Montreal Can.

Ever Stop to Think

Why the other fellow gets five cents more for his EGGS than you do?

He spends one cent and makes four. puts his egg up in dozen boxes, seals the package and puts the date on them. His name and date printed on the box is the guarantee of quality. That is why the consumer asks for his particular eggs.

Follow his example and write

for a sample. 1000 for $10.00; 500 for $6.00; 250 for $4.00 printed including seals.

BEE-KEEPERS SUPPLIES

Bee Hives, Sections, Weed Process Foundation. Instruction books and everything needed by bee-keepers. Northern Grown Nursery Stock. Lowest prices, Satisfaction guaranteed. Write for price lists.

E. L. Colpitts, Petitcodiac, N.B.

S. C. White Leghorns

Winners at Amherst, Halifax and Sydney. Eggs for hatching, utility $100 Exhibition $2.00 per 15. [Special pens prices on application.)

CHAS. JOHNSTON
Springfield Farm
Box 227 North Sydney N. S.

BUFF ORPINGTONS

I have changed my place of residence from Amherst to Oxford Jct. N. S. and am better prepared than ever, to supply those wishing Buff Orpingtons stock or eggs, the ideal table fowl and winter layers. Our winnings at the Maritime Winter Fair against strong Competion were as follows 1st cock 1st hen 1st cockerel 1st 3rd pullet, 2nd utility Cockerels 1st & 2nd utility pullets and 1st pen.

Our breeding pens are mated as follows

PEN NO. 1 Headed by "General Joffer" 1st cockerel at Halifax, F'ton, and Amherst mated with the 1st pen at the same shows, with 5 others of equal merit. Eggs $3.00 per 15

PEN NO. 2 Headed by "Kitchener" 1st Cock at Halifax, F'ton, and Amherst mated to the 1st 2nd Pullets with six others just as good. Eggs $2 00 per 15.

PEN NO 3 Headed by "Prince" never shown, but an exceptionly fine utility bird good eve, color right through with lots of size mated with the 1st & 2nd pairs of utility pullets at Amherst 1915 with others that will produce stock that will fill your egg basket next winter Eggs $1.50 per 15

All infertle eggs replaced free of charge

R. R. BLACK, "Elmhurst Farm,"
Oxford Junct., N.S.

FOR SALE

TURKEYS EGGS—$3.00 for 11. Butter cups $2.00 for 15. Blue Orpingtons, fine English stock $3.00 for 15. Blue Orpington Cockerl very choice bird $3.00

Fine Guernsey bull one year old, from a cow giving a pail of milk, well grown animal in fine condition $75

Strawberries.—Senator Dunlap, $3.50 per 1,000; other choice varieties, 85c per 100; mail postpaid.

Raspberries.—"Herbert," the only reliable, 75c per doz, mail postpaid; $2.00 per 100, $15.00 per 1,000.

Gooseberries.—"Pearl," 15c each.

EGGS FOR HATCHING.

Barred Plymouth Rocks, White Wyandottes and S. C. White Leghorns. Price $1.00 per 15.

Send for circular.

ORCHARD HILL FARM,
Brown's Flats, N.B.

How to Classify Fowls

Although there are several very excellent methods of classifying the many races of domestic poultry, there is none so good as by means of economic characteristics. It may surprise some to know that there are over a hundred distinct breeds of poultry, and upwards of three hundred varieties. Many of these are of no value to the utility poultry-keeper, since they are merely ornamental and possess neither laying nor table properties. Sometimes fowls are classed according to country of origin, and dividing the breeds thus we have the principal classes—the Asiatic and the Mediterranean.

The Asiatic is a large heavy bird, possessing good edible qualities; the hens, as a rule, are poor layers, but reliable sitters. The Mediterranean on the other hand, as a small-bodied fowl, carrying a single comb; the hens are splendid layers but poor sitters, while the flesh qualities are unsatisfactory. Another method of classifying is by means of color of plumage, in which case we have white birds, black birds, buff birds, etc., but since this serves no useful purpose to the utilitarian it is not worth while discussing it. Then, again, fowls are sometimes classified according to the presence or absence of leg feathering, to the shape of the comb, to the possession of the fifth toe, and in many other ways, none of which, however, are of any practical value.

The best, and only really satisfactory method of classifying fowls is by means of their economic qualities, since this denotes at once for what purpose a breed is most suitable. Dividing the varieties in this manner, we have four great classes, namely: (1) The table, (2) the non-sitting or laying, (3) the general purpose, (4) the fancy. To the fancy belongs by far the greater number of breeds, including, as it does, all the varieties of Bantam and Game fowls. Fancy fowls are those that are bred or selected for their outward characteristics only—their plumage, shape, comb, wattles, and general appearance. Provided that these points are correct, the number of eggs the hens lay, or the quality and flavor of their flesh, is of small importance. The fancy is a great and very valuable class, and there is not the least doubt but that had it not been for the fancy breeds of poultry, the industry, as a whole, would not be in anything like its flourishing condition.

Running Water—Hot and Cold—in Every Farm House

Ever think of keeping the boys on the farm by introducing city comforts into the farm house? The city is no place for boys or girls, but the drudgery of the farm drives them there. Eternally pumping, and never having a bit of hot water for shaving, washing, or bathing, without resorting to the tea-kettle, which is most often empty and the fire low, doesn't make a home a "sweet, sweet home." With a good water system, with gravity tank in the attic or pressure tank in cellar, there is a constant supply of water in the boiler attached to the kitchen stove or heating jack, so that you can get hot water any time of the day or night—upstairs, downstairs, in bath room, bed room, or kitchen. When you visit the city and realize the convenience of a hot and cold water system in the house, remember you can have the same, and at slight expense, right in your own home on the farm.

Would You Like to Know What it Costs?

If you think it costs much, you're wrong. At least, if you purchase an Ontario Wind Engine and Pump Company equipment, you will find it gives endless satisfaction, faultless service, and COSTS NO MORE THAN YOU CAN EASILY AFFORD. Do you consider a Binder a good investment? Yet you use it only two weeks in the year. Compare that with the usefulness of a constant supply of RUNNING WATER in the House and Barn, all the year round, at practically the same cost. Consider the comfort of every member of your family—hot baths in winter, cool baths in summer, drinking and cooking water and washing water—*just by turning a tap.* The *cost* of *operating* a water system is about the same as the *cost* of Binder *Twine* for the Binder. Compare them—you see at once the Water System is a *Better* Investment than the *Binder.* You *can't* advantageously do *without* either.

Our Water System is operated by Gasoline Engine, Windmill, or electric motor. We supply engines that give ample power for all farm work powerfully constructed, latest approved types and improvements, and at prices that demonstrate our determination to please.

Potato Growing and the Maintenance of Soil Fertility

By W. W. Hubbard, Superintendent, Dominion Experimental Station, Fredericton, N. B.

What is a fertile soil?

A soil in which an adequate supply of plant food is so surrounded by chemical, bacteriological and mechanical or physical conditions that our crops through their root system will flourish.

What is an infertile soil?

You say a soil too poor to grow crops and you wish to convey the impression that there is so little plant food in the soil that practically all the plant requires, has to be applied. There may be soils without plant food in them somewhere in this province, but I do not know where they are.

No, an infertile soil is not necessary a soil barren of plant food, for some of our richest soils will not grow crops, and I very much doubt if anyone here can show me an area which when all the chemical and physical conditions are made right, will not produce crops even without the addition of any plant food.

A soil to be chemically right must not be very acid nor very alkaline, and to be physically right must be fairly divided into particles, have an abundance of humus or organic matter in a decaying state and with sufficient, but no great excess of moisture and also be open enough that the air may readily circulate through it, then the climate must warm it to 43 degrees or above. When these conditions are right, the soil becomes a great storhouse of bacterial life and through the influence of these minute organisms all sorts of changes take place in the composition of the soil, and soluble plant food becomes available.

It must always be borne in mind that plants have to drink all their food and that it is only when fertilizing material becomes dissolved that it becomes of use. All fertilizing elements are not soluable in water, and it is only through chemical or bacterial action that they become available. This fact explains why sometimes fertilizers fail to give noticeable results during the year in which they are applied. Take Basic Slag for instance; this material is not soluble in water at all and it is only when it comes in contact with an acid solution that it gives up its phosphoric acid.

As above stated, a soil cannot be right for plant growth unless it contains a fair proportion of organic matter, i.e., vegetable substances in process of decay, called humus.

In a state of nature, soils which are producing hardwood forests and grasses are yearly adding to their humus by the falling of the leaves from the trees and the dying down of the grasses. In softwood forests there is much less humus formed and this explains the great difference in natural available fertility between hardwood land and that cleared from a growth of evergreen and resinous trees. This illustration very forcibly presents itself to us the great value of humus. Allow me in the words of the Dominion Chemist to impress upon you the great agricultural importance of this vegetable matter termed "Humus."

1st.—"It is the natural storehouse and conservator of nitrogen, which element is the most expensive of all plant foods when it becomes necessary to purchase it in commercial fertilizers."

2nd.—"It furnishes the food upon which the soil micro-organisms live, and which by their like functions convert its organic nitrogen into nitrates."

3rd.—"It possesses considerable amounts of the mineral food constituents. These, in the further decomposition of the humus—a process continually going or in the summer, are liberated in forms available to growing crops. We have reason to believe from recent research, that the mineral humates furnish a large proportion of the potash, lime, etc., used by crops."

4th.—"It serves to increase the absorptive and retentive power of soils for moisture."

5th.—"It regulates and protects against extremes of soil temperature."

6th.—"It opens up and mellows heavy soils."

7th.—"It serves to materially diminish the loss of fertilizing elements by drainage, thus permanently improving in the best way, light soils."

In this province many of our so-called run out and sometimes abandoned farms are simply lacking in humus. By an exhaustive system of farming the humus was not replaced as it was taken out and soil conditions became impossible for plant growth, though in all probability there are large stores of plant food in those soils awaiting only the addition of humus, which can be added in several ways. On very run out soils, some barn-yard manure will probably be required to introduce bacterial life to assist in providing soluable plant food. Perhaps five (5) tons to the acre will be enough to give buckwheat a start. If no manure is available then buckwheat may be started by a light application of fertilizer after it has got its growth. Plough in this buckwheat. If it was a pretty scanty crop, grow buckwheat the next year and sow clover or red clover, or both. It will be desirable to treat the clover with nitro culture, 25 cents worth of which will treat a bushel of seed. The soil should now be in a condition to grow peas; treat the seed peas with nitro culture and plough them in, say in August, then sow winter rye and clover. Use gypsum, ashes and basic slag, or lime if it can be got, in place of gypsum. The rye will make some fall growth and help protect the clover. It will come on in the spring and should enable the cutting of a crop of hay. The second growth of clover can then be turned under and there should result a soil which can be treated in the ordinary way. It will be seady, with ten loads of manure or a half-ton of fertilizer to the acre to give a good crop of potatoes, grow a grain crop the following year, seeded down to clover for a crop of hay and to further enrich the soil.

This much for the man who states his land is so poor that he cannot grow anything on it. Probably its only poverty is its lack of humus and nitrogen, for by no possibility could the other elements be all cropped out in this young country. A way has been indicated as to how this land may be at least partially supplied with humus, without which commercial fertilizers or large applications of bary-yard manure are more or less wasted, though if an adequate supply of bary-yard manure is available, the land could be much more quickly brought in than has been indicated.

As to the inorganic elements of fertility in the soil, we can learn something from the work of the Experimental Farms, through Dr. Shutt, Dominion Chemist. From his researches he estimates that average Canadian soils contain from 3,500 lbs. to 6,000 lbs. Phosphoric Acid, and from 5,500 lbs. to 11,000 lbs. Potash per acre in the first eight inches of the surface.

Sandy and gravelly soils contain less of these elements than heavier soils, while heavy clay soils contain **relatively more Potash than Phosphoric Acid.** All this supply is not immediately available to the growing crops however. Of Potash it has been determined that only .23 of 1 per cent is available, and of Phosphoric Acid 5.66 per cent in the upper six inches of the soil. This would mean then that of the Phosphoric Acid, there would be from 198 lbs. to 339.6 lbs. per acre available in any one year. Of the Potash, there would be from 126.5 to 253 lbs. per acre available in any one season.

The reserve supplies become available year after year through the disintegration of the soil, due to cultivation and the chemical action of other materials, such as lime, or by the solvent action of gases and solutions formed, either chemically or bacteriologically.

In the time at our disposal it is not possible to discuss all the combinations of rotations of crops and means that might be taken to maintain fertility, but it will probably be most useful to discuss the plan now quite general, of using a three year rotation of potatoes, oats and clover in connection with making a specialty of the potato crop.

If we will just consider waht demands these three crops make on the soil, we will know best how to meet them.

We will again consult the Dominion Chemist. He gives us the following figures as to the quantity of fertilizing materials taken from the soil per acre.

	Nitrogen.	Phosphoric Acid.	Potash.
Potatoes, 100 barrels per acre	73	37	137
Oats, 50 bushels per acre	35	12	10
Oat Straw, 3,000 lbs. per acre	15	6	35
Clover Hay, 2 tons per acre	—	28	66
	123	83	248

There should be already available in soil of mderate fertility with good cultivation, at least 198 lbs. Phosphoric Acid and 126.5 lbs. Potash; more than enough Phosphoric Acid and about half enough Potash, and if the humus supply is adequate, plenty of Nitrogen. We find, however, in actual practise that an excess is required as plants do not reach all soil particles and there is also more or less wastage of fertility by darinage, chemical and bacterial action.

We therefore, to maintain the crop producing power of the land, should aim to add at least as much as is taken out. How shall we do it? We can do it undoubtedly most economically by feeding live stock, saving all the manure and applying this to the land. How much manure will be required?

Average barn-yard manure unleached will contain 10 lbs. Nitrogen, 6 2-3 lbs. Phosphoric Acid and 10 lbs Potash: 13 tons to the acre would give us:

	Amount required.
130 lbs. Nitrogen	123
86 lbs. Phosphoric Acid	83
130 lbs. Potash	248

This would seem to indicate that more Potash than that contained in 13 tons of manure would be required, and if Potash were cheap and we could buy it it might be and has been desirable to use some in addition to what we get naturally but, in these times it

(Continued on Page 508.)

SPRAYING AT DIFFERENT DATES

In order to gather further information as to the value of the early sprays as compared with the later ones a series of tests in which plots were sprayed twice before, and twice after the blossoms, were compared with these sprayed once before the blossoms and twice after.

In one series of experiments the one spray before the blossoms was put on about midway between the first spray put on just after the leaf buds were nicely opened May 17th, and the second spray put on just before the first petals opened May 31st or just before or about the time theblossom clusters were showing pink, this we have called a midway spray.

In the other test the one spray before blossoms was put on just before the petals of the flower clusters opened.

It will be noticed from the summary of the lime sulphur Arsenate plots below that there was a difference of from 2 to 3 per cent. only in favor of two sprays before the blossoms and that the two most important sprays were the ones just before and just after blossoming. From results obtained it would seem that should the period between the opening of the leaf buds and the opening of the petals of the flower clusters be short owing to weather conditions one spray may be sufficient to give practically clean fruit, but should this period be extended two sprays should be given.

A study of results from the soluble sulphur plots sprayed at different dates as shown by the summary indicates that the early spray was quite an important one and that two applications before the blossoms were advisable. It is interesting to note also that on the day following the application of the midway spray at Berwick there was a sharp rainfall of about ¼ inch as was the case with the spray after blosoming which would show that soluble sulphur is not an adhesive spray and that a heavy quick rainfall may reduce its fungicidal value and bring about increased burning also as was the case iwth these sprays.

It would seem therefore that from our present knowledge it is wise make two applications before blossoms; first after the leaf buds open, and second just before the blossoms open which dates correspond with those advised for the best control of insects.

SPRAYS APPLIED AT DIFFERENT DATES.

SUMMARY.

Lime Sulphur 1.008 specific gravity or one gallon concentrate to make 37 gallons spray and 5 lbs. Arsenate of Lead to 100 gallons.

16 experiments—Two before and two after blossoms, 8.33 percent scab.

Experiment 9—One midway between first and second and two after blossoms, 11.48 percent. scab.

9 experiments—One just before and two after blossoms, 10.33 percent. scab.

1 experiment.—Two after blossoms only, 31.30 percent scab.

1 experiment—One two weeks after blossoms, 88.70 percent scab.

14 experiment—No spray, 68.6 percent scab.

Soluble Sulphur 1½ lbs. and 5 lbs. Arsenate t 100 Galoins.

8 experiments—Two before and two after blosoms, 16.8 percent scab.

5 experiments—One midway between first and second and two after blossoms, 37.6 percent scab.

4 experiments.—One just before and two after blossoms, 34.2 percent scab.

4 experiment—No spray, 65.1 percent scab.

SOLUBLE vs. LIME SULPHUR

A number of tests have been made wth soluble sulphur arsenate of different strengths to compare with lime sulphur arsenate for apple scab control and the results as given in the summary would go to show that the scab control was slightly better at Falmouth with lime-sulphur arsenate than with soluble sulphur arsenate, at Berwick the control was decidedly better with lime sulphur arsenate and at Bridgetown the soluble sulphur arsenate gave the best control. As already pointed out the first spray after blossoming at Berwick was followed the next day with a sharp rain which may have washed off some of the spray resulting in the large percentage of scab shown.

Arsenate of lead at the rate of 5 pounds per 100 gallons was used in each spray. Two sprays were given before and two after blossoming.

..SOLUBLE vs. LIME SULPHUR..

SUMMARY.

FALMOUTH.

3 experiments—Soluble sulphur 1½ lbs. to 100 gals. p.c. scab 5.1.

3 experiments—Soluble sulphur 2 lbs. to 100 gals., p. c. scab, 3.6

3 experiments—Soluble sulphur 2½ lbs to 100 gals., p.c. scab, 3.3.

2 expriments—Lime sulphur 1.008 specific gravity, p. c. scab, 1.84.

BERWICK.

1 experiment—Soluble sulphur 1½ lbs to 100 gals. p.c. scab, 42.00.

1 experiment—Soluble sulphur 2½ lbs. to 100 gals., p.c. scab 36.70.

1 experiment—Lime sulphur 1.008 specific gravity, p.c. scab 10.10.

BRIDGETOWN

5 experiments—Soluble sulphur, 1½ lbs. to 100 gals., p.c. scab 10.3.

5 experiments..Lime sulphur, 1.008 specific gravity, p. c. scab 12.52.

DIFFERENT QUANTITIES OF SOLUBLE SULPHUR

In order to find out whether a strength of soluble sulphur greater than that advised, which is 1½ lbs. to 100 gallons, will give a better control of scab, or increase the foliage injury, a series of tests were made at Berwick on Gravenstein, and at Falmouth on Gravenstein, Spy and Golden Russet. Five pounds of arsenate of lead was used per 100 gallons in each spray. The sprays were applied at the same date under uniform conditions.

It will be noticed that the fungic-

idal value of the spray was not materially increased by a strength greater than that recommended and that the stronger sprays are likely to cause increased foliage injury.

Spray used at Berwick on Gravenstein

Soluble sulphur 1½ lbs, Barium Chloride ½ lb. to 100 gals., p.c. scab 47.6, p.c. foliage injury 12.

Soluble sulphur 2 lbs., Barium Chloride ½ lb. to 100 gals. p.c. scab 84.2, p.c. foliage injury 66.

Soluble sulphur 2½ lbs. Barium Chloride ½ lb. to 100 gals., p.c. scab, 42.2, p.c. foliage injury, 64.

Soluble sulphur 3 lbs. of Barium Chloride, ½ lb. to 100 gals., p.c. scab 49.2; p.c. foliage injury, 65.

No spray, p.c. scab 73.4; p. c. foliage injury, 0.

Spray used at Falmouth on Graven.

Gravenstein—Soluble sulphur 1½ lbs. to 100 gals., p.c. scab, 6.4.

Spy—Soluble sulphur 1½ lbs. to-100 gals. p.c. scab, 0.0

Golden Russet, soluble sulphur, 1½ lbs. to 100 gals., p.c. scab 8.9.

Average of three varieties—p.c. scab, 5.1.

Gravenstein soluble sulphur 2 lbs. to 100 gals., p.c. scab, 4.7.

Spy—Soluble sulphur, 2 lbs. to 100 gals., p.c. scab, 2.2.

Golden Russet—Soluble sulphur, 2 lbs. to 100 gals., p.c. scab, 4.0.

Average of three varieties—p.c. scab 3.6.

Spray used at Falmouth.

Gravenstein—Soluble sulphur, 2½ lbs. to 100 gals., p. c. scab, 6.3.

Spy—Soluble sulphur, 2½ lbs. to 100 gals. p. c. scab, 2.1.

Golden Russet—Soluble sulphur, 2½ lbs. to 100 gals, p. c. scab, 4.5.

Average . of three varieties—p.c scab, 4.3.

Gravenstein—No spray, p.c. scab, 43.2.

Spy—No spray, p.c. scab, 51.4.

Golden Russet—No spray, p.c. scab, 34.2.

Average of three varieties—P. c. scab, 42.9.

Gravenstein—Soluble sulphur 1½ lbs. BaCL2, ½ lb. to 100 gals, p.c. of scab, 8.9.

Spy—Soluble ulphur, 1½ l bs. BaCL2 ½ lb. to 100 gals, p.c. scab 4.2.

Golden Russet—Soluble sulphur 1½ lbs. BaCL2, ½ lb. to 100 gals, p. c. of scab, 7.8

Average of three varieties—p. c. of scab, 6.9 .

Gravenstein—Soluble sulphur 2 lbs. BaCL2, ½ lb. to 100 gals, p. c. scab, 4.7.

Spy—Soluble sulphur, 2 lbs. BaCL2 ½ lb. to 100 gals, p.c. scab, 4.2.

Golden Russet—Soluble sulphur 2 lbs BaCL2 ½ lb. to 100 gals, p. c. of scab, 9.2.

Average of three varieties—p.c. of scab, 6.0.

Gravenstein—Soluble sulphur, 2½ lbs. BaCL2 ½ lb. to 100 gals., p. c. of scab, 9.2.

Spy—Soluble sulphur, 2½ lbs, BaCL2 ½ lb. to 100 gals, p.c. scab,, 4.5.

Golden Russet—Soluble sulphur, 2½ lbs, BaCL2 ½ lb. to 100 gals., p.c. of scab, 12.8.

Average of three varieties—p. c. of Scab, 8.8.—Experiments conducted at Kentville, by Prof. W. S. Blair.

Seeding of Clover

Out of twenty-three farmers in the Eastern Provinces who have conducted illustration work for the Commission of Conservation, only two claim to have been sowing their clover seed thick enough to ensure a good catch. Twenty-one had been sowing an average amount of six pounds to the acre, whereas they now sow 10 pounds to the acre. Some had sown as low as three or four pounds but are now convinced that 10 pound is better and are sowing it. Three farmers had previously grown their own seed while now twelve are regularly doing it.

George R. Barrie, Galt, Ont., says: "The high price of clover seed had something to do with our sowing a small amount, but since growing our own seed, we do not mind sowing it heavier and find that the extra seeding more than pays for itself."

in 1914 they produced 500 pounds of ously grown his own seed states that i n1914 they produced 500 pounds of alsike seed and 100 pounds of red clover while in 1915 he grew over 1,000 pounds of red clover seed. The farmer doing illustration work for the Commission in Lanark County, Ont., in 1914, grew 1,200 pounds of red clover seed and had never grown a pound of his own seed previons to commencing work with the Commission.

"Velvet" For Dairymen

West Chester, Pa.

Mr. Dairyman: *February 3rd, 1916.*

We have a wonderful new invention and I want to tell you about it myself. It is a source of new profit for dairymen without added expense which I call "velvet," for it is *all profit.*

Thirty-five years, longest in America, the Sharples plant has been devoted exclusively to the Cream Separator.

Its inventors produced the first cream over-flow bowl with its superior quality of smooth even cream, the first directly driven steam Separator, saving power, fuel and wear, the first and only tubular bowl with its doubled skimming force and efficiency and extreme simplicity, the bottom feed, the hanging tubular bowl, all making for convenience, durability, economy of maintenance and operation.

Now we have made another great invention, greatest of all as a profit producer, though so simple that it seems we should have had it long ago.

Thousands of carefully made observations by competent investigators, government officials and scientific men have proven beyond question that 95% of all the hand driven cream separators in America are turned below regulation speed, below the speed marked on the handle, a great part of the time and *every* hand separator is under-speeded *some* of the time.

No matter which separator, whose make, or what it is capable of doing when turned at full speed, it will lose cream and a lot of it, when the speed is allowed to drop even for a moment, and with the cream goes the profit.

THE NEW

SHARPLES

SUCTION FEED

Separator will stop this loss, aggregating millions of dollars annually to America's dairymen—stop it at once and forever.

No matter if you turn this Separator at widely varying speeds, fast or slow, it skims equally clean—no cream will be lost. The bowl *drinks its milk supply as it needs it,* always in exact proportion to the separating force within the bowl. At slower speeds it drinks less, at faster speeds more, but always just the right amount for *clean* skimming.

A thousand of these machines are in regular daily use; we demonstrated them to a finish before nnouncing them; it is the Sharples way—*absolute perfection before sale.*

The Sharples Suction Feed Separator has several very important advantages in addition to its certainty of clean skimming at any speed. The varying of speed does not change the thickness of cream; fast turning increases the capacity much above normal, just as you whip up a horse, when in a hurry. The supply can is but knee high and the machine throughout is simpler and better than ever.

We sell our Separators now, as always, subject to free trial by the buyer; but a stronger guarantee than any trial is the unbroken record of the growth of this business from the small beginning of 35 years ago to its immense proportions of to-day. It could not grow so except by the unbroken rule of complete satisfaction to customers.

Lack of space prevents explaining more fully; but send today for new book, "Velvet for Dairymen," that tells all about this money-saving invention.

Sincerely yours,

P. M. Sharples

President.

DRY CLEAN WHERE YOU ARE

Statistics show that for every dollar spent for education, America spends $6.00 for alcholoic drinks. Of the two, which in your estimation is the most beneficial to the individual and to the nation? Can you not recall some young man of your acquaintance who began life with every prospect for a successful career who eventually made a dismal failure of his life and his business, yea, wrecked his home and brought dishonor and shame to his nearest and dearest friends just because he allowed himself to drift into too close an intimacy with King Alcohol? We have seen many such young men ,older men too. We are sorry to state that men and boys are not the only victims — not infrequently the police court records contain the names of members of the female sex who have listened to King Alcohol's woeing to their shame and sorrow, and who are a bane to their friends, homes and their town. Have you ever seen the wan faces of wives, mothers and children-wan for want of the very necessaries of life while the bread winner's money is spent in the degredation of himself and family, and the rumseller and his family are waxing fat on the money that should have gone to feed and clothe the precious young tots that are forced to suffer the privations of a drunkard's children. These young children have a hard battle to fight in order to get along in after life—heredity and perchance environment is against them. Of the two, in our opinion heredity is the harder to fight, but a combination of the two is worse. The tendency of the majority of these children is not towards the best citizenship, although we frequently find cases where a child has risen above his environment. Cases of this kind are, however, few and far between. Did your heart ever go out in sympathy to ill-fed and badly clothed little children? Did you ever imagine your own loved ones in similar straits? It makes no difference what a child's heredity, environment or poverty is there are great possibilities locked up in its little body—possibilities that may become realities if given half a chance.

Despite Russia's powerful example in the abolition of their national beverage, Vodka, and France's ban on Absinthe, we occasionallyq hear men of supposed standing in their respective communities, some of them holding responsible government positions and expected to be leaders for progress, expressing their views strongly against the movement for temperance reform and in depreciation of the prohibition question. Such a system of teaching coming from men who should know better is simply damnable, and the sooner their services are dispensed with by the people, for they are the peoples' servants, the better for the people and for the country at large.

Even sound doctrine coming from leaders who go on record against the cause of prohibition will not be followed and will consequently fail to accomplish the desired ends.

If these men had to furnish the boys to fill the saloons they would right soon change their views and join the ranks of right angainst the wrong, and would strive to brighten the corner where they live.

The handwriting is on the wall. The provinces of Canada are one by one going ahead against intemperance.

The opportunity will be given ere long to "Dry Clean New Brunswick." Let each and every one who would like to help brighten saddened homes work with courage to enlist other workers in the fight. It is your fight as well as that of the other fellow's. Don't be apathetic. What your action will be will either help or mar. Dry Clean where you are. Don't be misled by what bloated faced, leary eyed individuals with a breath savoring strongly of a visit to a bar room says. Their stocks in the estimation of the right thinking public has fallen off 100% and they know it. Treat them as you would a case of Smallpox, their teaching is both rotten and dangerous, and the sooner they are relieved of their responsible leadership opportunities the better for the rising gneration and all posterity. — Dry Clean where you are.

WHY SAVE ?

A banker gives this practical illustration of systematic saving:

"I have in mind a young man about twenty "years of age working as a slate maker in one "of our quarries, who is one of our regular de-"positors in the savings department. During "a period of four years, just passed, he has de-"posited each month an average of twenty-"five dollars, a total of $1,200 for the period, "or $300 per year. This is a good yearly sav-"ing, considering the average of steady work "for him is nine months out of the year.

"Periodically this young man withdraws $500 "and invests in good bonds yielding a fair in-"terest. Since the inauguration of his saving "habit, about four years ago, he has accumu-"lated $1,500 in such securities, and if he main-"tains his average savings for several years to "come he will undoubtedly have the nucleus "of a small fortune and be in a position to es-"tablish himself comfortably in the world..

"Such an example of thrift is worth follow-"ing and is unquestionably the surest way to "become independent."

The above statement brings out in a very emphatic manner one of the necessary elements of the saving habit—that is, it is necessary to have a system and to follow that system very energetically. Employers are more and more becoming convinced that the saving habit should become just as much a part of the program of the wage earner as efficiency is a part of the program of every progressive business man.

It is just as true that you cannot be a successful saver if you do not follow a well defined and well directed program as it is that you cannot be successful in your line of work if you work at your trade or profession spasmodically.

This nation will never be known as a nation of savers unless individuals subscribe to a constructive saving program. A nation's ideals along any line can be no higher than the ideals of its individual citizens. Years ago when the mutual savings banks in the eastern part of our country were established they were operated along illtruistic lines and personal interests were sacrificed for the general good. This is coming more and more to be the case in the efforts that are being put forth by employers of labor and others interested in the savings propaganda.

Through the agency of the potal savings system the government has been able to prove itself a great civilizing power in bringing to the foreigner protection for his savings. If the government is able to accomplish these things it should make individuals, private and corporate, in every industry more desirous of doing their part in this great movement of teaching saving and econonly and provide suitable means of investing these savings to the best advantage. We believe every individual should join the crusade against waste and improvidence because it has become an important factor in the progress and development of modern industry and because there is no one thing he can do that will bring him more personal welfare and happiness.

GOT A TASK THAT ANNOYS YOU?

There is something very trying in a task. It has an unpleasant way of asserting itself at the busiest and most inopportune moments. It thrusts itself forward to blight our unpleasantest hours, and comes into our lives like an avenging power. It is never welcome, always provokes, and is ever a burden to accomplish.

There are two ways by which it can be annihilated. One is by arraying ourselves in our armor, so to speak, as they picture the Christians of old, and going out to conquer as they fought sin. The other is to woo it, as a girl a refractory lover, studying its possibilities until a real interest asserts itself and it changes its nature, ceasing to be a task, and becoming a pleasure.

WEAKNESS OF RURAL SCHOOLS

The weakness of the common schools in rural communities shows itself in their failure to educate the marginal people of the community; in their failure to train average men and women for life in that community; in their robbing the community of leaderships by training those on whom their influence is strongest, so that they go out from the community never to return; and in their general disloyalty to the local community with its needs and problems.

Preparedness is a newly coined word, yet preparedness means little more than watching the leaks. Stop up the little leaks, and there will be no big ones. Where there are no leaks—no unnecessary losses—there is a profit, and where there is a profit, there can be no failure.

Value of the Workshop on the Farm

I wonder how much the average farmer pays out every year for repair work? A large amount, indeed. And still nearly all of this may be saved by the outlay of a little expense at first. When we go to town to have some repair work done, or to get a horse shod, we not only pay the blacksmith's price, but we lose our own time while he is doing the work, and we lose the time while we are going and coming from the shop, as well. Is our time worth anything? If it is, then why should we use it so wastefully?

With a good workshop and a set of tools, we might save much of this time and expense, and after a little practice we should be able to do the work nearly as good as the mechanic. It would answer our purpose, at least.

Many a time we sit around the fire on a stormy day, when if we had a shop, we might replace some broken whiffletree, or mend some chains, or make many other needed repairs too numerous too mention. While doing this, our minds would be taken from our other work and it would be much better for our health than to be doing nothing.

Perhaps we should not try to shoe our horses or do other particular work at first, but if we are diligent, as every successful farmer is, we can soon learn to do such work fairly satisfactory.

When we have a few leisure hours, it would be time well invested if we made duplicates of several parts of our machinery which are mostly likely to be broken. Then, when repairs are needed, we will save the time and trouble of making them at once.

If we had several loads of hay ready to go into the barn, and had the misfortune to break a whiffletree or neck yoke, what an annoyance it would cause us to leave the hay out in a shower while we were replacing the broken rigging. By the economical use of our spare time, we can be prepared to meet nearly evey emergency and save many such annoyances.

If we should become skilful with the use of tools, even our household furniture can be improved and many beautiful and useful pieces of our own handicraft added to their number.

Do not keep the tools away from the boys, but, if necessary, caution them against their rough usage. Nearly every boy enjoys making his own toys, and even though it may seem that he is idling away his time and wasting material, in reality he is but learning to be a skilful mechanic, and when repairs are needed, or new buildings are to be erected, he will be equal to the occasion. Not only should he be allowed freedom in the shop, but manual training should be taught in every high school.

People say this is an age of specialization. From this would be inferred that the farmer should work only on his farm and leave the repair work for those who specialize in that line. But where is there a factory that would think of getting along without its machine shop? If every time any repairs were needed they had to be taken to a local machine shop, that factory would have to ask such exorbitant prices for its goods that the public could not afford to buy them. The workshop is just as essential to the farm as the machine shop is to the factory. If we specialize in anything, let independence be our specialization. The worshop is one great aid to independence. By its use we can keep the farm buildings in better repair and bring the farm into a higher degree of efficiency; for only an efficient farm is the farm worth while today, and the greater the efficiency, the greater the prosperity and happiness of the farmer.

Then here's to the man who works in the mill,
Or earns his bread any other way,
But the man on the farm is the freest from harm
And is the healthist man today.

"Then glory to the wood that's carved on the farmer's bench,
And thanks to God for the iron rod to mond our implements."

Claude S. Cushman in Maine Farmer.

Manures

Manure is such a valuable by-product of the farm that the young stock and the milk may seem the by-product and the manure the product for which we are feeding the stock. When added to the soil, it tends to loosen up the clays and loams, making them more easily worked, more porus, more easily and quickly drained, better aerated, and, in general, a more desirable home for beneficial bacteria and the roots of plants. Manure also has a tendency to fluctuate the soil, holding the particles loosely together, forming the desirable crumb structure. Sands are bound together and, like other types of soil, their water holding capacity is very much increased. King of Wisconsin states that where soil has had an application of manure, the surface foot has been found to hold 18.75 tons more water per acre than where no manure was applied.

The fermentation of manure develops heat and warms the soil.

The addition of manure carries great numbers of desirable forms of bacteria to the soil, that go to work liberating the more insoluable nitrates and minerals of the soil for the use of growing plants.

The effects of manure may be seen for forty years after an application, but ordinarily is not noticed after three or four years.

Chemically, manures add to the soil those elements ordinarily purchased in commercial fertilizers, i.e., nitrogent, phosphorus and potassium. Mixed manure will carry about 10 pounds nitrogen, five pounds phosphoric acid and 10 pounds potash. This makes an unbalanced fertilizer and can be balanced by adding, say, about 1000 pounds of 16 per cent acid phosphates to eight tons of manure, which will give a product corresponding closely to a 4-10-4 fertilizer.

The chemical composition of the manure depends upon the kind and age of the animal, the character of the feed consumed by the animal, whether working, producing milk or bone and muscle. Horse manure is usually given a value of $2.65; cow, $3.10; hog, $3.25; sheep, $6.05; and poultry, $6.35.

The decay of manure in the soil develops organic acids that attack the more insoluable minerals, and liberates food for the use of growing plants. Humus formed by its decay holds these minerals from leaching away.

The vaule of a ton of manure is best measured by the increased crop it produces. The Pennsylvania station reports the following:

Number of tons applied per acre, 12; value of increase in crop, $19.75; 16 tons, $21.07; 20 tons, $22.73.

Value for each ton of manure at different applications: 12 ton — value of crop per ton of manure, $1.65; 16 tons, $1.32; 20 tons, $1.14.

Counting $1.65 for the value of the first 12 tons applied, the last eight tons only gave a value of 37c per ton. Then the principle would follow that it is more profitable to spread a small amount over a small area. The liquids are easily lost if not immediately used by a growing crop, and it is not advisable to apply more than the first crop can use of the liquid portions. The solid part may remain for future crops without so much loss.

The Common Scab

The common Scab of the potato is unsightly and while it does not cause the damage that is attributed to the Powdery Scab it depreciates the selling value of your potatoes. No one wishes to buy scabby potatoes. If you do not grow scabby potatoes you will have no scabby potatoes for sale. The scab of potatoes is a fungus growth which shows itself in a rough and cankerous appearance on the surface of the tubers. A great amount of work has been expended on this disease and still no preventive is known if the land is inoculated with the trouble.

Of a large number of methods used for treating the seed potatoes, soaking them in a solution of formalin, one pound to thirty gallons of water for two hours, is the most effective. Soak the potatoes before cutting them, and if they are not planted at once spread thinly to dry. This treatment will kill the disease on the seed, but scab can live in the soil for many years without a known host. Lime, wood ashes and barnyard manure aid the growth of scab, while sulphat of ammonia, muriate of potash, acid phosphate and dissolved lime render the soil less favorable to the disease. If you have never treated your seed potatoes for scab do so this year and watch results. You will be delighted with the smoothness of the tubers. If you have used the treatment once we know you will do so again.

Get Rid of Smut

Do you remember the number of black smutty heads that appeared in your grain fields last year? Did you ever stop to think of the percentage of your grain that is yearly damaged by smut? Did you ever stop to think of the great reduction smut thus makes in the income from your fields and labors? Did you ever stop to think that these losses could be avoided by a little extra inexpensive efforts on your part?

You ask how can I do it? Well, here you are; this is the way other readers of the Maritime Farmer handle the proposition, and why not you. Now is the time to do it before you sow your grain.

This is the time of year to ensure against smut in grain. There is no reason why smut losses should be the case if the seed is propertly treated.

The best known and most widely used substance for treating seed grain is formaldehyde. This can be bought in drug stores at a moderate price. One pint is put into forty gallons of water, and the seed grain is then dipped in the mixture in such a way as to wet the outside of every kernel. Or the formaldehyde solution may be sprayed onto the grain, while shovelled over frequently and then covered with old sacks.

A few precautions should always be observed.

(1) Formaldehyde varies in strength and, if there is doubt as to its quality, a sample of it should be sent to the chemist of the Experimental Farm, in order to determine its exact strength.

(2) The sacks in which the grain is treated should first be cleansed by boiling in water, or by washing in a strong solution of formaldehyde.

(3) Everything which the grain touches after having been treated, sacks, seeder, etc., should be very thoroughly cleaned with a strong solu tion of formaldhyde (1 pint to 10 gallons of water.)

(4) If the seed is kept for some time after treatment; allow for the swelling of the seed, if you sow the grain soon after treatment, by planting per acre.

The formaldehyde treatment will prevent stinking smut of wheat, covered smut of barley, and smut of oats. It also prevents flax will if the treated seed is sown on land which has grown on flax for five or six years.

Sheep Dipping

Do you dip your sheep? If not we dare say at shearing time you found your sheep infested with vermin. Did you ever watch a vermin infested flock of sheep and see how restless they are? How they rub themselves against fences, feed racks, etc? How they bite at their skin and pull the wool until in some cases the lambs almost denuded? How they suffer! Suffering, as they do, they cannot thrive, and spring finds them in an emaciated condition. The loss at lambing time is greater than it would be if the ewes were strong and giving a bountiful supply of milk. Why not dip your sheep this summer and thus give both ewes and lambs a chance to thrive? The process is quite simple. If you follow the following rules you cannot go wrong in this respect. See that the preparation is properly mixed and the correct quantity of water is added. Don't guess at it.

Never hurry the dipping, always take care that every sheep is kept in the bath more than two minutes.

Have the bath well and regularly stirred up from the bottom always before beginning to dip, and whenever any stpoage occurs.

1. The best time for dipping is from one to three months after shearing.

2. The sheep should not be over heated or thirsty at the time of dipping.

3. If the sun is very hot, it is better to have the draining pens under shade.

4. If the nights are cold the dipping should always be stopped soon enough to allow the sheep some time to dry before sunset.

Why Cut-Off Drains are Sometimes Failures

Many drains have been constructed by farmers with the idea of "cutting off" the seepage water before it enters their field, and in attempting to do this they have dug an open-drain ditch or constructed a tile drain just above the wet spot on their land. Sometimes a drain of this kind has been successful in every way and has done the work required, but many times a drain of this kind has been an absolute failure, and the seeped area hos not been relieved in any way. There are many reasons for these failures, for usually the farmer makes no investigation of the subsoil conditions before installing his drain.

The fact of the matter is, that in most cases our seeped areas are caused by a porous subsoil stratum "pinching off," later filling with water until the surface of the ground shows the effects of seepage. A cut-off drain to be successful, should reach the bottom of this porous stratum, and if no investigation has been made the chances are a hundred to one that the darin does not reach the bottom of said stratum. If the drain line cuts through the top of the porous stratum the water can pass through the stratum under the drain, and continue to keep the soil moist.

It can not be too forcibly impressed upon the farmers that the proper drainage of land is a probluem which requires careful study by an expert, and it will be money well spent to secure the services of a competent engineer before installing a drainage system upon your land.—E. B. House, Colorado Agricultural College, For Collins, Colorado.

Features Gathered From the N. B. Women's Institute Reports

Owing to the Third Annual Report of the New Brunswick Women's Institutes being limited to a certain number of pages, we publish in concise form through the pages of the Maritime Farmer, the year's report from each Institute, up to October, 1915, and in this way hope to give the public an idea of the variety and endless amount of commendable work being accomplished by the Women's Institutes. (Supervisor's note.)

FEATURES GATHERED FROM INSTITUTE REPORTS.

Albert.—Organized October, 1913. Membership, 42; average attendance, 19. Ten copies of Canadian Home Journal taken. Since the war started, time and money have been devoted to patriotic work. Money raised by selling ice cream, home-made candy, fancy sale, basket social and garden party. Sixteen Dollars and Fifteen Cents sent to the Home Relief Fund, $90.00 to the Patriotic Fund, and $20 to the Belgian Relief Fund. To equip a bed in the Cliveden Hospital, England, $50.00 was forwarded, $42.00 of this being raised by an autograph quilt. This quilt when finished will be sent to the same hospital. Twenty-two complete outfits sent to Belgian children, also five large and two small quilts and four large boxes of second-hand clothing. One hundred and seventy-two articles sent to soldiers and Red Cross headquarters.

Elgin. — Organized October, 1913. Membership, 17; average attendance, 8. Money raised in the following ways: Conundrum Supper, $20.05; Dime Tea, $8.30; Ice Cream Social, $13.20; Patriotic Concert, $45.35. Ten Dollars given to Patriotic Fund and $33.20 expended on yarn. One box of clothing sent to Belgians.

Hillsoborough. — Forty-three members enrolled. Meetings held regularly each month. Money amounting to $90.50 collected and expended on material for the soldiers and supplies for the Belgians. At the April meeting a very instructive talk and demonstration was given by Miss Jonah on "Tea, Cocoa and Coffee. "Queen Mary" Tea held on Sock Day, when results were very gratifying. One debate held during year, "Resolved that Heredity has greater influence on the Character than Environment." Negative side won. A house to house collection netted $100.00 which went towards endowing a hospital bed. Very enjoyable pic-nic held in the summer.

Hopewell Hill. — Organized July, 1915. Membership, 17. Garden Party held August 4th, when through sale of ice crea $15.50 was raised for Patriotic Fund. To swell the contribution to the Soldiers' Disablement Fund, ice cream and candy will be sold at the Agricultural Exhibit to be held at Hopewell Hill, October 19th. Each member of the Institute will also provide a bottle of pickles and preserves which will be offered for sale. Actively engaged in Red Cross work.

Benton.—Organized October, 1914. Seventeen members enrolled. Since then membership has increased to 24. The printed programme found very helpful. A visit from the Debec Institute in January and in March the Debec branch returned the compliment. These exchange of visits were about the most beneficial part of the year's work. For Red Cross, 229 articles were made by the members. As a result of "Tag Day" $7.45 was realized to purchase yarn. An Ice Cream Social netted $34.19 and $25.00 of this went towards the Soldiers' Disablement Fund. Treasury further increased by $7.50 as a result of selling "Allied for Right" buttons and this was given to the Ambulance Fund. By meeting together with one common interest, better acquaintance has resulted. It has developed a deeper interest in one another, and in those who are not members, giving a broader outlook, being more thoughtful of others, and deepening the interest in all that pertains to the good of "Home and Country.

Debec.—A membership of 28, with an average attendance of 21. Canadian Home Journal found in many of the homes and a number of the members wear the N.B.W.I. pin. Concert held last November, when $67.50 was raised for patriotic purposes. Twenty dollars realized from an Ice Cream Sale in July was used to defray the expenses of delegates to the Convention, and other Institute work. Twenty-eight pairs socks and 43 housewives donated by the Institute and more would have been accomplished had it not been that a Red Cross Society was formed and the Institute members joined. The Agricultural Society of Debec presented the Institute with $5.00.

Florenceville. — Organized as we were in 1912, with a membership of about 30, we have become a society with an enrolment of 57. Thus we have grown in numbers and I feel quite safe in saying in interest as well. Our meetings are held on the second Tuesday of each month at the various homes of the members and the programmes carried out are particularly interesting and enjoyable. Two and sometimes three papers are read and discussed at each meeting, and as often as possible a demonstration of work done in such branches of housework as sewing, cooking, home-nursing, etc., is given. The work prepared for our programmes does not relate entirely to housework. Several papers on current events have been carefully prepared by certain members, with the result that our outlook upon the work of the world in general has been broadened and a greater interest in the lives of our fellowmen has been manifested. Then again, transcontinental trips taken and enjoyed by a few of our associates have been given to us in written version and have awakened in us keen interest in the beauties and work carried on in our sister provinces, seemingly so far and yet so near to us.

Still another departure from our usual routine we have tried and so far has pleased all concerned. Listen carefully! We have allowed a man

GROW STRAWBERRIES

Strawberries are the first money crop of the year, and bring in the cash at a time when cash is much appreciated. Let the young people on a farm look after this crop, for besides the profit, there is real joy in growing Strawberries. Have your boys get a practical start in business farming by keeping cost accounts on an acre of berries. Let them compare the profits on that acre with acres in other crops. Their figures may give you a surprise too.

Our plants are grown on deep soil, this means good roots, and are carefully dug and packed to reach you in perfect condition for planting. The most popular variety grown in the Maritime Provinces is the Senator Dunlap. Our Dunlaps, $3.50 a thousand. In orders of 5000 or over, $3.25 a thousand. Other varieties Sample, Ophelia, Arnout, Williams, etc. Send for Catalogue.

to enter our sacred portals, but he has fully recompensed us for our laxity (would you call it?) — not in rather our faith and trust in our brother man. Would that you could have enjoyed with us Rev. G. A. Ross' address on "Canadian Literature" and again on "The Home and the School." I shall try to give you a glimpse of that delightful realm of thought.

Our reading has been so successfully tested that on this coming year's programme, names of two more gentlemen appear.

In "Canadian Literature" Mr. Ross says in part:

'The glory of a nation is its literature, for this is the reflection of its character, the sure index to the quality of its life. Themes for a nation's poets are furnished chiefly by an extraordinary history. At least it is the songs which treat of those epochs and events in which a nation has suffered and achieved which take the strongest grip upon the nation's heart. Apart from the literary ability displayed, which is of a high order, the good taste upon the pages of Canadian novels radiate healthy moral aroma, and leave a sense.'

Listen to what the reverend speaker has to say in "The Home and the School." 'The growing efficiency which is characterising modern educational efforts is due to the arrival of a more comprehensive understanding of two matters, First of what education is and second of what the being is who is to be educated. Educational methods have been planned with a view to development, not with the putting of a large catalogue of information into a mind as an end in itself. The child is Nature's seedling of intellect, reason and will. The home is the garden to which it has been transplanted. The work of the teacher is facilitated or hampered according as conditions in the home are wholesome or otherwise.' He warns us that in our homes we should be careful to conserve the influence of the teacher with our children in every possible way.

Now let me tell you of some of the papers relating to housework which have been so helpful to us. "Saving Steps in the Home," written by Mrs.

(Continued on page 506.)

McClary's Blue Flame Oil Stoves make good "Goodies" quickly. No hot summer kitchens. No wicks to trim—no valves to leak—safe, simple, economical, reliable. Costs less than a cent per hour per burner.

McClary's

FLORENCE

OIL COOK STOVES

Wickless, Valveless, Blue Flame, Automatic

You can have a slow simmering fire on one burner and a quick hot fire on another and also two others regulated exactly to any heat you want. Just set the letters to exactly the heat you want—you can go away for hours and find all the burners giving exactly the same heat when you come back. That is because the oil supply is automatically kept constant.

A glass bull's-eye always shows you how much oil is in the tank. The upper reservoir holds a gallon.

Ask your dealer to show you the Florence—if he cannot, write to our nearest branch.

Get This Power Sprayer

For 30 Days FREE TRIAL

Use it for your First Spray and if Not Satisfactory, we will Take it back and No Expense.

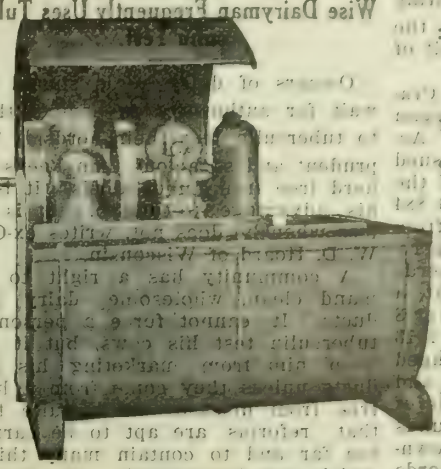
Each machine guaranteed for 2 years against REPAIR.

Each machine will handle 2 lines of hose at 250 lbs. pressure, deliver 6½ gals. mixture a minute and easily apply from 1200 to 1500 gals. a day.

Engine can be instantly released for other POWER PURPOSES, such as sawing wood, etc.

Engine parts interchangeable with "Ford" motor parts. Therefore engine is standard.

I. X. L. JUNIOR Automatic Power Sprayer



The I. X. L. Junior is made in two styles. It consists of a 3¼ H.P. Engine, cypress tank, gear driven vertical cylinder pump, two 25 ft. leads of Hose, two visible spray nozzles, complete in all details.

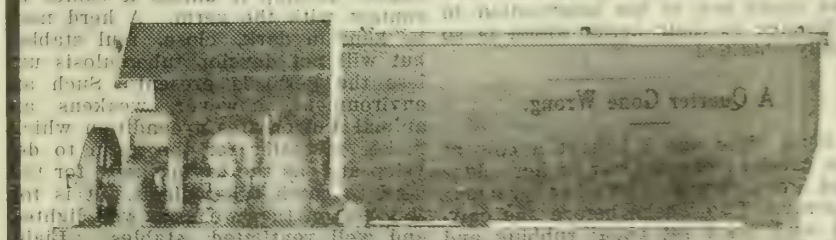
Weight, 450 lbs.

I. X. L. with 100 gallon tank, $165.00
I. X. L. with 150 gallon tank, 170.00
I. X. L. with 200 gallon tank, 180.00

For rough or hilly orchards, common in some parts, the machine which best fills the requirements is our back-mounted.

Pontiac Special

Automatic Power Sprayer



This machine is equipped with the same engine as the I.X.L. and is made with two size tanks.

150 Gallon Tank, 50 ft. Hose, 2 poles $200.00
200 Gallon Tank, 50 ft. Hose, 2 poles $210.00

We have prepared a valuable booklet entitled, "Prize Fruit and Vegetables from your Orchard and Garden," which is free to all farmers, fruit and vegetable growers. Use the coupon and send for your copy to-day.

DAIRYING.

A Word to the Wise is Sufficient

At the Dairymen's meeting held in Charlottetown recently, Mr. George Burgess, Dairy Recorder of Crapaud, who has charge of the cow testing work in that district, submitted the following in reference to the result of his work:

In 1914 sixty patrons of the Crapaud and Tryon creameries began keeping records of their herds. According to annual statements issued by these creameries the herds of the sixty patrons in 1913 average 884 pounds of butter fat per herd; from the 1915 statements, after keeping records only two years, the sixty herds averaged 955 pounds of butter fat, a gain of 71 pounds of fat per herd, or 8 per cent. On the other hand in 1913 patrons not keeping records averaged 503 pounds of butter fat per herd, and in 1915 they averaged 416 pounds of butter fat, a falling off of 87 pounds per herd, or 17 per cent. Had the owners of the herds not keeping records made the same gain in the two years as those who were, it would have meant a gain of twenty-five per cent on what they supplied in 1913, equal to an increase of 58,362 pounds more of butter in these two creameries.

Mr. Chas. J. Cooke, Recorder of the Kensington district, also submitted figures showing equally as good results. Both Recorders report the farmers as taking a great interest in this important branch of their dairy work, which will evidently mean a decided increase in the profits from dairying to all who take up the work and make use of the information in reference to their herds which is so easily obtained.

A Quarter Gone Wrong.

Some time ago I bought a cow at her calving; one quarter of her udder had gone wrong after her previous calving. Two weeks before she calved with me I set about rubbing and milking the quarter, hoping to improve it at least samewhat, and in this I succeeded beyond my expectations. This season I have a similar case, only that I think this is one of longer standing than the first. Can you recommend anything that would be likely to help me in my endeavours? I may say that the teat has been always open, but gave little milk. — Subscriber.

Answer: No, we cannot recommend anything that would be likely to help you in your endeavors, indeed, we strongly recommend you to desist—that is, to drop your endeavors to obtain a partial resoration of function. You will be in a better position than anyone else to judge whether you were sufficiently rewarded for your endeavors in the case in which you say you succeeded beyond your expectation, but our experience is, and it is the experience of the majority of practical cowkeepers, that it is better to have a "lost" quarter, and a "three-papped cow," than to have one with a partially active quarter, with the time and trouble to be expended in getting from it a small quantity of milk that does not pay for taking. To a case of mammitis there are half a dozen possible terminations—resolution, atrophy, induration, suppuration, gangrene, and death of the animal. Resolution, which is far the most rare, is the most favourable termination, since it means complete recovery, or restoration of function. The most common sequelae are atrophy and induration, and in both there may be isolated lobules of the gland which remain intact, and secrete the little milk that industrious dragging at the teat enables the persistent man to extract. When the inflammation has gone, and it is obvious that the secretory power of the larger portion of the gland structure is lost, the experienced cowkeeper what he calls "lets it go," that is, makes no further attempt at milking, and, recognising the inevitable, calls the quarter "lost." In tinkering with cows with defective quarters you will be sure to cause some trouble.—M.R.C.V.S.

Wise Dairyman Frequently Uses Tuberculin Test.

Owners of dairy herds should not wait for authorities to compel them to tuberculin test their herds. The prudent and sagacious man keeps his herd free from tuberculosis. It is to his advantage to do so. It is his loss when he does not, writes ex-Gov. W. D. Hoard of Wisconsin.

A community has a right to demand clean, wholesome dairy products. It cannot force a person to tuberculin test his cows, but it can keep him from marketing his products unless they come from a herd free from disease. It is quite true that reforms are apt to be carried too far and to contain many things which are impractical. It is not possible for a province or a city to send out men to test cows and if reactors are found elminate them from the herd and in this way clean up the diseased animals, unless they have the co-operation of the owners to follow out certain principles necessary to free a herd from tuberculosis.

Perhaps it would be well for us to discuss a few things that should be done and to indicate the limitation of the tuberculin test and the nature of tuberculosis. In the first place, tuberculosis is a germ disease. An animal cannot develop it unless it comes in contact with the germ. A herd may be kept in dark, close, foul stables but will not develop tuberculosis unless the germ is present. Such an environment, however, weakens an animal and creates a condition which makes it easier for the germ to develop and, as the saying goes, for the herd to catch tuberculosis. It is for this reason that we urge well lighted and well ventilated stables. Light destroys germs, and fresh air is necessary for healty cattle.

The tuberculin test is the only diagnostic agent for tuberculosis. It is impossible for a person to elimiate tuberculosis from a herd by physical examination. There are no symptoms which alone characterize this disease. Because an animal coughs is no sign that it has tuberculosis, nor because it is thin in flesh does it follow that the disease is present. On the contrary, an animal may be fat and have tuberculosis. It is unfortunate that tuberculin does not point out the disease during the incubating stages or show animals that are infected. It can be said that when an animal is properly tested with tuberculin and a characteristic rise and fall in temperature follows, there is little question but that the disease is present. Then, too, an animal may be so far advanced with the disease that she will not respond to the tuberculin test. In such cases a physical examination will usually determine the presence of the disease.

BOOK ON
DOG DISEASES
And How to Feed
Mailed free to any address by the Author
H. CLAY GLOVER, V. S.
118 West 31st Street, New York

The use of tuberculin in many instances has been misunderstood. It is thought by not a few that if a herd is tuberculin tested and the reactors eliminated, that the herd is clean of disease. This is not the case. There may be several animals in the herd that have been exposed but do not react, for the disease in the incubating stage is not revealed by the tuberculin test. When reactors are found in the herd a retest should be made in six months. It is held by many that when 50 per cent of a herd responds to the tuberculin test it is safe to consider all the herd tubercular, for sooner or later the other 50 per cent are almost certain to develop the disease.

In such instances as this, and where it is desirable to raise the calves of the cows reacting, it is well to follow the Bang System. This system provides for the separation of the young calves and does not permit them to drink any of their mother's milk unless it is pasteurized; that is, heated to a temperature of 150 degrees F. and kept there for twenty or thirty minutes. Care should always be taken to prevent the carrying of the infection from the mothers to the calves.

The question is frequently raised as to whether tuberculin injures a cow. It may be said that the cows on our own farm have been tested for fifteen or more years. Some of the cows at the present time are fifteen years old. They have received tuberculin for thirteen or fourteen years and are still in good health. In all our experience we have never seen any injurious results following the use of tuberculin. Doses forty times larger than is necessary for testing purposes have been given cows before any symptoms of sickness followed. It is understanding these few principles thoroughly and following them out that will in time rid a herd of tuberculosis.

The Testing of Dairy Products

The price of success is attention to detail. This fact is distinctly emphasized in a bulletin recently issued by the Dairy and Cold Storage Branch of the Federal Department of Agriculture under the title of "The Testing of Milk, Cream and Dairy By-Products by means of the Babcock Test" and written by J. F. Singleton, Chief Inspector of Dairy Products. Without being profuse Mr. Singleton tells in plain language about all that is to be told of the practical application of the test, the care that should be taken of the component parts of the apparatus, the measurements advisable and the methods that should be employed. The qualities naturally most emphasized are exactness, cleanliness and temperature. The Dairy Commissioner in his introductory says there is nothing fundamentally new in the bulletin but that the contents are presented with such a clearness of diction and the processes so aptly set forth that the result is a reliable handbook for those who value information on the testing of milk, cream and so on. A number of exact plain illustrations lend additional worth to a notable bulletin, the number of which is 45 of the Dairy and Cold Storage Series, and that can be had by post-free application to the Publications Branch, Department of Agriculture, Otawa.

DE LAVAL
Stands On Its Record

FOR nearly forty years the De Laval Cream Separator has led in the cream separator field. It was the pioneer in 1878. It had a long start and has always held its lead. It has always led in every step of cream separator development and popularity, and more De Lavals are in use today than all other makes combined.

It has always been recognized as the closest skimming cream separator. That's the main reason why 98% of the world's creameries use it to the exclusion of all others.

Because of its cleaner skimming, ease of operation and wonderful durability, every De Laval user is a "booster" and the better its work is known in a neighborhood the more popular it becomes.

The better quality of cream it produces is attested by the fact that De Laval produced cream and butter have scored highest at every annual contest of the National Buttermakers' Association for twenty-four years and in every great representative contest for over thirty years. Last but not least, the De Laval was awarded the Grand Prize at the San Francisco Exposition in 1915 as at every other great exposition since its invention.

The creamerymen's choice can't be far wrong. The world's greatest dairymen and mechanical experts who act as judges at the great expositions can be depended upon to recognize real merit, and the fact that the De Laval is the choice of the majority of all cream separator buyers must mean a good deal to you. In your purchase of a cream separator can you afford to ignore these considerations?

LIVE STOCK.

Prevention of Transmissable Live Stock Diseases.

Dr. L. Van Es, North Dakota Experiment Station.

Changed conditions and circumstances are rapidly forcing the Western farmers into a method of agriculture, in which the raising and exploiting of livestock forms an essential part, and, if this stock raising is to fit into the general system of agriculture, the farmer will have to use his brains so as to make his efforts profitable. He is compelled to select his breeding stock intelligently, he must feed so as to obtain the maximum result with a minimum of expenditure, he is forced to watch general economic and market conditions, and apply them to this management, and, last but not least, he must be forever rt with a view to excluding the losses from disease. The importance of the prevention of disease is not confined to the individual stock raiser, but it is vital to every other owner of livestock, because many diseases do not remain confined to just one herd, and it is this general importance which perhaps justifies us to give some thought to preventable disease. The diseases which we wish to include in this series are especially the contagious and infectious ones, as they are the ones which are responsible for the greater amount of loss.

Several years ago, it would have seemed absurd to address a body of farmers on such a subject, because at that time there was no rational base for the prevention of disease. The transmissable diseases were still surrounded by darkness, and it was not until science explained their causes that methods of prevention became possible. The discovery that the causes of those diseases were absolutely specific in their nature, that in other words, one micro-organism could cause but one given disease, and nothing else has enabled us to design ways and means to prevent the spread and introduction of those germs, has caused us to study those various bacteria as to the conditions which are favorable to them and which are not, and above all has made us better acquainted with the phenomenon of immunity and its artificial production.

The Practical Stockman's Part.

The forces available for the systematic prevention and eradication of the transmissible animal diseases are three-fold.

In the first place, we have the man on the farm, the man who is directly interested in livestock. As little as he thinks it, he is the most important factor in the elimination of disease above all others. He can do more towards its eradication than anybody else, because he, in many instances, can refuse admittance of disease to his herds and flocks. He can do so by being careful, by learning just a few simple facts about disease and by learning them well. He need not worry himself about diagnosing the trouble, about recognizing specific lesions, after death and such things; he can leave such problems to be decided by his veterinarian, but he should remember such simple facts as that an infectious disease never does originate spontaneously, that the infection is carried among his herd in some way or other, and he should know and understand these ways, and he should also know where to look for them, while he should always be willing to take a few simple precautions before taking chances.

Take tuberculosis in cattle for example: Here is a disease which actually exists because cattle owners permit it to do so. How? Let us cite the instance of a man who wants to improve his stock or who wants to go into livestock. He will perhaps consult his farm paper and see if any sales are advertised. There usually are, and he proceeds to stock up at one or more sales. He is careful about the animal's breeding, qualities, etc., but in nine out of ten cases he never inquires into the possibility of this animal bein tuberculous. Yet, it is possibly difficult to buy ten such animals without getting one or more infected ones. In many instances such infected animals are turned into a herd without challenge, and the result is that in due course of time something wrong is discovered, a test made which discloses infection in the greater part of the herd. A little precaution would have caused quite a saving in such a case.

Take, again, the disease known as infectious abortion, one of the most damaging diseases to dairy and breeding stock. How often it is caused by the infection of the herd bull by service of cows coming from some unknown source or of cows having a vaginal discharge. Here, again, the vigilance of the owner or the simple refusal of public service could have prevented a very serious loss.

In glanders it is often the owner's neglect or carlessness that is responsible for great losses. Many farmers, even if they know that glanders is prevalent in their vicinity, will, without hesitation, tie their horses in any sort of feed stable or water them from any public drinking troughs that come handy. They will trade or buy horses from the first outfit of gypsies that comes along and are ready to swallow the tale of the new purchase having a "snotty nose" on account of a cold caught in the last rain and the swollen leg being due to "got hurt in the car," that threadbare lie so familiar in the mouth of horse traders. A little care and caution would certainly go a long way toward keeping glanders out of a stable.

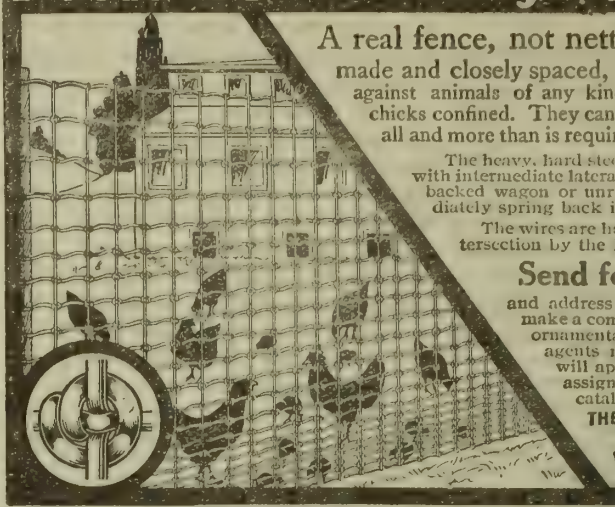
Blackleg in cattle is another disease that is nearly entirely handled by the farmer himself. Expensive experience has taught him that when this disease once occurs in a given pasture or field, it is very liable to keep on doing so for many years. He has learned that he must systematically vaccinate his young stock every year and, whether he does this himself or leaves it to his veterinarian, he is the one who must make the initial wound.

There are many other diseases in which, by timely discovery, isolation, disinfection, etc., the farmer himself is the most efficient factor in prevention.

The Veterinarian.

The second forceful factor in the elimination of disease is the practising veterinarian. Scattered over the rural and stock raising sections of the country, he is always in reach of those needing expert advice. He should always be consulted in case of sickness of animals. In cases of any unexplained deaths, he should be engaged to make a careful investigation. In all such instances a properly trained

Peerless Poultry Fencing



A real fence, not netting. Strongly made and closely spaced, a complete barrier against animals of any kind. Keeps the small chicks confined. They can't get through. Does all and more than is required of a poultry fence

The heavy, hard steel top and bottom wires with intermediate laterals will hold a carelessly backed wagon or unruly animal and immediately spring back into shape.

The wires are held together at each intersection by the Peerless Lock.

W. H. Shaw, Pres.

IF YOU HAVE LIVE STOCK FOR SALE ADVERTISE IN THE MARITIME FARMER.

veterinarian can give reliable advice. Such a man is a valuable asset to any rural community, and stock raisers should encourage him by seeking his services. On the other hand, the veterinarian owes it to his community to keep himself will informed on the subjects pertaining to his profession and on the advances made by science. He must always remain a student, because then only will his value increase as he gathers experience.

His influence, however, is not limited to the giving of advice. Most of the methods of eradication disease require trained workers and supervision, whether they are undertaken by individual efforts or under the auspices of the state livestock sanitary authorities, and for their proper and economic application the veterinary practitioner must be depended upon in many cases.

The Government's Part.

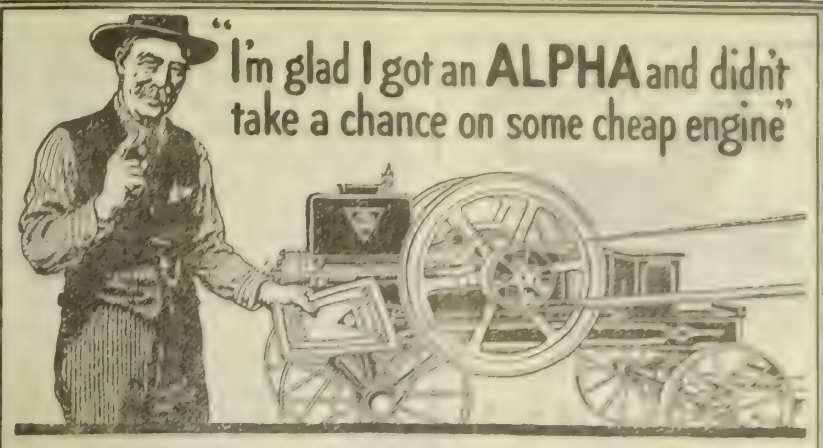
The third power is the Commonwealth itself, because the prevention of disease is pre-eminently a duty of government and the influence of intelligent state action is extremely beneficial.

In order to accomplish good results, however, the state must have at its command an efficient organization operating under laws so constructed that the necessary action can be taken under any circumstances which may arise. The authorities in charge of the work must be given power to make regulations and to enforce them. They should not be hampered by lack of funds.

The best livestock sanitary police organized to fit into such conditions as are found in this country is an appointed sanitary board operating through the executive officer and a staff of assistants. Under its direct function comes the supervision of the movement of livestock into the province or state, the establishment of quarantines in cases of outbreaks of disease and the proper disposal of animals affected with dangerous diseases and of carcasses dead with such disorders. Such an organization should be provided with sufficient funds to enable it to make tests for tuberculosis and glanders without expense to the owners and to undertake the immunization of animals, wherever and whenever this could be done to advantage.

In North Dakota a good working organization has been obtained by the establishment of the Live Stock Sanitary Board some years ago. Since its inception this board has accomplished a great deal for the state. It has brought glanders under control and is well on the way to bring about its complete eradication. It has established a fairly efficient supervision over animals entering the state. It is managing the tuberculosis problem in an enlightened manner and probably by this time its fight against dourine is brought to a successful close.

It is not my intention to sing the praises of this board, but merely to point out that it is an important factor in preventing our heavy financial losses from disease. It is an institution which not only deserves the confidence of our livestock owners, but must have also their full co-operation. Such things as prompt reporting of suspicious cases, a thorough compliance with regulations, orders and suggestions, will have a far reaching result in the prevention of disease.



SOMETIMES a man is tempted to buy a cheaper engine than the Alpha, hoping to save a little money. If you are tempted to take such a chance, it will pay you to first study engine construction carefully. It is only reasonable to assume that if other engines were as good as the Alpha they would cost just as much. Why shouldn't they?

In considering the purchase of an engine, do not let the first cost blind you to the vitally important things you wish to buy in an engine. You want an engine that has plenty of power; that is simple and easy to operate, that is free from weak, complicated, troublesome parts; that is strong and durable enough to give you years of good service. With these things in mind, compare the Alpha, part for part, with any other engine. You will then see that for the slightly higher cost of the Alpha you get by far the most for your money.

Then talk to any of the thousands of Canadian farmers who are using Alpha Engines and they will tell you they are glad they did not take a chance on some "cheap" engine. It does not pay to take chances. Be on the safe side and buy an engine that sells on its merits; that has something more than its price to recommend it.

There is nothing mysterious about the superiority of the Alpha. The better design of this engine, the quality of material and workmanship that go into it, are easily seen. Ask for a copy of our catalogue. It illustrates and describes every feature of the Alpha and every feature of this engine has in it some sound reason why the Alpha will give better service and last longer. Read the catalogue carefully and you will see where the extra value comes in.

Alpha Engines are made in eleven sizes—2 to 28 H.P.—each furnished in stationary, semi-portable, or portable style, with hopper or tank cooled cylinder.

THE HORSE

Mare With Sweaty Legs

I have a little brown mare, having a lot of straight black hair on the fetlocks and pasterns. From the place indicated in sketch she emits a profuse liquid, not of the malignant form like "grease," but more like sweat, and which, in a few hours, thickens to the consistency of lard. In a few days after washing it begins to shell, and I have hitherto (about once a week) washed it with warm water and carbolic soap, bandaging until dry. There is no sore. When at grass I have difficulty in keeping it from being blown by flies. What would you suggest as being a suitable agent to apply to counteract the sweating, or keep it sanitary? How would the "white bottle," with a little carbolic in it, do?—A.S.

Answer: There are ever so many grades of inflammation of the skin of the heels, or forms or manifestations of "grease," and one of them is the pinkish-white discharge described as causing trouble in your case. There is no doubt but that it may be correctly classed as a case of "grease," and treated according. With reference to this, the suggested employment of the "white bottle" with a little carbolic acid in it, would be eminently suitable. A good recipe for this is 1 oz. each of acetate of lead and sulphate of zinc dissolved in a quart of rain or distilled water. This, although not a chemically correct mixture, is very useful in the form or stage of grease from which your mare suffers. We should, however, strongly advise you to drop the washing of the legs, beyond what is absolutely necessary to remove any accumulation of dried discharge, and to adopt the dry system of cleaning. The case is obviously one of "grease," associated with an inherited, breed, or constitutional predisposition, and in such cases constitutional treatment can advantageously go hand-in-hand with, or supplement, local dressings. An example of medicine that may be useful is : Sulphat of copper, chlorate of potash, and powdered gentian, of each 1 drachm; powdered resin and nitrate of potash, of each 1 1-2 drachms; powdered nux vomica, 20 grains; Castile soap powder, and Venetian turpentine to form a 1 oz. ball. Get a dozen made, and give one every night until exhausted.

Ring-Bone

There is no case so old or bad that we will not guarantee

Fleming's
Spavin and Ringbone Paste

to remove the lameness and make the horse go sound. Money refunded if it ever fails. Easy to use and one to three 45-minute applications cure. Works just as well on Sidebone and Bone Spavin. Before ordering or buying any kind of a remedy for any kind of a blemish, write for a free copy of

Fleming's Vest-Pocket Veterinary Adviser

FLEMING BROS., Chemists,
45 Church Street, Toronto, Ont.

Mare With Lampas

I have a young mare suffering from lampas. Could you tell me the best way to treat her, and cure?—Milkman.

Answer: "Lampas," concerning the character of which exists a great deal if misapprehension, and also needless anxiety, is the name given to a swelling which arises from congestion of the blood vessels in the lining membrane of the palate, the enlargement of the bars being mostly seen in young horses during the process of teething. It occurs occasionally in old horses from irregularities of the teeth, or it may arise in any animal from inflammation set up by bit injuries, but for all practical purposes "lampas" may be regarded as a juvenile trouble, and as the mare in question, said to be "suffering from lampas," is described as young, the probable cause is dental changes. Owing to the inflammation of the gums set up by irritation caused by the eruption of the permanent incisors extending to the palate, it swells and becomes level with or even projects beyond the nippers, and causes feeding to be a somewhat painful business. Colts at grass rarely suffer much, as their food is natural—cooling, tender, and easy of digestion—but the animal that has been taken into work, and fed with hard corn and dry hay, finds mastication painful, and often falls away in condition. Generally, an alteration in the diet to crushed oats and wet bran with scalded chaff, tender green meat in season, or carrots, &c., in winter, at the same time easing the work, will suffice to effect the cure, because in a few days the inflammation and soreness pass away, and the colt can feed again in comfort. In persistent cases, or where the congestion is considerable, and the swelling projects beyond the incisors, all that is necessary is to lightly scarify the swollen palate with a lance or sharp penknife. These superficial incisions result in the flow of a little blood, which promptly relieves the local congestion. A few does of cooling medicine —say 2 oz. of Epsom salts and a little gentian or aniseed—in the soft food once a day soon results in the disappearance of the swelling.—M.R.C. V.S.

Look After Your Horses Teeth and Dodge Colic

There are many different kinds of colic in the horse and impaction colic is one of the most fatal. Impaction colic is caused by improperly masticated food resulting from bad teeth. A horse is said to be as old as his teeth. Occasionally a ten-year old horse is found with such bad teeth that he is already found to be a hard keeper.

The period of usefulness of a horse —and in many cases of his life—may be prolonged several years by proper attention to his teeth. The food that a horse eats is not cooked for him and his grinders must be in almost perfect condition, otherwise he becomes a hard keeper. The teeth should be given attention as often as once a year. It is poor economy to feed a horse all he will eat and still have him in poor condition and capable of giving only a mediocre service in return.

Be merciful to your horse by not neglecting his teeth. He is doing the best he can for you.—H. S. Eakins.

Who Fits the Horse Shoe ?

Many horses have their feet ruined by poor caretakers. In some cases the idea of shoeing is never given a thought and the hoofs are allowed to be their own caretakers. If the animal is stabled or our in soft pasture land the hoofs will grow rapidly with little wear and, when put on the hard road, they crack and break off to the injury of the horse's feet.

It takes very little care to trim off the rough corners and avoid any serious trouble. There are times and conditions that require a horse to be shod to work at his best efficiency.

There is another class of people that shoe a horse and never reset the shoes until they are worn out or lost. To treat a foot properly, the horse should be shod and have the shoes reset every month or six weeks. In the case of young horses that are not mature, it might be well to even reset them oftener. If the horse is off the road for a month or two in summer pull off the shoes and allow him to walk on the bare ground.

If a horse wears shoes continuously, the hoofs will have a tendency to become hard and dry. This can be overcome by applying fish oil to the hoofs just below the hair line twice a week. This will keep the hoofs growing nicely, and as they grow out they will not become quite so hard. This is a part that the owner of the horse can easily look after.

Does your village blacksmith or horse shoer know how to fit and drive a shoe?. In all too many cases with the horse shoer, it is the case of making the shoe and pairing down the hoof to fit it instead of fitting the shoe to the foot.

The shoe is generally fitted too small for the foot. It is nailed on, and the nippers and rasp are used to bring the foot down to the size of the shoe. Yes, it all looks smooth enough, but the wall of the foot has been cut down and removed almost to the quick.

It is far better to round out the hoof, make the shoe to fit it and then knock off the rough edges with the rasp. It may not be quite so neat

Totally Discouraged by Nervous Prostration

After Many Weeks of Doctoring a Friend Recommended Dr. Chase's Nerve Food, and She Was Cured.

There is nothing more discouraging than Nervous Prostration. Because of the exhausted condition of the nervous system, weakness and helplessness take possession of the body. The faculties of the mind as well as those of the body are affected and hope and courage disappear.

The patient, often appearing well, gets little sympathy, and few doctors understand diseases of the nerves well enough to treat nervous prostration intelligently. Dr. Chase's Nerve Food is founded on the prescription of a great nerve specialist, and hence its wonderful success in curing ailments of this nature.

Mrs. Edith May Williams, Tillsonburg, Ont., R. R. 3, writes: "I cannot speak too highly of Dr. Chase's Nerve Food. I suffered for years with my nerves, and at one time I was confined to my bed with nervous prostration for several weeks. I cannot just explain my feelings, but I was weak and helpless and so discouraged and despondent that I thought I would lose my mind. I doctored with several doctors and received but little benefit. At last I became very much discouraged and thought I would never get better. A friend advised me to try Dr. Chase's Nerve Food, and before I had finished the first box I knew that it was helping me. It took several boxes of the Nerve Food to make me well and I can truly say that it is a wonderful builder-up of the nervous system."

It is only wise to prevent such dreaded diseases as Nervous Prostration, Paralysis and Locomotor Ataxia by keeping the nervous system in good condition at all times. When you cannot sleep well, have headaches and indigestion, be warned of approaching dangers and restore the nervous system by using Dr. Chase's Nerve Food. 50 cents a box, all dealers or Edmanson, Bates & Company, Limited, Toronto.

CONSTIPATION

Is Productive Of More Ill Health Than Anything Else.

If the truth was only known you would find that over one half of the ills of life are caused by allowing the bowels to get into a constipated condition, and the sole cause of constipation is an inactive liver, and unless the liver is kept active you may rest assured that headaches, jaundice, heartburn, piles, floating specks before the eyes, a feeling as if you were going to faint, or catarrh of the stomach will follow the wrong action of this, one of the most important organs of the body.

Keep the liver active and working properly by the use of Milburn's Laxa-Liver Pills.

Miss Rose Babineau, Amherst, N.S., writes: "Having been troubled for years with constipation, and trying various so-called remedies, which did me no good whatever, I was persuaded to try Milburn's Laxa-Liver Pills. I have found them most beneficial, for they are indeed a splendid pill. I can heartily recommend them to all who suffer from constipation."

Milburn's Laxa-Liver Pills are 25c a vial, 5 vials for $1.00, at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

looking a job, but it will be far better for the horse and the purpose for which it is done.

Unless shod for slippery roads, the calks on the working horse's shoes should be low and dull. This gives the frog a chance to touch the ground and act as a buffer for which purpose it is meant. A little care given the horse's feet while he is young, especially at shoeing time, may lengthen his life of usefulness many years.—J. S. Murray.

Discourage Horse Importations

Even if the European war had not put a stop to importations of Percheron horses from France the action of the directors of the Percheron society of America would do so. The registration fee on imported horses was increased to $100 per head, taking effect July 1. The object sought is to discourage the importation of inferior horses, and it is believed this high fee will have the desired effect. Provision is further made to refund $85 of the $100 paid to importers, on horses that are good enough to win at fairs recognized by the Percheron society.

It is believed this action will effectually bar inferior horses, without interfering with the importation of really valuable animals. It has long been known that we breed as good Percherons in America as in France and in as great numbers. Therefore, the shutting down on importations will work no harm to the breed, but on the other hand will be of benefit to American breeders as it will enhance the value of bred-in-America horses.

Better be Safe Than Sorry

"Is there danger in feeding smutty oats straw to horses," asks a reader. "When we threshed, machinery and men became black from flying smut. I though perhaps there would be no danger in feeding this to horses after it had gone through the blower."

Inquiry among feeders and veterinary authorities does not bring to light definite knowledge of danger. Their advice and ours, however, is not to feed the straw. You are taking too big a chance with valuable animals just to get a little extra feeding value from your crop.

Smut is a parasite. In moderate quantities we would pay no attention to it, but where it is so bad there is danger of various ferments and molds developing that might kill the animals outright, while there is a possibility that the excessive amount of smut spores in themselves might prove injurious.

In badly infested grain there is also a possibility if not a likelihood of ergot, a very dangerous parasitic growth that causes abortion and in advanced cases sloughing off of hoofs. Safety First in feding work horses!

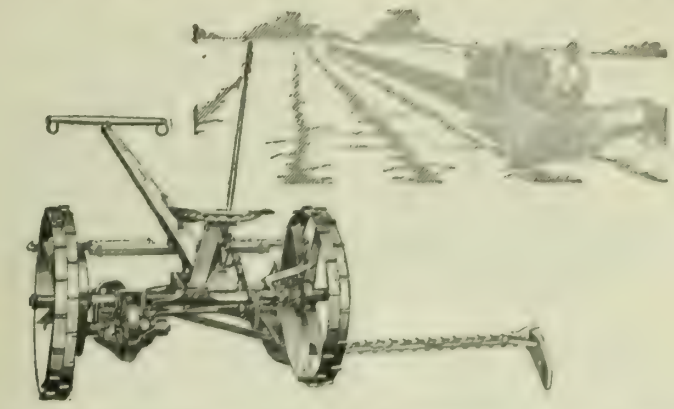
Maybe They Need Work

"My horses are trying to eat the barn," says a farmer. "They gnaw at it and eat big holes in the mangers. I was advised to feed soda in the grain, but it seems to do no good. I feed good clean timothy and oats twice a day and corn at night with carrots and salt once a week."

We don't think there is anything in the soda idea. We have two guesses. One is, that the horses are wormy and the other is that they need exercise. Maybe both guesses are right.

Get a pound of strong smoking tobacco and mix with some bran or other chopped feed as much tobacco as you can get the horses to eat. Let them miss a meal or two before you give them this feed. Afterwards watch for evidence of intestinal worms. Repeat the dose in a week or so.

Get All Your Hay Profit



Once more it is time to prepare for haying. Are your mowers, rakes, side delivery rakes and hay loaders in good condition, ready to get in the whole crop and make money for you in the hay fields? If not, what does your equipment need to make it ready—repairs or new machines?

Get your repair order in early and specify genuine **Deering** repairs for your **Deering** machines. **Deering** repairs are exactly the same as new pieces, made of the same material, from the same pattern. Use them if you want your machines to work like new.

If you need new machines, see the **Deering** local agent before you buy. You know the **Deering** name and reputation. Step in and see the **Deering** mower that cuts clean in all kinds of fields and crops. Ask the agent to show you the new all steel side delivery rakes and the all steel hay loaders that go with the **Deering** line.

Deering machines, this year, are better than ever before. Don't buy until you have seen them, or have received full information from us. Write us at the nearest branch house.

Winter Laying Poultry

We introduce the "Barron" strain of White Leghorns to this part of Canada.

The following are extract copies of Mr. Barron's invoices :—

4th January, 1914.

To 12 White Leghorn Pullets bred from a 260 egg hen, and one Cockerel, brother to my little hen that broke the records of Europe, Canada and America with 282 eggs.

21st March, 1914.

To 12 White Leghorn Pullets and three Cockerels from 260 egg pedigree birds.

This is the strain we offer you, backed up by our assurance that during the severest weather of the past winter our birds were making records considerably over the 200 egg mark.

Eggs for hatching, guaranteed off the above stock, $3 per setting of 13. Unfertile replaced at half cost.

Ten strong, vigorous day-old Chicks, guaranteed off the above stock, $3. Twenty Chicks, $5.

Orders for Eggs shipped now. Orders for Chicks shipped in May or earlier if wanted.

Winter Laying Poultry Pay. Our Birds are Guaranteed Winter Layers

POULTRY

The Day Old Chicken Business.

The day-old chicken has come to stay. There is no doubt whatever about that. For many years past the trade has been extensively carried on in France and on the continent of Europe generally, but it is only within comparatively recent times that much has been attempted in this direction in England and America. It is however, a trade which possesses many distinct advantages, both to the buyer and to the seller. It will be readily admitted by those who have had any experience in the matter that selling or buying eggs for hatching purposes is one of the most unsatisfactory branches of poultry keeping. So many things are liable to happen which will seriously affect the hatching results. The eggs may be broken in transit; during severe weather they may be frosted en route, if they have to travel by train the shaking may do them harm, and affect the chickens when hatched; and, lastly, they may be infertile. As far as this latter point is concerned, it is customary to replace infertiles or return the money, but this by no means compensates for the loss, as in the former case very valuable time may be wasted, and even if the money be returned this does not altogether make up for the loss. When one is buying eggs for hatching only the possibility of chickens can be purchased; no matter what price be paid for the eggs, one cannot ensure obtaining chickens therefrom.

Advantages of the Business.

Fresh blood must be introduced into every poultry yard from time to time, and the purchase of day-old chickens affords a good method of accomplishing it at a comparatively low cost. It is much more economical than waiting till the autumn and then paying from $2.50 to $5.00 per bird. Under these conditions a certain amount of risk must necessarily be run of having a large percentage of cockerels, but they can generally be disposed of at a price that more than pays for the labor and expense incurred. It is essential when purchasing day-old chickens to deal only with a thoroughly trustworthy man, as otherwise the most worthless birds may be sometimes. It is quite impossible at so early an age to distinguish any of their points, and the only guarantee one can have is to buy birds from thoroughly reliable stock. Not only does this trade offer advantages to the buyer, but also to the seller. If one possesses only a small area of land it may be divided up into runs, and stock birds maintained thereupon, the chickens from which can be disposed of as soon as hatched. I know a man who, having only a few acres, has erected scratching sheds and runs, and keeps his holding heavily stocked with pens of Buff Orpingtons, Plymouth Rocks and Wyandottes, all the chickens from which, numbering many thousands, he sells directly from the incubator. The breeders that he requires every autumn to replace the two-year-old hens he buys from among those who have had his chickens. There are several breeders who turn out anything from 50,000 to 100,000 chickens a year, while there is a very large number indeed who sell a few thousand every spring.

Chickens from Matured Stock.

I have heard complaints from time to time that rearing results have not been good with bought day-old chicks. In a number of instances the blame must certainly lie with the raiser, but in others the quality of the chickens sent out may account for the high rate of mortality. I have for a long time held the belief that it is a very serious mistake to hatch eggs produced by pullets during their first laying season, for if the birds have been laying during the three winter months prior to the time their eggs are incubated, the germs in the fertile eggs cannot possess the same vitality, and hence cannot produce such strong chickens. On the other hand, if the pullets have just come into lay the eggs are produced by immature stock, and again the result must be the same. For many years past, when hatching, I have made a point of only incubating the eggs from birds in their second season, and although not obtaining the same number of chickens per bird I have scored in the higher vitality possessed by the youngsters, and rearing results have been very greatly bettered. I believe that if the sale of day-old chickens was confined to the birds hatched from hens that any complaint that are now made would be groundless in the future.

Demand and Price.

I am often asked by those who are contemplating taking up this business which breeds I recommend. The demand, obviously, is likely to be for those varieties that happen for the time being to be creating the greatest public interest. Should White Wyandottes happen to win the twelve-months' laying competition, for instance, one may anticipate an increased demand for chickens of this breed next season. Should Orpingtons prove successful, the increased demand will probably be for them. At the present time the greatest trade among the general purpose breeds is in Wyandottes and Orpingtons; among non-sitters in Leghorns, Minorcas, and Campines; among table fowls in Sussex and Faverolles. The prices charged for day-old chickens depend, in a certain measure, upon the demand for that particular variety. The time of year has also a considerable influence upon the price, and early in the season, when eggs and chickens are scarce, the price is possibly double what it is later in the spring. Generally speaking day-old chickens of a good utility strain realize about twelve or fifteen shillings per dozen early in the season, while cross-breds may be worth seven or eight shillings per dozen. As the season advances prices drop, until similar birds may be purchased in May or June for half the above amounts. Chickens for exhibition stock are worth a good deal more, but I am not concerned with such birds, and am referring only to good utility stock.

Treatment Before Dispatch.

The chickens, when hatched, are allowed to remain in the incubator until quite dry, when, if they are going only a short journey, they are packed and sent away without receiving any food.

IN WAR OR PEACE

it is the trained man who leads.

This school makes a specialty of training young men and women to fill responsible, good paying positions. Prepare yourself for one of these by taking a course at the

Fredericton Business College

Fredericton, N. B.

Booklet describing our courses of study sent on application.

If the journey is more than a few hours' duration, it is better to teach them to feed before sending them away, so that they can eat during the journey. Some prefer to keep them about a week before despatching them, but I have always found it to answer better to send away as speedily as possible. If the chickens become accustomed to a brooder they do not readily take to another, and the change is liable to give them a check and retard development. Curious as it may appear, chickens travel better when twenty-four hours old than when a couple of days, and every day after they feel the effects more keenly. Should the weather be very severe it is, perhaps, better to keep them a week before sending away, as at this age they are able to withstand the extreme of temperature better.

How to Pack the Chickens.

The box in which the chickens travel requires to be well and substantially made, as no artifical heat can be supplied to them during the journey. The best form is one made of inch boarding lined throughout with felt or flannel, with a thick layer of hay or straw in the bottom. It should be placed upon four small legs or feet, in order to ensure dryness, as dampness would prove fatal. A few small holes should be pierced around the top of the sides, so as to provide the necessary ventilation. There should be a small window on one side, otherwise the chickens will be in darkness, which, during a long journey, would prevent their eating. The lid of the box should either screw on or be tied, on no account nailed, as the hammering has a very injurious effect. During cold weather it is a good plan to hang strips of flannel from the top of the box, under which the chickens can nestle. The size of the box depends, of course, upon the number of chickens there is to occupy it, but no more room should be provided than is necessary. A convenient size for a dozen chickens is 12 inches by 8 inches, by 6 inches high. The hay with which the box is littered should slope slightly towards the centre, in the form of a saucer, so that the tendency will be for the chickens to keep away from the outer walls.
—E. T. Brown, in exchange.

A Good Motto.

A colored gentlemen entered his store to buy a pair of blankets. He was interested in two pairs, one at $4, the other at $6, and the dealer was pointing out the fine points of the better article. The purchaser replied that he had only $4, whereupon the salesman suggested that he could take the $6 pair and pay the difference later on. The reply of the colored man was this: "No, suh, I never hangs my hat higher up den I can reach."

Now there's a whole sermon in the philosophy of that man, and you don't need any person to expound it, either. Extravagance is contagious, and the insane desire to "keep up with the neighbors" may have much to do with a lot of trouble, the blame for which is laid elsewhere.

If there is a sorry spectacle it is when the family with a $1,500 income tries to make as big a splash as the one next door that has $5,000 a year to come and go on.

The motto of the colored man is well worth remembering, and also practicing: Never hang your hat higher than you can reach.

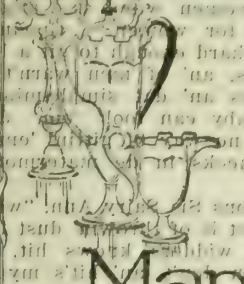
For the unsightly scaly legs, a mixture of lard, sulphur and coal oil will clean them up nicely. It will kill the parasites that are the cause of this rough development. After two or three applications, the legs should be thoroughly washed with castile soap and warm water, and then dried carefully with a warm cloth to prevent the fowls taking cold.

June Weddings

A Wedding Present is just a little different from any other gift. There is a sentiment attached to it, that remains for a lifetime.

Those who are going to make some June Bride the happiest girl in the world, will like to feel that their gift has durable quality and intrinsic merit, as well as the sentiment of remembrance.

Those who choose their gifts from the Mappin & Webb Catalogue, are sure of obtaining the quality that endures.



Mappin & Webb are the largest manufacturing Silversmiths in the British Empire—and one of the two or three great Jewellery Houses of the world. They are Silversmiths by appointment to His Majesty, King George V.—and have stores in London, Paris, Rome, Nice and other foreign cities, as well as in Montreal.

If you have a Wedding Present to buy, write us today and we will send forward the new Mappin & Webb catalogue, free and postpaid.

Mirandy on Widows

By Dorothy Dix.

Sis Sairy Ann is one of dese heah onappropriated blessins whut would make any man a good wife, an' dat ev'y man dat knows recommends to ev'y odder man, but don't grab off for hisself, las' night she come to my house an' she aint mo' dan set herself down comfortable in a rockin'-chair befo' she says to me, "Sis Mirandy, is you done heah dat de Widder Johnsing is gwine to be married again?"

"De lan' sakes!" sclaims I. "You don't say so- Marryin' is done got to be sech a habit wid dat woman dat she can't break herself of hit, fo' dis is de fo'th man she done toled to de altar."

"Dat's right," spons Sis Sairy Ann, gittin mo' an' mo' mounrfuller, "an' hit's my opinion dat dere ought to be some way to have de law on dem women whut's a runnin' a matermonial trust, an' a snatchin' de weddin'-rings right offen our hands, so to speak, an' makin' hit so dat no matter how hard an' industrious us po' single women wuks at catchin' a husban', we can't git one."

"Dat's so," puts in Ma'y Jane, whut's still a roostin' on de anxious seat outside of de fold of matermony, "but de chuch is comin' to our help. Yesterday I was readin' in de paper 'bout a sermon dat a priest preached to widders, an' he told 'em as how no woman ain't got a right to have two husbands when dere are some of his sisters dat ain't got none, an' he admonished 'em not to perk deir caps at de men, but to go a way back an' set down ontil all de gals has done got married."

"Humph," say I, "dat advice listens all right, but I bet you ain't gwine to see no widder take hit."

"Whut I wants to know is how dey do hit," spons Sis Sairy Ann wid a groan.

"Widders suttenly is up-an'-comin' folks," says Ma'y Jane.

"Dere ain't no odder nation of people dat's got de hustle to 'em dat widders is," spons I. "Looks lak dere's somethin' in losin' de partner of yo' bosom dat puts pep an' ginger into you. Why, wid my own eyeballs I's done seed a woman whut's been dat puny an' sickly she ain't been able to lift her han' to cook a meal's vittals, or do a day's washin' fo' ten yeahs, an' de minnit she got to be a widder she git dat filled wid git-up-an'-gitness dat she was able to chase down a able-bodied man, an' ketch him."

"Widders sholy is dangerous," says Ma'y Jane, "an' ef men had de sense dat Gawd promised de fishin'-worm, dey'd run ev'y time dey seed one of dem black veils bearin' down on 'em."

"Shoo, chile," says I, "don't you look for gumption 'bout love in men, for ef you does, you's gwine to be disappinted. De Lawd didn't give men no sense 'bout women, which is a mighty lucky thing for women. Goodness knows, hit's hard enough to git a husban' as it is, an' ef men warn't as blind as bats an' dat simple-minded dat a gal baby can fool 'em, dere wouldn't be no way of gittin' 'em to put deir necks in de matermonial halter."

"Well," spons Sis Sairy Ann, "whutever de secret is of throwin' dust in a man's eyes, widders knows hit, an' single women don't, an' hit's my belief dat hit's a conjer, fo' widders ain't no better lookin', nor no mo' straight fronter, nor no sprier, nor no better cooks dan us ole maids. Yet dey can marry all aroun' us, an' git fo' husbans apiece, whilst de balance of us ain't got none. You needn't tell me dat hit's de widders' superior cahrm. Hit's de way dey wuks deir rabbit-food. Hit's de conjer."

"Naw, Sis Sairy Ann," says I, "hit ain't de conjer. Hit's experience. De ole maid des guesses at whut a man likes, an' how to please him, but de woman whut's done been through de trials an' tribulations of matermony ain't takin' no long shots at how to git aroun' a man, an' soft-soap him, an' rub his fur de right way. She done cut her wisdom-teeth on one husban', an' she knows whut she's 'bout. Matermony has done give her a pint cup by which to measure ev'y odder man dat comes her way. An' dat's whar de widder wins out. She don't make no mistakes. Hit's de difference twixt makin' a cake by throwin' in de ingrediums, hit-or-miss, an' makin' one by a rule dat don't never fail.

"Now a young gal heah, lak Ma'y Jane, when she wants to hand out a line of talk to a man she'll make him set up an' listen an' want to come back again, converses wid him 'bout de books she's been a readin', an' de state of his soul, an' highfalutin things lak dat. An' de man gits de fidgets, an' most goes to sleep, an' when he shuts de front do' behin' him, hit's good night fer him.

"But bless you, honey, a widder wouldn't have nothin' to do wid foolishness lak dat. She wouldn't talk to a man 'bout his soul. She'd know from pussonal observation dat a man ain't got much soul, for he's mostly stomach, an' she'd fill him up on fried chicken, an' chicken-fixings, an' he'd be back de nex' night. Hit ain't high-browed talk dat makes a hit wid a man. Hit's fust-class cookin'.

"Anodder reason why de widder can always cut out a man always to be a-handin' out compliments to her, an' tellin' her how beautiful she is, an' whut a gran' figger she is got, an' dat she suttenly does perambulate lak a fashion-plate.

"Now de widder has done found out from matermony dat a man takes a mighly luke-warm interest in anybody but hisself, an' dat whilst he can converse 'bout hisself an' his job, an' his bicycle, an' his dog to de Judgment Day, an' have a puffectly gran time doin' hit, hit don't take him long to git tired an' frazzled out talkin' to a woman 'bout de things dat she's interested in.

"Darfore a widder kin' of waves away de flattery when a man begins to praise her, an' she des' rolls up her sleeves an' gits busy handin' out de soft talk to de man, an' tellin' him 'bout how big an' handsome, an' strong, an' noble he is, an' whut a gran' job de Lawd turned out when He made him. An' dat does de trick. A gal dat is tryin' to make a hit wid a man sholy does turn out raw wuk when you compars hit wid de professional, polished performance of a widder.

"Den anodder reason why men prefers widders is becaze a man says to hisself dat de widder is broke to double harness, an' dat ef he marries one, he's gwine to save hisself all de trouble of teachin' a skittish gal not to shy at ev'y bugaboo in married life, or a balky one not to git stubborn an' refuse to pull ev'y time she gits riled 'bout somethin' dat don't please her, or one dat's inclined to bolt to stay in de middle of de road. Yassum, a man says to hisself dat some odder man has done fit all dem matermonial fights out wid de widder, an' he won't have to have de bother of doin' hit ef he harries her, an' so dat's why he ups an' pops de question.

"An' he's right. A widder is used to puttin' up wid de cantankerousness of a husban', an' she don't expect a man to be de pin-feathered angel an' romantical hero, rolled into one, dat a young gal thinks she's gittin' wen she gits married. An' a widder is a lots more peaceable wife dan a young gal is. When her husban' don't git home of an evenin' on time, she don't have de high strikes, an' whilst she may meet him wid a rollin'-pin in one hand an' a flatiron in de odder, after de family ruction is over, she'll put him to bed, an' put wet cloths on his haid in place of washin' him away wid a flood of tears, an' de threat dat she'll go back home to her maw or go to co't an git a divorsch.

"An' dat ends de matter, for widders is done found out dat a man can do a lot of sidesteppin' an' still be a mighty good proposition to tie to. Furdermo' a widder dat marries a man don't worry an' nag him none 'bout wantin' to know whedder he loves her or not as long as he brings home his pay-envelop. An' mo dan dat, mos' women kills off deir fust husbans learin' to cook, an' so de man whut marries a widder saves hisself from gittin' dyspspsy. I tell you dat widders is a gran' matermonial risk, an' I don't blame no man for marryin' one."

"I don't see whut widders want to marry agin for," says Ma'y Jane. "Looks lak a woman whut's done had one husban', an' insurance money, ought to be saterfied, an' give some sister woman a chanst."

"Well," spons I, "I specs widders an' widowers both marry agin for de same reason, an' dat is becaze hit's kin' of lonesome not to have nobody to knock yo' faults an' quarrel wid when you has been used to dat diversion. Hit sort of takes spice out of doin' anythin' not to have nobody object to hit nor fight wid you over hit. You misses yo' sparrin' partner, an' you can't be happy ontel you gits anodder one."

"De Good Book commands us to wipe away de tears from de widder's eyes," says my ole man Ike, whut had been a listenin' to de confabulation.

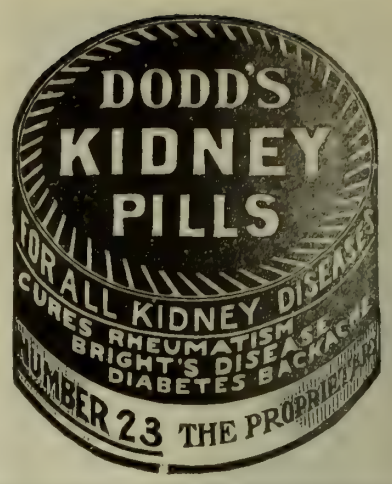
"Well," spons I, "I reckon dat's 'bout de mos' dangerousest job that any man ever ondertook, an' don't you dast try hit when I's dead an' gone."

Our Flag.

"The flag that has braved a thousand years the battle and the breeze."

From the earliest times banners and flags were used and carried by nearly every nation and tribe; these flags or standards were not only carried on land by the soldiers, but were also used at sea on ships and vessels, the flag on the mast showing clearly the nation to which the vessel belonged.

England was one of the first countries to have a navy and display the national flag on her ships. It is unnecessary to trace and describe all the flags used by England during the early centuries, but if we consider the origin of our present flag, the Union Jack will perhaps be enough. As the basis of this flag is the red cross of St. George it might be well to make some mention of his life. St. George was born about 270, in Palestine, in the Vale of Sharon, celebrated for its roses, and so the rose is the national flower of England. He was a Christian and was put to death as a martyr on April 23, 303. It is told that he fought and killed a fierce dragon, and thus saved a Princess from death, so St. George is always represented in his combat with the dragon, he being on horseback, carrying a red cross on white ground. This cross became the national flag of England and was the



"I DON'T SUFFER ANY MORE"

"Feel Like a New Person," says Mrs. Hamilton.

New Castle, Ind.—"From the time I was eleven years old until I was seventeen I suffered each month so I had to be in bed. I had headache, backache and such pains I would cramp double every month. I did not know what it was to be easy a minute. My health was all run down and the doctors did not do me any good. A neighbor told my mother about Lydia E. Pinkham's Vegetable Compound and I took it, and now I feel like a new person. I don't suffer any more and I am regular every month."—Mrs. HAZEL HAMILTON, 822 South 15th St.

When a remedy has lived for forty years, steadily growing in popularity and influence, and thousands upon thousands of women declare they owe their health to it, is it not reasonable to believe that it is an article of great merit?

If you want special advice write to Lydia E. Pinkham Medicine Co. (confidential), Lynn, Mass. Your letter will be opened, read and answered by a woman and held in strict confidence.

BETTER THAN SPANKING

Spanking does not cure children of bedwetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W. 309, Windsor, Ont., will send free to any mother her successful home treatment, with full instructions. Send no money but write her to-day if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.

DOAN'S KIDNEY PILLS

Relieve The Kidneys and Bladder Like Ordinary Medicines Do The Bowels.

When the kidneys get out of order the back is sure to become affected, and dull pains, sharp pains, quick twinges all point to the fact that the kidneys need attention.

Plasters and liniments will not cure the kidneys, for they cannot get to the seat of the trouble, but Doan's Kidney Pills do, and cure the kidneys quickly and permanently.

Mrs. Lizzie Melanson, Plympton, N.S., writes: "I am sending this testimonial telling you what a wonderful cure Doan's Kidney Pills made for me. For years I had suffered so with my kidneys I could hardly do my housework. I used several kinds of pills, but none of them seemed to be doing me any good. At last I was advised to try a box of Doan's Kidney Pills. When I had taken the first box I found relief. I have used five boxes, and to-day I feel like a new woman. I cannot recommend them too highly."

Doan's Kidney Pills are 50c. per box, 3 boxes for $1.25, at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

When ordering direct specify "Doan's."

T. W. BOYD & SON,
27 Notre Dame St. West, Montreal.

ground work from which the present Union Flag has been built.

The cross of St. Andrew was joined with the cross of St. George in 1606 by King James I. St. Andrew is supposed to have been the first to introduce Christianity into Scotland. His anniversary is kept up by the Scotch on the 30th November. In the year of 987 the Scots were attacked by the English under Athelstane, there appeared in the sky the night before the battle the cross of St. Andrew formed in the white clouds against the dark blue sky, at the battle the English were defeated and their king was slain; since then the cross of St. Andrew has been adopted by the Scotch as their national flag; the St. Andrew's cross is a diamond cross, white on dark blue ground. This flag was carried by Robert the Bruce, whose descendants, the Earls of Elgin, still bear his banner; it was also carried at Bannockburn when the Scots were victorious over the English. The Scotch flag was carried principally on land, as the Scotch never made any pretentions of having a navy.

The origin of the flag called Jack cannot be clearly accounted for.

There was no change made in this flag until the year 1707 in the reign of Queen Anne when the union of England and Scotland and their parliaments became an established fact, so it was necessary to have one flag to represent the union.

The drawing of the new Union Jack of Queen Anne shows quite a difference from that of King James. This flag continued to be used for nearly one hundred years until Ireland came into the union in 1801.

St. Patrick from very early times has been the patron saint of Ireland; born in Scotland near the close of the fourth century (authorities differ as to the exact date of his birth).

He went to Ireland when a young man and devoted himself to Christianity and labored incessantly among the people, suffering many hardships.

He founded monasteries, churches and schools, was afterwards made a deacon and priest, and finally a bishop.

It is certain that he did a great lot of good for the Irish, and in as much revered as their saint by them as St. George by the English or St. Andrew by the Scotch. St. Patrick's Day, March 17th, is always especially celebrated by the Irish. There is no early record of this flag being carried in battle by the Irish, and they were never a nation fond of the sea, but it is quite certain that the Irish cross was in some way connected with St. Patrick.

The St. Patrick's cross is the same shape as St. Andrew's, but a red cross on a white field.

Thus we have the three flags in one Union Jack, the flags of England, Scotland and Ireland.

The part of the flag next the flagstaff is called the hoist, the outer part the field or fly; flags are generally hoisted at eight o'clock in the morning.

They are lowered to half mast as a sign of mourning, but should then be only the width of the flag from the top of the flag to staff.

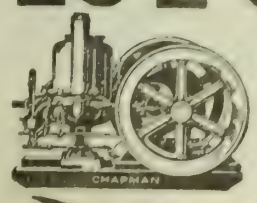
Salutes are made at sea by dipping or lowering the flag and then raising it, and in this connection it may be interesting to note that all nations are the first to salute British ships at sea as a recognition that Great Britain is "Mistress of the Seas."

"You may call it an old bit of bunting,
You may say it's an old colored rag,
Yet freedom has made it majestic,
And time has enabled the flag."

MAMIE I. RYAN,
Sussex.

Makes It Pay

Farming pays. It pays better than any other investment. The way to make it pay easier and bigger than ever is to get our mechanical farm helps to do more of your work at reduced cost. This requires POWER and it requires MECHANICAL EQUIPMENT, but power equipment is what "makes it pay." We offer the best in our lines at most reasonable prices.



CHAPMAN ENGINE This powerful handy farm engine does all kinds of work, pumping water, sawing wood, running a cream separator to a grindstone or fanning mill. It will run anything on the farm that requires power. Just start the engine and it hastens you from the work that is doing the work in hand or to some entirely different work, anywhere. It has been the means of enormous saving in labor and time. In our "CHAPMAN" Engine, the reliable timing device is adjusted by the governor at the factory and, together with governor and valve gear, is protected from injury in a cast-iron cam box. You save precious time and expense and secure long, uninterrupted, perfect service by the more than ordinary precision and constructive and material quality of the CHAPMAN ENGINE. **Write for our Booklets on Engines for Farm use**

Do you remember how our fathers used to toil 20 hours a day, for weeks, to get the harvesting done? That was when the harvest was cradled and bound by hand. You no longer hear of gleaning all night by the light of the harvest moon. The reaper and binder have changed all that. The ordinary chores in farm life have lost their drudgery too. Pumping water for house and barn, grinding feed, pulping roots, churning, washing, and cream separating, are not done by hand any more. Gasoline engines or windmills furnish power to turn machinery and pump water. We manufacture and supply nearly all the helps needed to make farm life easy: Saw Frames, Grinders, Silos, Silo Blowers, Well Drills, Pumps, Water Systems, Litter Carriers, Windmills, Engines, etc.

TORONTO Windmill A perfectly balanced easy running mill, geared and steady power for pumping. The TORONTO Windmill has self-adjustment to prevent racing in high wind. Requires oiling once a month.

TORONTO Economy SILO The TORONTO Economy Silo is constructed with the best [illegible] and is made by our Tank experts, who make 90% of the tanks in Canada. 2-inch [illegible] air-tight doors and windows easy to put in and take out. Shipped ready to set up. Get our prices.

Ten Sanitary Commandments For Rural Schools.

In every school which may be considered passably sanitary the following condition shall obtain;

1. Heating by at least a properly jacketed stove. (No unjacketed stoves to be allowed.) Avoid overheating. Temperature should never go above 68F. There should be a thermometer in every school room.

Ventilation by open windows when wether permits and by opening of windows at frequeut intervals even in winter.

Lighting from left side of room (or from left and rear through winow space at least one-fifth of floor spacc in area.

3. Cleanliness of school as good as in the home of a careful house keeper.

4. Furniture sanitary in kind, and easily and frequently cleaned.

Seats and desks adjustible and hagienic in type.

5. Drinking water from a pure source provided by a sanitary drinking fountain.

6. Facilities for washing hands, and individual towels.

7. Toilets and privies sanitary in type and in care (with no cesspools unless water tight)and no unneglected privy box or vanlts.

8. Flies and mosquitoes excluded by thorough screening of schoolhouse and toilets.

9. Obscene and defaceing marks absolutely absent from schoolhouse and privies.

10. Playground of adequate size for every rural school.

Bread and Cereals.

The cereals or grain products, buckwheat, corn, rice, rye, oats and wheat, furnish for the majority of people more nutriment than any other type of food material. It is estimated that they furnish more than two-thirds as much protein as all other food materials together.

They are especially valuable as energy producers and as one of the cheapest sources of protein. They also contain a very small proportion of refuse,are palatable and digestible,easily prepared and preserved.

As an arcticle of food for children and invalids,they are indespensable.

Thorough cooking of cereals is a factor of prime importance. It not only makes the ceaeal more palatable,but breaks down the cell walls of indigestible cellulose which surrounds the starch,grains and other nutriens,thus making them easier to digest.

Wheat is the most importent cereal because of its bread.making qualities. The two common classes of wheat are the "soft" or winter wheat and the "hard" or spring wheat. As a rule, the hard wheat contains more protein, while the soft wheat contains more starch

However, the amount of potein does not necessarily determine whether a flour will make good bread or not. The chief pretein in wheat flour is called gluten and is made up of two compounds, gliadin and glutenin. The proper proportion of these two compounds present in gluten as well as a fairly high glut. en contents, makes a good bread flour. It is the gluten in the wheat which has the property of stretchnig and expanding and which makes the framework of the bread,since it retains the air and carbon dioxide and hardens when baked. A good bread flour is creamy in color aud has a characteristic granular feeling and a high persentage of gluter. . A combination of winter and spring wheat is usually considerated the best for bread-masing.

Score-card for judgeing bread:

Flavor. 35; lightness 15; grain and texture,20;crust, 10:total, 100.

The flavor is determined by taste and color. Bread should have the good, nutty sweet flavor of the grain. A sour or yeasty smell is not allowable. Lightness is determine by the relation of size and volume. The bread should be neither overlight nor underlight, Grain and texture are jupged by the finess and tendernass of the loaf. There should be an even distribution of the

Nervous & Sleepless

Take 2 Tablets at Bedtime and you will arise feeling Refreshed, Bright & Vigorous.

When you feel gloomy and depressed and cannot sleep, suspect your nerves. When you shrink from company and would rather be alone you are losing confidence in yourself, and that can only mean weak nerves. It is not natural to be solitary and unsociable, it shows clearly that vitality has become reduced, and the nervous system correspondingly weakened. But take Dr. Cassell's Tablets for such a condition and you will be astonished at the results, astonished at the bright new health you will gain, at the splendid vigour and vitality they will give you.

Mr. Poole, a business man of 60, Infirmary Road, Sheffield, England, says :—"I had lost all confidence in myself, and was actually afraid to meet people. The alertness and activity I had formerly possessed were gone. My digestion was feeble, and sleeplessness was terrible. But when I commenced taking Dr. Cassell's Tablets I soon felt better. Now I am as well and fit as any man of my age."

Dr. Cassell's Tablets are Nutritive, Restorative, Alterative, and Anti-Spasmodic, and of great Therapeutic value in all derangements of the Nerve and Functional Systems in old or young. They are the recognised modern home remedy for Nervous Breakdown, Nerve and Spinal Paralysis, Infantile Paralysis, Rickets, St. Vitus' Dance, Anæmia, Sleeplessness, Kidney Disease, Dyspepsia, Stomach Catarrh, Brain Fag, Headache, Palpitation, Wasting Diseases, Vital Exhaustion, Loss of Flesh, and Premature Decay. Specially valuable for Nursing Mothers and during the Critical Periods of Life.

Druggists and Dealers throughout Canada sell Dr. Cassell's Tablets. If not procurable in your city send to the sole agents, Harold F. Ritchie & Co , Ltd., 10, McCaul Street, Toronto; one tube 50 cents, six tubes for the price of five War Tax Extra, 2 cents per tube.

Britain's Greatest Remedy

SISTER: READ MY FREE OFFER.

I am a woman.
I know a woman's trials.
I know her need of sympathy and help.

If you, my sister, are unhappy because of ill-health, and feel unfit for household duties, social pleasures, or daily employment, write and tell me just how you suffer, and ask for my free ten days' trial of a home treatment suited to your needs; with references to Canadian ladies who gladly tell how they have regained health, strength, and happiness by its use. I want to tell you all about this successful method of home treatment for yourself, my reader, for your daughter, your sister, or your mother. I want to tell you how to cure yourselves at home at trifling cost, and without aid from anyone. Men cannot understand women's sufferings; what we women know from experience, we know better than any doctor; and thousands have proved there is hope even for the hopeless in my method of home treatment, if you suffer from pain in the head, back, or bowels, feeling of weight and dragging down sensations, falling or displacement of internal organs, bladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly or irregularly, bloating or unnatural enlargements, catarrhal conditions, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living, I invite you to send to-day for my complete ten days' treatment entirely free and postpaid, to prove to yourself that these ailments can be easily and surely conquered at your own home, without the expense of hospital treatment, or the dangers of an operation. Women everywhere are escaping the surgeon's knife by knowing of my simple method of home treatment, and when you are cured, my sister, I shall only ask you to pass the good word along to some other sufferer. My home treatment is for all,—young or old. To Mothers of Daughters, I will explain a simple home treatment which speedily and effectually cures green-sickness (chlorosis), irregularities, headaches, and lassitude in young women, and restores them to plumpness and health. Tell me if you are worried about your daughter. Remember it costs you nothing to give my method of home treatment a complete ten day's trial, and if you wish to continue, it costs only a few cents a week to do so, and it does not interfere with one's daily work. Is health worth asking for? Then accept my generous offer, write for the free treatment suited to your needs, and I will send it in plain wrapper by return mail. To save time you can cut out this offer, mark the places that tell your feelings, and return to me. Write and ask for the free treatment to-day, as you may not see this offer again. Address:

gas, making fine and uniform holes.

No heavy streaks should occur. the crust ehould be even, yellowish brown in color, about one-fourth of an inch in depth, and should be crisp. The crumbs should be creamy in color, neither excessively dry and crumbly nor doughly. The loaf should be shapely and small enough to be thoroughly cooked. — Frances R. Freeman, in Maine Farmer.

Home Nursing.

There are few women who are not called upon at some time to care for the sick. The importance of goods nursing cannot be overestimated. In many cases the recovery of the patient depends more upon more upon the care in nursing and in following the doctor's instructions than in medical skill.

Nursing is not done by instinct, although instinct often helps, but it is done by thorough knowledge.

The things necessary for health are: (l) Pure air—for impure air brings about a devitalized condition of the body, which makes it susceptible to disease; (2) sunshine and light; (3) proper food, which has been well cooked and thorouguly masticated; (4) rest, recreation and exercise; (5) cleanliness.

In the sick room, good air should be had day and night. This should be carefully adjusted to avoid direct drafts. As much sunlight should be let iato the rooms as the patient can stand, but it should be prorerly tempered to suit each individual case. Sunlight increases the vitality of the patient and decreases the vitality of disease germs.

The temperature of the sick room should be a little lower than in any ordinary lividg-room. In certain diseases, such as pneumonia typhoid fever and tuberculosis, the windows are kept wide open.

Cleanliness is absolutely essential, both in the sick room itself and in the personal care of the patient

For this reason, dust-collecting non-essentials should be taken out of the room. Quiet and cheerfulness are necessary to help the patient to recovery.

The common symptons of illness, or of any abnormal conditions in the body, are: Headache, acking back and limbs, nausea, coated tongue, diarrhoea, cough irritability of temper and listlessness, sore throat, or fever. If any of these are observed in members ot one's family some step should be taken at once to relieve the condition. A safe thing to do is to give a hot bath and put the person to bed, following this treatment with a dose of castoroil, if necessary. If any symptoms does not yield at once to home treatment, a good doctor should be consulted. This saves time and strength and often money.—Dorothea Beach, in Maine Farmer.

Patient—Doctor, what I need is something to stir me up—something to put me in fighting trim. Did you put anything like that in this prescription?

Doctor—No You will find that in the bill.

These Fifty Men

would be required to do the work that the Martin Ditcher and Grader will do in one day.

Any good Farmer knows that draining is one of the most profitable improvements that can be made on his farm, but it is usually difficult and expensive to get men or machinery to do it.

You can do as much ditching in one day with the MARTIN DITCHER AND GRADER as *50* men could do with picks and shovels and do it better.

Every Farmer in Canada should have

The MARTIN Farm DITCHER and Road Grader
(PATENTED)

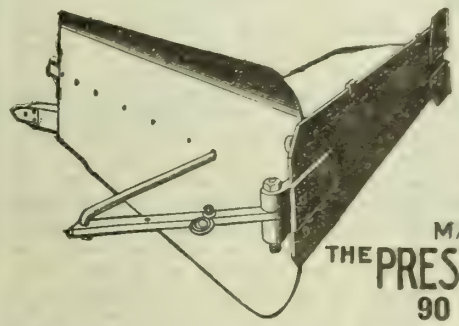
In fact he *cannot afford* to be without it.

It will cut ditches to a depth of two or three feet.

It will dig tile ditches and cover them up again.

It is unexcelled as a Road Grader—or for levelling land—making irrigation ditches, etc.

And the Price is only **$47.50**



Every machine fully guaranteed or money refunded.

Profits in a Suit of Clothes.

The cost of a suit of clothes from the back of a sheep to the back of a man is computed in the Tariff Board's report on wool as submitted to Congress last week, and the profits which accrue in the process are traced to their sources.

For the purposes of computation the board takes a suit of clothes retailing at $23 and wholesaling at $16.50. This is said to represent fairly the suit of clothes worn by the average American.

The farmer receives for the wool in such a suit $2.23, and his profit is 68 cents; the manufacturer of cloth receives for his product $4.78, and his profit is 23 cents; the wholesale clothing dealer receives for his product $16.50. and his profit is $2.18; the retail clothing dealer receives $23, tnd his profit is $6.50.

Angus W. McLeod Tells of His Luck.

FRIEND CALLED AND TOLD HIM OF DODD'S KIDNEY PILLS.

He Found a Cure for the Rheumatism That Crippled Him, and Has Never Since Had a Twinge of Pain in Limbs or Body.

Tarbotvale, Victoria Co., N.S., May 8th. (Special.)—Cured of rheumatism that had crippled him, Angus W. McLeod, well known and highly respected here, feels it his duty to let everybody know that he found his cure in Dodd's Kidney Pills.

"Last fall," Mr. McLeod states, "I took sick with a severe attack of rheumatism. The rheumatic pains lodged in the small of my back and left hip.

"I could feel darts of pain shooting through my loins liks shocks from a galvanic battery, and in two days I was a cripple. I was obliged to limp around with a stick, and I looked slewed to the right side because I could not let my weight on my left foot.

"I suffered in this way for a week, when luckily a friend came to see me who recommended Dodd's Kidney Pills. Before I had finished the second box the pain was entirely gone.

"I have since been exposed to cold and wet every day, but I haven't had a twinge of pain in my body or limbs."

Dodd's Kidney Pills cure rheumatism by removing the cause. They put the kidneys in shape to strain all the uric acid out of the blood. With no uric acid there can be no rheumatism.

Pork Cake a Good Substitute for Fruit Cake

Pork cake is a very good substitute for fruit cake. It is moist, keeps well and requires no butter, milk or eggs. The recipe:

1 pound fat salt pork.
1 pint boiling water.
2 cups sugar.
1 cup molasses.
1 teaspoonful soda.
1 teaspoonful cloves.
2 teaspoonsfuls cinnamon.
1 pound currants.
1 pound raisins.
1-4 pound citron.
flour.

First prepare the fruit. Wash and .ry the currants. Wash, seed and chop the raisins. Shred the citron. Have the pork entirely free from lean and rind. Chop very fine or put through the food chopper, using the finest cutter. Pour the boiling water over the chopped pork, add the sugar, mix the soda with the molasses and add the molasses. Mix the spices with part of the flour and stir into the mixture. Add the fruit and then the rest of the flour.

amount of flour is given but the batter should be as thick as one can stir. It is well to try a sample cake as one seldom uses enough flour the first time.

Bake in a moderate oven from three to four hours, depending on the size of the pans used, or steam three hours and bake one.—Charlotte E. Carpenter.

To Render Down Pork, Bacon or Other Fat.

Remove from it every scrap of lean meat (which should be put in to boil down for a stock or gravy), cut or chop the fat small, put it then in an iron saucepan, and cover with cold water. Bring slowly to a boil, skim off any scum that rises, then boil the whole very fast—without a lid—till all the water evaporates, that is, when the liquid is a clear oil. The operation take from two to three hours, but it must be watched or it will burn. When all the water has evaporated as stated, the pan must be drawn to the side of the fire so that the fat may go on melting at a very low heat. It must on no account be allowed to brown, and it should be frequently stirred. When the pieces of fat become shrivelled and crips it is ready. Draw back the pan and let the fat cool a little (boiling fat poured into earthenware will crack it), then strain it through a cheesecloth. In rendering down "flead" (pig's fat) or beef flare, water should not be used. Take off merely the thin skin, cut the fat up small, and put it into a brown earthen jar. Half fill it into a brown with boiling water, put in the jar when the water boils up, and boil fast during the whole time it is on the fire. Pour the melted fat gently into stone jars. Put the remains of the fat again on the fire, boil, and then pour off, but do not mix this with the first lot, if you do the lard will not keep so long.

How to Dress Hot-House Lambs.

Leave the hide on. Cut open carcoss from the neck to the hind leg—don't cut through the hind quarters, as the meat is apt to turn dark. The entrails should be properly cleaned out. Bladder must be removed. Leave nothing but kidneys during hot weather. During cold weather liver and heart and kidneys can be left in. Back-set the hide and draw the caul fat over the back-sets. Leave head and feet on. Lambs should weigh not less than 20 lgs. When too small they are not wanted.

As lambs are received mostly in the spring, and sometimes in early summer, when weather is hot and sultry, accompanied with frequent thunder

Get a Frost & Wood Mower

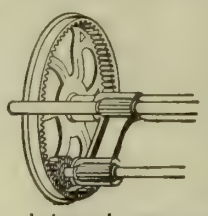
Use a cranky, wasteful out-of-date mower and you may throw away a whole season's hay. These are the days for efficiency. Make a wise expenditure for a Frost & Wood Mower, and you save in crop, in horse flesh, in time, in money.

Hay-Time is Money Time on the Farm

Frost & Wood Mower Cuts Any Crop

IT WON'T FAIL YOU.—It's a light draft machine. The splendid roller bearings and easily controlled levers eliminate friction and make it easy for a boy or girl to use. Immensely strong, with heavy brass bushings where wear is greatest. Heavy high-carbon steel cutter bar can be set in a second at any angle. Knife guards are high-grade tough malleable iron. The F. & W. is a splendid, serviceable mower, always ready for hard work, even with "green" help.

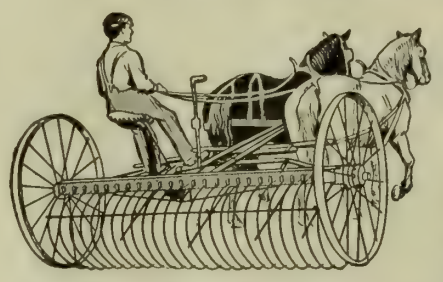
Space prevents reference to the many splendid features of the Frost & Wood Mower, but the "Internal driving gear" as shown here must be mentioned. The driving gears are meshed on the inside of the main drive



Internal gear drive means big power

—travel in the same direction—no tendency to fly apart, or to snap cogs—no loosening or rattling of parts and connections, and the knives begin to cut at the first step of the horses. This means quicker work and longer life to the machine.

Frost & Wood Rakes



Built for Hard Quick Work

Because a Rake looks a simple machine to make don't put up with cheap, inferior workmanship—get a F. & W. and save real money. Teeth of special quality, tempered steel, and arranged in convenient sections of two or three. Self-dumping, discharging load automatically at light pressure on foot lever. Made of steel, amply strong, clean working, the F. & W. Rake gives a lifetime of splendid service.

Our nearest agent is ready to give you full particulars and advice on this or any implement, or write to-day to our nearest branch or head office for illustrated catalogue.

FROST & WOOD CO., Limited,
MONTREAL, SMITH'S FALLS, ST. JOHN

Farmers and Wool Growers
ATTENTION!

We are open to buy any quantity of Washed and Unwashed Wool, paying the highest Market Cash Prices.

We pay freights to Humphrey's Station on all lots of 100 pounds or over.

On application we will be pleased to furnish current rates.

J. A. HUMPHREY & SON, Limited,
MONCTON, N. B.

storms, shippers should be careful and allow the carcasses to cool off thoroughly before shipping, as they turn green very readily about the kidneys, and many lambs become almost worthless in consequence.

Country shippers should exercise more care before shipping. It would not be a bad idea to allow the lambs to be quiet and restful before killing, and then after killing allow the lambs to cool off properly and allow all animal heat to pass out of the body.

Business as Usual at G.T.P. Passenger Station, Montreal

Since the recent fire, traffic continues to be carried on without inconvenience or delay to the travelling public.

The temporary ticket-offices, baggage and waiting rooms are fully staffed and business is going on expeditiously. Trains are operated with customary regularity.

Larger accommodations to take care of the usual increase in traffic as the season advances will be ready in a few days.

Passengers using Bonaventure Station and the trains of the Grand Trunk Railway System are assured of the same satisfactory and courteous service as hitherto.

Time tables and descriptive literature, of the Grand Trunk Railway System will be supplied on application to J. H. CORCORAN, Travelling Passenger Agent, Moncton, N.B.

Waterproofing Boots.

Put one pound tallow and half pound resin in a pot on the fire. When melted and mixed warm the boots (they should be dryand clean) and apply the hot stuff with a painter's brush, until neither the sole nor the upper leather will take up any more.

If it is desired that the boots should take a polish, melt an ounce of wax with a teaspoon lamp black, and some day after the boots have been treated with tallow and resin, rub over them this wax in turpentine, but not before the fire. The exterior will then have a coat of wax alone and will shine like a mirror.

Tallow or any other grease becomes rancid and rots the stitching as well as the leather, but the resin gives it an antiseptic quality which preserves the whole.—Mabel Page, New Hampshire.

Sealing Catsup Bottles.—When making catsup try tying waxed paper over the necks of the bottles tightly, then dip the tops in melted sealing wax. Your catsup will keep splendidly, besides the paper is more satisfacthan corks.

Catching Mice.—It may be some housewives are bothered with mice and are tediously baiting traps and placing them at points where the mice have been working. By locating the hole where the rodents made their entrance into the room and then placing an unbaited trap with the trigger end tight against the baseboard or wall they will be caught nearly every time.

Removing Scortched Spots. — If a piece of white goods is scorched while ironing it the discoloratian can be immediately removed by rubbing over it a cloth dipped in diluted peroxide.

If you wash matting with salt water it will pverent it from becoming dark colored.

—Removing Hot Dish Marks.—To remove these marks from furniture take equal parts of linseed oil and turpentine, rub on the wooden top. This removes the white stains. Where the surface is highly polished try a thin solution of olive oil and salt, spreading it over the mark left. Leave it there for one hour before polishing with a dry cloth.

For the home where there is no Gas

This is the first combination coal, wood and OIL, stove ever offered. It is 3 stoves in 1.

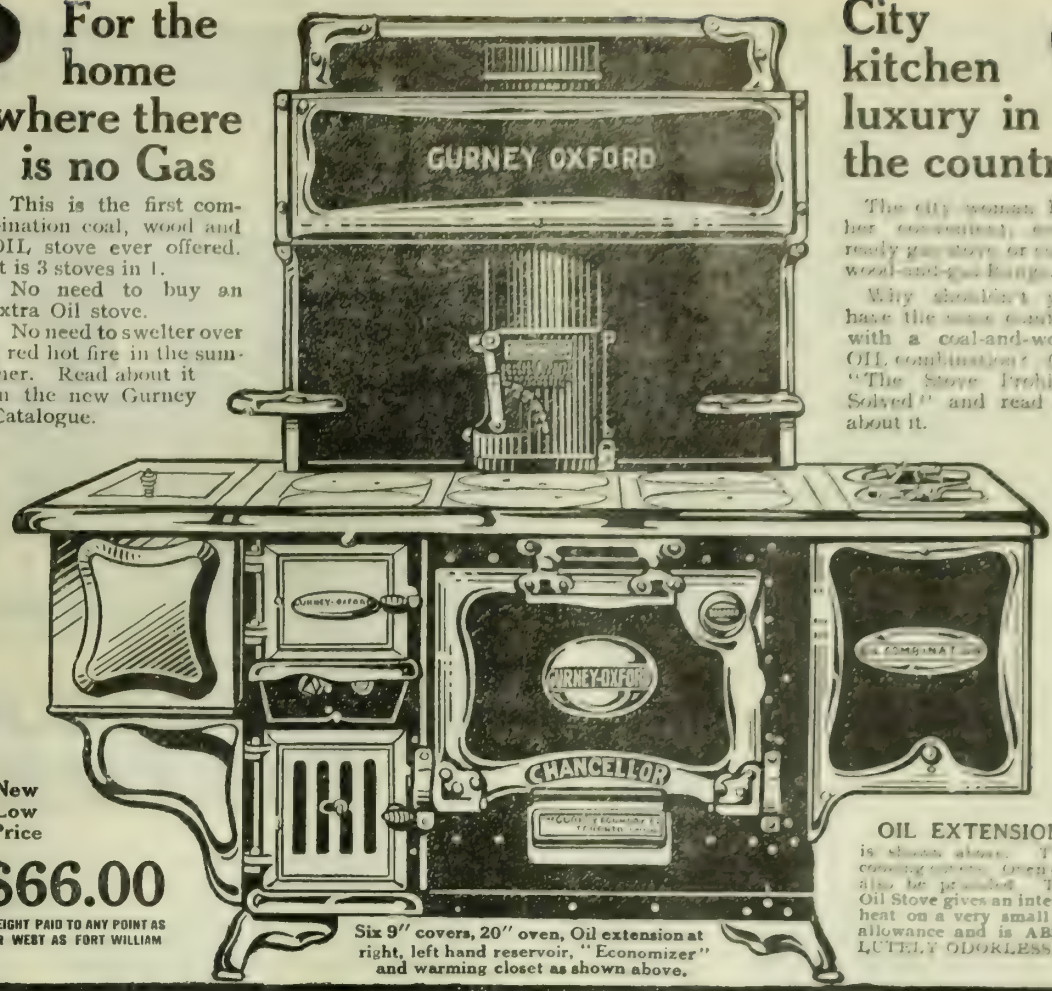
No need to buy an extra Oil stove.

No need to swelter over a red hot fire in the summer. Read about it in the new Gurney Catalogue.

City kitchen luxury in the country

The city woman has her convenient, ever ready gas stove or coal-wood-and-gas range.

Why shouldn't you have the same comfort with a coal-and-wood OIL combination? Get "The Stove Problem Solved" and read all about it.



New Low Price

$66.00

FREIGHT PAID TO ANY POINT AS FAR WEST AS FORT WILLIAM

Six 9" covers, 20" oven, Oil extension at right, left hand reservoir, "Economizer" and warming closet as shown above.

OIL EXTENSION is shown above. Two cooking covers (extra) can also be provided. This Oil Stove gives an intense heat on a very small oil allowance and is ABSOLUTELY ODORLESS.

This Chancellor Oil Combination is a wonderful new creation

In one splendid range are combined the finest coal and wood range, the Chancellor, with the best Oil stove built. It's the one great, new advance in stoves in the last 50 years. It's the one satisfactory all-year-round cook stove.

The Gurney-Oxford Chancellor is the finest possible product in the stove world to-day. Its beautiful blued-steel construction, ruggedly braced for many years of work, with hand-set steeple headed rivets, rich but simple nickle trims, makes it a beautiful sight in any kitchen. Everything about the "Chancellor" bespeaks the aristocrat in stoves.

Our patented system of dividing the flues *compels* the fire to heat every cover alike and, further, guarantees that every inch of the oven gets the same heat, producing splendid, even baking, not for a while or now and again but *always* and for a lifetime.

The "Economizer," a patented draft-control, is a wonderful feature. You can turn the heat off and on with a turn of the handle. No bother with dampers. Gives exactly the heat you want for any cooking or baking. Saves you a full ton of coal in 5. Holds a coal fire for 36 hours.

Fire box, special design, is fitted with unique Duplex Grates that get the utmost heat from the fuel you wish to burn, either wood, hard or soft coal.

The warming closet, broiler top and the beautiful enamelled surfaces all *lure* one to cook on the finest Range built, especially as prices are now lower.

The Oil Extension is every whit as satisfactory. You can use it at the same time as the main stove if desired. Special construction guarantees no oil smell. The white enamelled chimneys concentrate the intense heat and permit no waste.

Large, level, table-like top very handy in any kitchen, yet the "Chancellor" Combination Oil is compact and takes less room than two separate stoves. Also, you get 100 days after buying to decide whether you'll keep it or get your money back. Could you be protected further?

New Catalogue "The Stove Problem Solved" Get it

A splendid guide to stove buying compiled from 70 years' successful experience in making quality stoves. Gives complete particulars of the "Chancellor Oil Combination" above and also of the complete line of Gurney-Oxford Stoves, Ranges, Heaters, Gas Stoves, Boilers, etc., etc., and quotes new, low freight paid prices all through. There is a copy ready for you, *Free*. Send for it to-day. 57

Also at Toronto, Hamilton, Winnipeg, Calgary, Edmonton, Vancouver.

FULLY IDENTIFIED.

"But I don't know you, madam," protested the paying teller, to a woman who had presented a cheque. The woman, instead of replying haughtily, "I do not wish your acquaintance, sir," merely gave him a glassy smile, and said:

"Oh, yes, you do. I don't need any one to identify me. I'm the 'red-headed hen' next door to you, whose 'imps of boys' are always running across your garden. When you started to town this morning, your wife said: Now, Henry, if you want a dinner fit to eat this evening, you'll have to leave me a little money. I can't keep this house on Christian Science.'"

"Here is your money," interrupted the paying teller, faintly.—Kansas City Journal.

Features Gleaned From the N. B. Women's Institute Reports

(Continued from page 491.)

Stuart Fiske, Quebec, who only a short while ago, was closely connected with Macdonald College, Quebec, gave our housekeepers, nay homemakers, many ideas of ways and means whereby household difficulties might be overcome together with the salvation of time and strength. A paper on "Bacteria and Its Relation to Foods," was carefully prepared for us by Miss Beulah Phillips, a graduate in Household Science at Mount Allison. Truly the old saying, 'Everyone must eat his peck of dirt' does not belong to the 20th Century housewife.

A paper on "The Advisability of Partonizing Home Industries" written by Mrs. Herbert Kilpatrick, awakened many of us to the opportunities lying close at hand which ought to be taken advantage of. Mrs. Kilpatrick has also given us a splendid paper on "Obedience in Children." Discipline always, but discipline wisely. Another paper which proved very interesting was "Should a Wife Know Her Husband's Business?" which was well prepared and given by Mrs. Atkinson. In the words of Tennyson's Princess,—"Everywhere two heads in council, two besides the hearth, two in the tangled business of the world, two in the liberal offices of life." Many more subjects might I mention, but time will not permit.

To help digest these literary feasts, we have music and cheery readings. The roll call is usually answered when possible by quotations bearing on the month in question, as Valentine quotations in February, Irish quotations or jokes in March, Patriotic quotations in May, etc. Right here let me mention that in March we enjoyed a pleasant evening with Miss Jonah, who instructed us in "The Care of a Typhoid Patient." At many of our meetings refreshments are served by committees appointed for that purpose, and on "Gentlemen's Evening," when the programme is prepared especially for them, each member helps to provide for the inner man.

Truly war has waged its wide desolation during the past year. Homes have been destroyed, lives sacrificed, for what—to satisfy man's greed for gain and furthermore to crush out that greed. We think our time precious to us. What of that? Were not the lives sacrificed at the battles of Marne, Ypres and St. Julien precious too. Much have those lives done for us and the most we, snug in our comfortable homes, can do is small recompense.

Florenceville Society admits it has done very little, but the coming year, I can assure you, will see much done. Knitting socks and the making of hospital shirts and pajamas have kept our members quite busy during the past months. Twenty Dollars was raised by the sale of 'Allied for Right' buttons and forwarded for the Women's Institute Motor Ambulance Fund. Out of funds on hand, consisting of fees, proceeds of sale of refreshments at our annual pic-nic in July, amounting to $30.50, $7.05 our share of the Carleton Masonic Lodge contribution, $6.65 another share we received from a generous neighbour merchant's week's sale of goods together with our government allowance, 50.00 was voted to join an Institute Machine Gun fund. This, however, has been cancelled and the money is still on hand ready to be devoted to whatever worthy object is presented to us.

"The will to do and the will to dare
Are what we want to-day.
What has been done can be done again,
For the will finds out the way."

Glassville. — Organized September, 1913. Membership then 8, now 23. Refreshments served at the close of each meeting are provided by a committee of four, appointed at the preceding meeting. This branch had a printed programme last year, but so many demands for money during the war the programme this year was typed. Annual pic-nic greatly enjoyed by the members and their families. Money has been raised from sale of ice cream and suppers. Contributions were sent to the Patriotic and Ambulance Funds, and food and clothing to the Belgians. Many helpful ideas obtained from the Canadian Home Journal, taken by several of the members. Two members from this branch took advantage of the Household Science Short Courses held at Woodstock by the Department, and were able to share their knowledge with the other members at the monthly meetings of the Institute. Last year the Women's Institute had a special exhibit at the local Agricultural Exhibition.

Hartland. — Organized September, 1913. Membership at present, 24. Papers on such subjects as "First Aid to the Injured," "The Early History of

LIFE INSURANCE FOR YOUR HOUSE

Unpainted wood means decay. Not to paint your house, means constant expense for repairs. Paint protects against wear and weather. When you take out our "100% Pure Policy", your house is insured against decay. Such paint protection resists the destructive effects of climate and temperature, besides adding beauty and distinction to the home and value to your whole property.

MARTIN-SENOUR "100% PURE" PAINT

means life insurance for your home. The genuine White Lead, Oxide of Zinc, Pure Colors and Linseed Oil—ground to extreme fineness by powerful machinery—form a combination that protects against decay.

"100% Pure" Paint makes protection sure. It spreads easily, covers completely and is the cheapest in the end because it covers more space per gallon. In all colors for spring painting.

Write for a copy of our amusing book, "The House That Jack Built." It's full of pictures, rhymes and reason, that you will enjoy as well as the children. We'll also give you the name of our nearest dealer-agent.

FOR SALE BY
J. CLARK & SON - FREDERICTON, N.B. AND WOODSTOCK, N.B.
THE LOUNSBURY CO. - - - - - - - - - - - - NEWCASTLE, N.B.
BLIGH & PRINCE - - - - - - - - - - - - - TRURO, N.S.

Canada," "Our National Anthem," "The Value of Self-Control," "The Proper Ventilation of our Homes," and many others of varied interest have been read from time to time. Two hundred and forty pairs of socks and other useful articles have been sent to the soldiers. One of the important undertakings in this branch was the installing of seven gasoline street lights. Funds for their upkeep were raised in the following manner: Concert, $57.00; Tag Day, $62.63; Food sale, $16.00; Auction in connection with a Patriotic Pic-nic, $116.00. The local Lodge of the Knights of Pythias donated $50.00 to further encourage and show their appreciation of the local improvement undertaken by the Institute.

Upper Kent. — Organized October, 1914, with a membership of 15. Work almost entirely confined to assisting the soldiers. As a result of a Social, $30.00 was forwarded to the Soldiers' Disablement Fund. Printed program not in evidence, but at each meeting program for the following meeting is arranged. Sociability and interchange of ideas has been encouraged by the Institute.

Woodstock. — Organi ed February, 1915, with a membership of 38, which has since increased to 80. Meetings held in one of the lecture rooms in the new Vocational Buliding. At one of the meetngs Rev. Mr. Smith, a social service worker of Ontario, gave a very interesting account of the Ontario Women's Institutes. The meetings have been most instructive and interesting —the subjects taken up covering most phases of women's work in the home. A lesson on dressmaking,—a paper on the Cuts of Meat and the Most Nutritious Method of Cooking Them,"—Demonstrations in the making of Angel Cake, Potato Flouna Cake, Sherbet, Date Whip, etc., have made the regular monthly meetings an event to which all look forward with much pleasure. At one meeting a local butcher brought a side of beef, cut it, told the members the proper names of each part, and the prevailing prices of the different cuts. Other helpful addresses were given by Dr. Grant, on "First Aid," and Mrs. Chester O. MacDonald on "What a Woman should know about Banking." A "Clean Up" day was held in April, when the aid of the Boy Scouts, some of the clergymen, and the local newspapers, the town of Woodstock was made a bit more beautiful. The Musicale, given free of charge, during the month of June, was an unqualified success. neither expense nor labor was spared in order that the public might enjoy an evening of music. Twenty-nine Dollars and Sixty-six Cents, the receipts of Button Day, considerably swelled the N.B.W.I. Motor Ambulance Fund. Another place where Institute members are also Red Cross Members, but realizing that too much work cannot be done for the soldiers, the Institute handed over the Red Cross Society 85 pieces, and no doubt will continue in this noble work. To the picnic held in July, the husbands of the members, and the Boy Scouts were invited.

Potato Growing and the Maintenance of Soil Fertility

(Continued from Page 485.)

is not essential, for as we have already seen, there is already in our average soils sufficient potash to grow these crops for at least sixty years without the addition of any more, provided we continue to make this potash available from year to year by good cultivation, and on some soils, the application of lime. We can further add greatly to this supply by the use of the clover crop which has the faculty of sending its roots down into the subsoil and drawing on reserves there. It has been proven that a good catch of clover which will give two tons of hay per acre will add the following amounts of fertilizing elements by the decay of its roots alone, viz.:

Nitrogen, 60 lbs.
Phosphoric Acid, 20 lbs.
Potash, 50 lbs.

A ten years' test of clover given at the Central Experimental Farm has shown that the soil is continually getting richer by the growth of this useful crop, not only by the addition of Nitrogent but also by adding humus with all its advantages to the mechanical and bacteriolical qualities of the soil.

There is the experience of one of the most noted potato growers of the United States to show that the crop producing power of a rather poor rolling sandy loam in the western reserve of Ohio could be kept up and improved indefinitely by a three-year rotation. The clover hay and the grain and straw were all fed and used on the farm and the manure therefrom returned to the soil, while at the same time the potato crop was sold off annually for over thirty years without the purchase of one pound of commercial fertilizer. The owner of this farm, Mr. T. B. Terry has frequently told of his experience which confirms the conclusion above arrived at that we need not worry very much for the next 50 or 60 year about the potash supply in our soils if we feed all the crops on our farm, except the potatoes.
